INDEX OF CONTENTS

TO THE

GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE,

FOR 1854.

A.

Abelia uniflora, 662
Abies, Douglasi, timber of, 163, 237; Kæmpferi, 255, 455; Cilicia, 387
Acacias, 214; list of, 215; hardiness of, 595
Achimenes, culture of, 517
Acre, seed for an, 244, 541
Acrophyllum venosum, 645
Adamia versicolor, 404
Adams' Globe prepared for Man—a Guide to Geology, rev., 550
Æchmea fulgens, 741
Aeration, 19, 38, 53, 69, 357, 389, 405, 420, 437, 485; and ventilation, 501
Agents, land, 57, 60, 155
Ageratum mexicanum, 6
Agriculture, revolution in, 9; Gisborne's Essays on, rev., 13; Tullian, 35; Irish, 44, 569; and science, 75, 107, 123; and commerce, 171; and geology, 171; manures, advantageous to, 172; progress of, 171, 185, 204; stages of, 201; near Liverpool, 274; *v.* manufacture, 293; for the Million, rev., 203; products of, in the Crystal Palace, 345, 457; theory of, 459; steam, 457, 505, 508, 522, 796, 812; Lois-Weedon, 307, 377, 427, 521, 602, 804; Dr. Daubeny on ditto, 827, 842; Princetown, 650; Dartmoor, 188, 224, 364, 650, 667: Professorship of, in Edinburgh, 729; produce, increase of, 730; possibilities in, 730; in Ayrshire, 633, 697, 763; Mr. Mechi on British, 793, 796, 811; good, 793; capital required in, 796
Agricultural buildings, Lord Radnor's, 188; construction and arrangement of, 556
Agricultural chemistry, 292, 328, 410, 420, 492, 539, 554
Agricultural College, 425; experiments in the garden of, 43, 138, 222, 306, 619, 698, 714; and diplomas, 57, 123; sessional examinations, 410, 426, 539, 554, 571, 586
Agricultural diplomas, 57, 123
Agricultural education, 441, 442, 489, 491, 573, 684, 699, 714; French, 603; in Ireland, 700
Agricultural implements, 226, 395; hand hoes, 40; prizes for, at the Agricultural Meeting, 108; improved rollers, 141; root graters, 10, 107, 138; Samuelson's digger, 363
Agricultural labour, Morrison on, rev., 287: skilled, 604; ditto and moral, 620; rates of payment for, 669; economy in, 731, 746
Agricultural labourers, 171, 187, 525; education of, 60; food for, 28, 36, 43, 53, 86, 93, 101, 166, 196; relieving, 75, 100, 222; cottages for, 258; cookery of, 36, 196, 270; friends, 363, friend societies, 377, 379, 395, 537; shows, 633
Agricultural machinery, 13, 226; pulping, 138; stacking, 156; rotatory forking, 225; threshing, 226; reaping, 245, 413, 570, 617, 682
Agricultural meteorology, 155, 170, 217, 243, 259, 275, 290, 347, 363, 460; Martin's pamphlet on, 460
Agricultural statistics, 12, 41, 44, 74, 137, 153, 183, 205, 221, 226, 241, 325, 328, 378, 420, 492, 681, 701, 713, 732, 763; Canadian, 90; Levi on, 205, 226; Caird on, 226
Agricultural tour in Ireland, Martin Doyle's, 222, 326, 427, 505, 587
Air, importance of, to plants, 19
Algiers, Orange grounds of Blidah in, 420
Alloplectus Schlimii, 183; chrysanthus, 551
Allosorus flexuosus, 219
Allotment competition, Tortworth, 666
Almanac, Johnson's, Trade Directory of, 22; Scottish Agricultural, rev., 108, 708; Farm, rev., 749
Amaryllis, 405; treatment of, 696
Amateur Gardeners' Year Book, rev., 534
America, monies of, 6; a field for gardeners, 117, 182; shrubs in, 270; fungi of, 286; Osage Orange hedges in, 299; way of getting seedling prizes in, 551; pork manufacture in, 586; Rose hedges in, 583
American plants, at Regent's Park, 391; Waterer's Catalogue of, noticed, 839
American Birch, 792
American blight, 824
American Oaks, monograph of tropical, 504
American, Oak-gall Sphinx, 757
Amherstia nobilis, at Ealing Park, 87
Ammonia, purposes of in vegetable economy, 11; formation of, 59; uses of, 139, 243; origin of, 203; sources of, 427; from coal, 444; and nitric acid in rain water, 778
Anacharis alsinastrum, 406, 693, 724, 742
Analysis of Coveney's economical manure, 428
Anbury, 172, 538, 555, 571, 572, 636, 649, 665, 667, 683, 700, 747, 762
Andrews Modern Husbandry, rev., 189
Anemone japonica, 149
Angelonia grandiflora, 788
Anguloa Ruckeri, 271
Anigozanthos rufa, 532
Animals, Leidy's Flora within Living, rev., 218; indications of age in, 330, 348; Simonds on, rev., 588; cod-liver oil for, 412
Ansted's Notes on Geology, &c., rev., 662
Antipodes, memoranda from, 320, 755, 756
Antirrhinums, to winter, 710
Ants, to exterminate, 133, 150, 165
Aotus gracillima, 420
Aphelandra lateritia, 239; quarrosa Leopoldi, 303
Aphides, to kill, 552; on bedding plants, 517
Aphis blight and the weather, 829
Aphis rumicis, 550
Apples, storing of, 320; ditto in sawdust, 117; for west walls, 152; second crop, 742
Apricot, Musch Musch, 269; Japanese, 534; for a north-west aspect, 728
Aquarium, Crystal Palace, 344; Gosse's, rev., 422; artificial sea-water for, 661; experiments in a fresh water, 677
Aquatics, 518
Aquilegia glandulosa, 341; californica, 836
Aralia japonica, 760, 808
Araucarias, on chalk, 614; excelsa, 725
Arbutuses, hardiness of, 595
Arceuthos drupacea, 536
Archer's Economic Botany noticed, 791, 806
Ardisia crenulata, 132
Armagh Palace Farm, 620
Arnott's stoves, brick, 680
Aroideæ, hardy, 120
Artists, advice to, 220
Ash trees, in water, 165, 677
Asia Minor, trees of, 387
Aslit's Decimal Coinage, rev., 71
Asparagus, to plant, 760
Asparagus Kale, 536
Association, British, 661, 667
Auricula, treatment of, 39, 135; insects, 760
Australia, vineyards of, 756; wines of, 320, 755; state of horticulture in, 822
Ayrshire, Grass crops in, 633, 697; high farming in, 763
Azaleas, to force, 55

B.

Babingtonia camphorosmæ, 773
Bacon, to cure, 223
Balsamina latifolia alba, 21
Balsams, treatment of, 200
Bamboos, hardiness of, 595
Banks, savings, 779; scope for ditto, 618, 635; penny, 715, 747
Bark, management of, 659; Oak, 678, 694
Barley, harvest of 1853, 27; foreign, 156; sowing, 187; returns respecting the state of, 506; Peruvian, 588; averages, 667
Barns, Dutch, 107
Barometers, 56
Basing Park, noticed, 662
Bath Agri. Society's Journal, 173
Beans, harvest of 1853, 27; manure for, 93; returns respecting the state of, 506
Bean straw, for cattle feeding, 202; for pigs, 795
Beef, comparison of measured and actual weights of Smithfield, 11
Beehives, 632
Beer, economical, 460
Beer on Orchids, rev., 679
Bees, 134, 181, 197, 358; queen, 302
Beet, to store, 838
Beetle trap, 152
Begonia fuchsioides, 452; opuliflora, 567
Benthamia fragifera, 595, 694
Bentley Priory, noticed, 439
Berberies, hardiness of, 595
Bicton, winter at, 437, 501
Biddulph Grange, effects of frost at, 343
Billington (Mr.) and Chopwell Wood, 237; pamphlet on Royal Forests, 195
Birch, American, 792
Birch weevil, 101
Birds, British, 156; the woodcock, 389
Blidah, Orange grounds of, 420
Blight, Wheat, 19, 20, 280, 474, 505, 585, 588, 636; American, 824; Hop, 425, 429, 595, 611, 614, 829
Blight composition, M'Adam's, 324, 342; Page's, 565
Bochmeria nivea, 218
Bohn's (Mr.) garden, noticed, 487
Bones, composition of, 410; on Grass land, 765
Books, veterinary, 557; of agricultural instruction, 574, 750; dairy and poultry, 637
Books Noticed: Wilkinson's Ancient Egyptians, 6; Twining's letters on the Working Classes of Nassau, 6; Foreign Tour of Messrs. Brown, Jones, and Robinson, 7; Deane and Dray's Almanac, 7; Gisborne's Essays on Agriculture, 13; Grieve's Farmer's Assistant, 13; Rendle's Price Current, 23; Beauties of Byron, 23; English Cyclopædia, 23; Once upon a Time, 23; Jesse's Country Life, 39; Phillips' Guide to Geology, 54; Agricultural Society's Journal, 61, 444; Cuthill's Essay on the Potato, 61; Sunlight through Mist, 55; Lindley's lectures on the Symmetry of Vegetation, 55; Aslit's Decimal Coinage, 71; Weddell's Bolivia, &c., 86; Bon Jardinier for 1854, 87; Gorrie's Illustrations of Scripture from Botanical Science, 87; White's Selborne, 87; Paul's Supplement to Rose Garden, 102; Howitt's Pictorial Calendar of the Seasons, 102; London Corporation Coal Tax, 103; Collins on the Mangold Wurzel, 108; Scottish Agriculturist's Almanac, 108, 750; Payen on Food, 119; ditto on Diseases, 199; Black's Waverley Novels, 119; Reaping Machine Patents, 124; Lindley's School Botany, 135; Dove on Heat, 140; Hooker's Himalayan Journals, 150; do. Icones Plantarum, 255, 359; do. Flora of New Zealand, 287, 487; A visit to Belgrade, 167; Lance on Assurances, 167; Johnston's Chemistry of Common Life, 167, 375; Macaulay's Essays, 167, 255; Burn's Colonist's Handbook of Mechanical Arts, 167; Bath Agricultural Journal, 173; Robin on Parasites, 183; Dartmoor, Guide to, 188; Andrews Modern Husbandry, 189; Billington, How the Royal Forests have been Ruined, 195; Berkeley on the Potato Disease, 213; Leidy's Flora within Living Animals, 218, 582; Eaton on Pigeons, 226; Thomson's Cyclopædia of Chemistry, 239; Sutton's Instructions on the Cultivation of Seeds, 244; Hansard's Strikes and Lockouts, 219; Stainton's Entomologist's Companion, 255; Neill's Fruit, Flower, and Kitchen Garden, 255; Seeman's Botany of H.M.S. Herald, 255, 487; Hanstein's Structure of Bark, 255; Dickinson's Flora of Liverpool, 270; A Plain and Easy Account of British Ferns, 270; Schacht on Textile Materials, 270; ditto on the Functions of Cells, &c., 486; Synopsis Plantarum glumaceæum, 271; Morrison on Labour and Capital, 287; Glenny's Farming for the Million, 293; Simmond's Commercial Products of the Vegetable Kingdom, 300; De Bary on the Rust of Corn, &c., 303; Micrographic Dictionary, 323, 375, 455, 631; Woodward's History of Wales, 331; Forester's Essay on Portugal, 343; Lund's Geometry, 343; Pamphlet on Canada, its Condition, &c., 355; Brewster's More Worlds than One, 359; Rivers' Orchard-house and Rose Amateurs' Guide, 359; ditto Miniature Fruit Garden, 775; Tanner on the Cultivation of Dartmoor, 364; Spooner on Root Crops, 364; Doyle's Domestic Poultry, 364; Young on the Salmon, 375; Knight's Old Printer and Modern Press, 375; Hopkins' Theory of Storms, 391; Kennedy's Correspondence with Lord John Russell, 403; Bradbury and Evans' Handbooks to the Crystal Palace, 407, 615; Horton's Russia, 407; Harvey's Seaside Book, 422; Gosse's Aquarium, 422; Hogg on the Microscope, 423; Robertson's Handbook to the Peak of Derbyshire, 439; Sharp on Fibrous Substances, 439; Swete's Flora Bristoliensis, 455; Pescatorea, 455; Thompson's Wanderings among Wild Flowers, 455; Pictures from the East, 455; Martin's Agricultural Meteorology, 461; Highland Society's Journal of Agriculture, 492; Sowerby's British Ferns, 502, 631; Piercy's Popular Tales, 502; Murchison's Siluria, 518; Burgess's Amateur Gardeners' Year Book, 534; Bryologia javanica, 535; Tuinbouw Flora, 535; Wakefield Farmers' Club Report, 540; Adams' Globe prepared for Man—a Guide to Geology, 550; Tegetmeier on Profitable Poultry, 550; Knox on the Cholera-fly, 563; Soyer's Cookery, 566; Catlow's Conchology, 566; Simonds on the Age of Cattle, 588; Wilson's Report of the New York Industrial Exhibition, 605; Phillips' Guide to the Crystal Palace, 615; Census of Great Britain in 1851, 630; Brande on the Arts connected with Organic Chemistry, 646; Ansted's Scenery, Science, and Art, 662; Thomas on Farm Implements, &c., 668; Mactaggart on the Potato Disease, 675; Duncan's History of Russia, 679; Beer on Orchids, 679; Schiller's Catalogue of Orchids, 711; Stepping Stone to Animal and Vegetable Physiology, 711; A Visit to the Seat of War, 711; Frazer's Handbook for Ireland, 711; Meall's Moubray's Treatise on Poultry, 717; Burn on the Steam Engine, 732; Wollaston's Insecta Maderensia, 742; Johnson and Shaw's Farm Almanac, 749; Elliot's Fruit Book, 759; Stanford's Map of Sebastopol, 775; Archer's Œconomic Botany, 791, 806; Stark's British Mosses, 791; Page's Text Book of Geology, 791; Piscator's Choice and Cookery of Fish, 791; Village Development, 807; Rees' Diary, 807; Galbraith and Haughton's Manual of Mechanics, &c., 822; Reichenbach's Xenia Orchidacea, 822; Sowerby's Conchology, 839; Shortland's Traditions and Superstitions of the New Zealanders, 839; Waterer's Catalogue of American Plants, 839; Talpa, or Chronicles of a Clay Farm, 845; miscellaneous, 839

Botanical nomenclature, 38, 533
Botany, Dr. Lindley's School, 135; Seeman's, of H.M.S. Herald, rev., 255, 487; Archer's Œconomic, 791, 806
Botrytis fruit, 724
Botteri's (M.), arrival at Vera Cruz, 531
Bran, Wheat, 331
Brande on the Arts connected with Organic Chemistry, rev., 647
Brassavola cucullata, 758
Bread, price of, 44, 139; economical, 108; cheap, 122, 123; ditto, whole flour, 243; Wheaten, 187; making, 276; and paper, 276
Brewing, porter, 701
Brewster's More Worlds than One, rev., 359
British Association, 661, 677
Broccoli, Bates's, 86; wintering, 117
Brown (Mr.) appointment to the forest of Dean, 132; presentation to, 184
Brussels, effects of the frost at, 286; climate of, 774
Brussels Sprouts, to top, 568; from English seed, 774
Bryologia javanica, rev., 535
Bugs, cure for, 678; house, to kill, 728
Buildings, damp, 29; covered rick, 60, 76, 123; farm, Lord Radnor's, 188; construction and arrangement of do., 556, 828; damp walls in, 518, 533, 550, 598; cure for do., 491
Bull, Lord Ducie's Duke of Gloucester, 793
Burgess's Amateur's Gardeners' Year Book, rev., 534
Burn on the Steam Engine, rev., 732
Butter, rancid, 349, 750; potted, 461

C.

Cabbages, culture of, 599, 614
Calceolarias, 23, 103, 823; specimen, 119; culture of, 343; cross breeding, 776
Calla æthiopica, 200, 392
Callistemons, hardiness of, 595
Calyptraria hæmantha, 566
Camellias, to propagate, 551; imported, 760
Canada, agricultural statistics of, 90; condition of, 362; resources of, 692; wages in, 811
Capsicums, to grind, 504
Carnations, tree, 71, 323; to pot, 71; soil for, 240, 488; to layer, 583; to winter, 599, 760; running of, 839
Carrots, culture of, 244; finger and toes in, 588, 555, 571, 572, 636, 649, 665, 667, 683, 700, 747, 762; crop, 733
Caterpillars, to kill, 437; Gooseberry, 453, 469, 485; vegetable, 839
Catlow's (Mrs.) Conchology, rev., 566
Cattle, weights of, 10, 11, 26, 105, 117; does live pay? 12, 44, 76; to measure, 26; feeding, 123, 202, 244, 362, 781; Grass do., 602; profitableness of do., 58, 61, 107; food for, 813; consumption of, 525; prepared for, 569; spring do., 575; experiments with feeding of, with fermented, 277; gorse for, 44, 379, 428; Rape-cake for, 634, 651, 747; short-horn, 260; sale of do., 364, 620; pedigrees of do., 793, 826, 844; ages of, 330, 348, 379; Simonds on do., rev., 588; fat, 26; cod-liver oil for do., 412; at the Agricultural Society's meeting, 476; at Dublin, 260; pools, 491; grazing, 540; for a farm of 150 acres, 557; farming, 571; breeding, 715; report of, at the Smithfield Club, 794; do., at the Midland Counties, 810
Cattleya labiata, fine, 711; monstrous, 804
Ceanothus, hardiness of, 595
Cedar of Lebanon wood, 116, 118
Cedar wood of the ancients, 148, 164, 182, 214
Cells, Schacht on the functions of, rev., 486
Cement, 187
Census of Great Britain in 1851, rev., 630
Ceratochloa unioloides, 758
Cercis japonica, 183
Cereus, night blowing, 320, 373
Cerochilus rubens, 87
Ceropegia Thwaitesi, 70
Cesspools, to disinfect, 645
Ceylon, poultry of, 444; Botanic Garden, 563
Chætogastra Lindeniana, 582
Chalk, Araucarias on, 614
Champion, death of Col., 819
Charcoal, a deodoriser, 393, 395; peat do. Prof. Way on, 395, 503
Cheese, false colouring of, 292; making, Gloucester, 698; Cheddar ditto, 714; Wiltshire ditto, 761
Chemistry, Thomson's Cyclopædia of, rev., 239; analytical, 232; agricultural, 328, 410, 427, 492, 439, 554; Brande on, rev., 646
Chesnut (Castanea vesca), 712; horse, 360; hardiness of, 691
Cherry, Merry, 582
China, spring flowers in, 54; grass, 218
China Rose, introduction of, 344
Chinese, note book, 54, 217, 533, 758; Yams, as food, 467, 486, 820; Indigo, a new kind discovered, 217; timber, 598; fragrant ditto, 614; Primroses, 743; entomologists, 758; economy of manure, 845
Chiswick, gardens at noticed, 71, 135, 199, 287, 359, 423, 503, 582, 647, 711, 775; fall of rain at, for the years 1841 to 1853, 7; effects of the frost at, 287; fêtes at, 317, 339, 371, 451; reports of ditto, 321, 374, 453; list of awards at ditto for May, 316; for June, 370; for July, 450; rumours respecting, 499; temperature at, and at Stevenage, 790
Cholera and fungi, 627
Cholera fly, 563, 596
Chopwell wood, 709; and Mr. Billington, 237
Chrysanthemums, 219, 271, 455; lists of, 726, 775; Pompone, 743; new, 759; Mr. Salter's, 759; at Stoke Newington, 776, 791
Churns, improvement in, 365
Cider, false colouring of, 292
Cinerarias, culture of, 471, 679, 760, 791; large, 776
Citronworts, 583
Civilisation, benefits of, 668
Clay, burnt, a material for walks, 117, 134, 150
Clematis, azurea grandiflora, 72; patens, 183; hardiness of, 595
Clerodendron splendens, 165; Bungei, 376, 518; fœtidum, 533, 549
Clianthus puniceus, 101
Climate, and Gulf Stream, 42; of the West of England, 701; of the Crimea, 755, 771, 802; of Brussels, 774; of St. Malo, 774
Climbers, greenhouse, 536, 824
Clover and Vetches, 138; Italian, 585
Clubs, benefit, 377, 379, 395, 537, 715
Coal, ammonia from, 444; substitutes for, 822; amount of ash in, 829
Coal tax, London corporation, rev., 103
Cock-roach parasite, 533
Cod-liver oil, for fattening animals, 412
Coinage, Aslet's Decimal, rev., 71
College, Cirencester Agricultural, 425; experiments in the garden of, 43, 138, 222, 306, 619, 698, 714; and diplomas, 57, 123; sessional examinations, 410, 426, 539, 554, 571, 586
Collins on Mangold Wurzel, rev., 108

Peach trellises, 822
Pears, time for gathering, 676; Beurré superfin, 774, 789, 806, 838; Beurré Clairgeau, 805; Nutmeg, 822; Cumberland, 838
Pear trees, east wall, 88; M. de Jonghe on, 387. 676, 709, 741, 757, 773, 789, 805; new, 388, 404, 420, 436, 464, 484, 517, 580; London, 484; growing, 725, 790, 806; profits of ditto, 646, 678, 709, 723, 741; house for, 710; unproductiveness of, 499, 549; culture of, 516, 548, 836; Van Mons-Leon le Clerc, 723; to plant, 740; origin, &c., of, 756, 772, 789; list of, 783; to prune, 628; sale of, 840
Peas, harvest of in 1853, 27; manure for, 93; Page's Prodigy, 320, 341; returns respecting the state of, 506; boiling, 557; winter, 645; chick, 694; Dan O'Rourke, 774
Peat charcoal, a deodoriser, 393, 395; Professor Way on, 395, 503; lime burned by, 795
Pelargoniums, fancy, 7, 119, 304; propagation of do., 791; tricolor, 53; scarlet, 303; culture of, 487, 551; unique, 535
Perilla nankinensis, 774
Perry, to make, 669
Persia, expedition to, 837
Peruvian Barley, 588
Peruvian guano, 105, 106, 108, 730; experiments with, 13
Pescatorea, 236
Phelipæa, 405
Philesia buxifolia, 485
Phillips' Guide to Geology, rev., 54
Phillips' Guide to the Crystal Palace, rev., 615
Phœnocoma proliferum, 710
Phrynium micans, 647
Physiology, vegetable, Prof. De Vriese on, 549, 564, 597, 612, 645, 693
Pigeons, Arabian, 108, 189; Eaton on, rev., 226
Pigeons' dung as manure, 40
Pigs, to breed, 12; to feed, 348; Bean straw as food for, 795; breeding and management of, 410, 426, 443, 523, 618; killed by eating Monkshood, 474; at the Agricultural Society's Meeting, 477, 492; ages of, 330, 348, 379; Simonds on ditto, rev., 588; and box feeding, 700
Pinckneya ionantha, 663
Pine-apple, fibre, 340; Bacaxi, 612
Pink, the, 219, 240; to propagate, 823
Pinus, Royleana, 55; Bourcieri, 535; Laricio, wood of, 163; Pinaster, to sow in sand, 632; var. maritima, 133
Pinuses, effects of the winter on, 101; hardiness of, 237, 579
Pitcairnia nubigena, 55; echinata, 694
Pits, dung, Cucumber, 198; to protect, 645, 664, 693, 744, 773; mode of making straw coverings for, 791
Pittosporum crassifolium, 271
Plants, food of, 3, 11, 19, 22; new, 7, 23, 55. 71, 87, 103, 119, 135, 151, 167, 183, 219, 239, 255, 271, 287, 303, 323, 359, 439, 455, 471, 487, 502, 519, 535, 551, 566, 582, 599, 615, 631, 647, 663, 679, 694, 727, 741, 756, 772, 805, 836; importance of air to, 19; naming, 38, 533; new British, 53, 614; new mode of striking, 84, 131; packages of, and railways, 117, 612; collodionised cuttings of, 84, 131, 166, 254; potting, 134; buyers of, caution to, 150; supports for, to fix, 149; new arrangement of, 182; white, 200, 582; for the Crystal Palace, 236; in Wardian cases, 251; of Scripture, 254; sale of, at Ealing Park, 271; hurt by frost, 267, 285, 286, 287, 301, 302. 320, 329, 340, 341, 342, 358, 373, 389, 614; diseases of (see Pathology); economic, 306; medicinal, 306; effect of low temperature on, 320; viviparous, 389; effects of water on, 405; Sikkim Himalayan, 102, 320, 357; new work on ditto, 468; watering, 501 to kill aphides on bedded, 517; aquatic, 518; rice paper, 533; moon, 534; New Holland, to

propagate, 582; collector of, in the Crimea, 581; hardiness of, 595, 644, 691, 694, 710, 725, 726; syringing time for, 599; influence of solar radiations on vital powers of, 660; sea, coloured glass for, 661; packing, 680; sale of rare, 692, 712; curious formation of ice on, 739; long Latin descriptions of, 804; American, 391, 839; Waterer's catalogue of ditto, 839; vinegar, 840
Plant frames, protections for, 645, 664, 693, 744, 773
Plant-houses, to ventilate, 38, 53, 69
Plant sticks, to preserve, 485
Plantain paper, 218, 340, 342
Plantations and woods, 69, 70, 86, 118, 500, 580; young, 182
Planting, in tree trunks, 4; advantage of draining woodlands before, 23; woods, 70; young fences, 123, 171; Oaks, 133, 286; Ranunculuses, 151, 727; a four acre piece of land, 557; Tulips, 647, 727; Pear trees, 740; Vines in brick boxes, 757; Asparagus, 760
Platometer, Sang's, 106, 108
Plough, draining, 13; *v.* spade, 53, 67, 86, 457
Ploughing, steam, 412
Plums, in pots, 552
Poinsettia pulcherrima, 196
Polyanthus, 87; in pots, 136; culture of, 616
Ponds, frozen fish, 38; weeds in, 550
Pontey (Mr.), death of, 708
Poor, relief for, 70, 100
Poor Law Bill, 170
Pork, to cure, 223; American, 586
Porter, to make, 701
Portugal, Forrester's Essay on, rev., 343; Vine disease in, 358
Potatoes, from seed *v.* the disease, 52, 86; Cuthill's Essay on, rev., 61: culture of, 92, 795; deep soiling *v.* disease, 101, 166, 198; how to grow sound, 285; autumn planting, 360; to store, 389; and spring frosts, 390, 405; in Ireland, 438, 508, 700; substitutes for, 452: large produce of, 471, 630; returns respecting the state of, 506; Fluke, 533, 550, 710, 806; seed of, to sow, 600; kiln dried, 613; to protect from disease, 645; longevity of, 675; from cuttings, 254, 694; sorts in Sussex, 726; early Cruffe. 806
Potato disease, 180, 213, 341, 435. 566; Berkeley's pamphlet on, 213; preventive of, 290; sulphur a cure for, 302; in Scotland, 453, 470; at Bath, 501; in Wales, 502, 517; in Ireland, 508; at Maldon, 485, 533; and manure, 549; Mactaggart's pamphlet on, 675
Potato sets, autumn dried, 133, 149
Potato Yam, 467, 486, 820
Pots, garden, 7; Pansies in, 135; Polyanthuses in, 136; shallowness of, 134; culture of Verbenas in, 519; fruit trees in, 551; Plums in, 552; Vines for, 568
Potting, Carnations, 71; plants, 134; cuttings, 421
Poultry, 76, 108, 173, 245, 261, 293, 364, 396, 429, 445, 589; Doyle on Domestic, rev., 364; Tegetmeier's pamphlet on, 556; management of, 557; book, 637; diseases, 716; Moubray's by Meall, rev., 717; quantity sold in the London markets, 717; prizes for, at the Agricultural Society's meeting, 108; awards of ditto, 478, 493; Fowls, Cochin China, 61; Spanish 76; Ptarmigan, 156; Ceylon, 440; Dorking, 522; Bramah Pootra, 733; Pigeons, Arabian, 108, 189; dung, as manure, 40; Shows, Birmingham, 13, 795, 811, 846; Metropolitan, 28; Liverpool, 45; Batto, 396; fatting, 829
Prangos pabularia, 604
Preserving fruit, 600; fresh meat, 685
Primroses, Chinese, 167, 743; double, 664
Protection, materials for, 645, 664, 693, 744, 773, 822; mode of making straw, 791
Pruning, time for, 272; Vines, 469, 501, 565; standard Roses, 583; Pears, 628
Psammisia penduliflora, 167
Pulmonaria angustifolia, 254
Pultenæas, 597
Pyrola rotundifolia, 120

Q.

Quercus rotundifolia, 487; rigida, 502; hardiness of, 691

R.

Rabbits, 421
Radiation, 724, 742
Radishes, 181; at Constantinople, 134
Radnor's (Lord) estate, 185
Railways, and plant packages, 117
Railway wells in France, 790; Boydell's endless, 842
Railway traffic act, 612
Rain, at Birmingham in 1853, 6; at Dorset, 22, 38; at Herts, 38; at Ross, 53; at Witham, 53; Dumfriesshire, 70; in Devon, 133; guages, 214, 252, 269, 341, 365, 421, 438, 598; ditto and hygrometers, 372; to measure, 712
Rain-water, ammonia and nitric acid in, 778
Ranunculus, treatment of, 87, 104, 404, 791; to plant, 151, 727; choice of, 711
Rapecake, for cattle, 634, 651, 747
Raspberry, to force, 805
Rats, to kill, 520
Reaping, intervals between sowing and, 461; machines, 245, 413, 570, 617, 682, 825; ditto Patents, rev., 124; cost of machine, 601, 636
Reichenbach's Xenia Orchidacea, rev., 822
Rendle's Price Current, 69; rev., 23
Retinospora, 456
Revalenta arabica, 632
Rheumatism, cure for, 710
Rhododendrons, Sikkim, 102, 320, 357; anthopogon, 182; seeds, 200; at Regent's Park, 391; grafting, 552, 758, 821; hybrid, 725; hardiness of, 691, 837
Rhodoleia, hardiness of, 485
Rhynchites Betuleti, 101
Rice, as food, 28, 139
Rice paper plant, 533
Rick yards, covered, 60, 76, 123
Rifles, 456
Rivers' Orchard House and Rose Amateur's Guide, rev., 359; Miniature Fruit Garden, rev., 775
Road reform, 604
Robin on parasites, rev., 183

Wilkinson's Ancient Egyptians, rev., 6
Willow, Kilmarnock weeping, 392
Wilson's (Prof.) report of the New York Industrial Exhibition, rev., 605
Wind register, 6
Wines, New South Wales, 238; Australian, 755
Wingate (Mr.), death of, 653
Winter, Gulf Stream and mild, 42, 123; effects of, 101, 253, 302, 358, 373, 595, 614, 644, 691, 694, 725, 726; ditto, on Conifers, 286, 469, 579; at Biddulph Grange, 340; in Westmoreland, 573; at Bagshot, 358; in Cheshire, 373; in Notts, 373; in Shropshire, 373; in Devon, 389, 437; in Derbyshire, 390; in Lancashire, 405; in Surrey, 437; at Bicton, 437, 501; Verbenas to, 551, 567; Carnations to, 599, 760; Oats, for feed, 636; Peas, 645; Anterrhinums to, 710; in Cornwall, 710; Dahlia roots to, 743; in the Crimea, 755, 771, 803
Wire, galvanised, 519; ill effects of ditto, 104, 470, 501
Wireworm, 141
Wollaston's Insecta Maderensia, rev., 742
Wood, how to make look old, 70; Deodar, 20, 53, 115, 118, 149, 164, 181, 237; Cedar of Lebanon, 116, 118; ancient Cedar, 148, 164, 182, 214; of Cupressus torulosa, 164; of Pinus Laricio, 163; of Abies Douglasi, 163, 237; coniferous, 181, 198; paper, 238, 456; ditto made from soft, 179; to keep fungi off, 515; preservation of, 378, 410, 515
Woodlands, draining, 23
Woods and Forests, 38, 51, 71, 83, 168, 184, 196, 237, 283, 300, 302, 318, 319, 324, 348, 371, 403, 405, 407, 421, 435, 436, 437, 438, 470, 483, 501, 549, 579, 627, 659, 709, 835; Mr. Brown's appointment to, 132; Billington's pamphlet on, 195
Woods and plantations, 69, 70, 86, 118, 182, 500, 580
Woodward's History of Wales, rev., 330
Wool, prizes for, at the agricultural meeting, 108; British, &c., 305
Works, veterinary, 557; of agricultural instruction, 574
Worms, to kill, 56

Y.

Yams, Chinese, as food, 467, 486, 820
Yards, cool, for summer feeding, 378; covered, 540
Yew, poisonous, 389, 405
Yorkshire, crops in, 411, 572; East, notes from, 763
Yucca gloriosa, 501

Zinc labels, ink for, 824
Zingiberaceæ, structure of, 198

LIST OF WOODCUTS IN THE PRESENT VOLUME.

A.

Abies Kæmpferi, cone of, 455
Aeration, diagrams illustrative of, 357, 485
Ailanthus, adventitious buds of, 208
Anbury, illustrations of, 538, 555
Aquilegia californica, 835
Arbour, 630

B.

Brick Arnott stoves, 680

C.

Cattleya, monstrous, 804
Celery leaf, production of roots by a, 132
Cholera fly, 596
Cladophora, zoospore of, 68
Coal pug, 822
Cock-roach parasite, 533
Cotton mite, 319
Crocus bulbs and roots, 164
Cucumber pit, 198
Cynoglossum, cells from embryo of, 100

E.

Erysiphe Graminis, 425
Eugenia Ugni, 644

F.

Finger and toe in root crops, 538, 555
Foxglove, sections of monstrous carpels of, 800
Fruit tree protections, 389, 696
Fuel, plan of making cheap, 822
Fungi, soot, 547

G.

Grafting, illustrations of impositions in, 4
Grape disease, illustrations of, 419, 676
Gynerium argenteum, 708

H.

Heating, Arnott stoves for, 680; plan of making cheap fuel for, 822
Hendersonia polycystis, spores of, 100
Hydrodictyon utriculatum, 68

I.

Ice, curious formation of, on plants, 740
Insects, Birch and Vine weevil, 101; Cotton mite, 319; cock-roach parasite, 533; cholera fly, 596; steropus madidus, 613; American Oak-gall sphinx, 757

J.

Juniperus drupacea, 455

K.

Kæmpferia, diagram of flower of, 198

L.

Lettuce leaf, pitcher on, 646

M.

Madder root, section of tip of, 301
Mouse-trap, 822

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—APPROACHING ELECTION.—Subscribers are earnestly requested to consider whether, by the laws of this Institution, they are not in conscience bound to give a preference to those candidates who for the greatest number of years have providently subscribed to the Funds from which they are now compelled to solicit relief.

GENUINE NEW SEEDS.

SUTTON AND SONS, SEED-GROWERS, Reading, Berks, *can supply all kinds of Agricultural and other Seeds genuine as grown, and true to their kinds.* The advantages of procuring *Seeds direct from the Growers* are obvious, especially in scarce seasons like the present.

NEW SEEDS FOR 1854.

SUTTON'S NEW CATALOGUE OF SEEDS is now ready, and will be sent post free on receipt of one penny stamp.

Address, JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

SEED POTATOES.—The importance of cultivating those sorts of Potatoes which, from their vigorous habit of growth and early maturity, are least subject to disease, has induced us for several years (ever since the first general development of the disease), to make many experiments as to the sorts most desirable, and the cultivation most suitable. Our New Seed List contains the names and prices of the principal kinds, and will be sent post free on receipt of one penny stamp.—Address, JOHN SUTTON & SONS, Seed Growers, Reading Berks.

YORK NURSERIES.

JAMES BACKHOUSE AND SON respectfully inform their Friends, that notwithstanding the scarcity of many kinds of Horticultural Seeds this season, their own crops have been safely harvested, and with very few exceptions are quite equal in quality to those of last season. *Being themselves Growers*, they are able to a large extent to insure the genuineness of the articles they supply.—January 7.

THE TRUE THIMBLE RASPBERRY.

JOHN A. WATSON (late THOMSON), FRUIT GROWER, begs to inform the public that he has a fine stock of the above o dispose of, which is by far the best that is sent to Covent Garden Market, at 10*s*. per 100. Pine Plants of all the best sorts, warranted clean and healthy from 1*s*. 6*d*. to 12*s*. each. Post Office orders payable at Brentford.—Ealing Lane, Ealing, Middlesex.

SUPERB DOUBLE HOLLYHOCKS.

WILLIAM CHATER has now ready a fine healthy stock of young plants of all the leading sorts. For price and description see General List, which also contains hints on their culture, with observations on the exhibition of Hollyhocks, &c. &c., and may be had by inclosing a postage stamp.

Saffron Walden Nursery, January 7.

HIMALAYA CEDAR.

MAULE AND SONS beg to intimate to Noblemen and Gentlemen engaged in Forest or Ornamental Planting that they still hold large supplies of this universally admired and fine timber tree, which they are sending out at the below quotations.

CEDRUS DEODARA, 1 year seedlings, 20*s*. per 100, 8*l*. per 1000
" " 2 years ... 25*s*. " 10*l*. "
" " *1 foot ... 5*l*. "
" " *1 to 2 feet ... 7*l*. 10*s*. "
" " *2 to 3 feet ... 42*s*. per doz., 15*l*. per 100
" " **3½ to 4 feet ... 60*s*. " 23*l*. "
" " **4 to 4½ ft., extra fine, for Avenues and single planting } 80*s*. " 30*l*. "

☞ Those marked * are grown in suitable sized pots; those marked ** may be had either in pots or from the open ground. Large supplies of Taxodiums, Cryptomerias, Pinus excelsa, Abies Smithiana, Cupressus Goveniana, Lambertiana, &c. &c., offered at such prices as will admit of their introduction into mixed forest and other plantations. Terms sent on application.

The Nurseries, Bristol, Jan. 7.

LIME TREES, 12 to 14 feet, 42*s*. per 100.—SPRUCE FIRS, 2 to 3 feet, 6*s*. per 100.—LAURUSTINUS, very fine, 30*s*. per 100.—Apply to BENJAMIN R. CANT, St. John's Street Nursery, Colchester.

FRUIT TREES, &c.—The following are very strong, and finely grown:—Dwarf-trained Moor Park Apricots, and other sorts, 42*s*. per doz.; Standard trained Peaches and Nectarines, 60*s*. to 80*s*. per dozen; Dwarf trained Green-gage Plums, 30*s*. per dozen; Prince Albert Rhubarb, strong to force, 6*s*. per dozen.

Berberis aquifolium and Berberis dulcis.—These beautiful shrubs are 1 to 2 feet high; 8*s*. per 100, 60*s*. per 1000.—Usual discount to the Trade.—JOHN JEYES, Nurseryman, Northampton.

THE FINEST BALSAMS IN EUROPE, in Six Classes; Seed saved by Mr. GLENNY from flowers three inches across: the six, 37 stamps; Mixed Seeds, 13 stamps, in Sealed Packets only, signed and sealed. The finest seeds that can be had procured to order, and all other choice Horticultural subjects.—420, Strand.

TO FARMERS.

IN ACCORDANCE with the wishes of Farmers, Millers, and others interested in the Corn Trade, an Edition of the AGRICULTURAL GAZETTE AND GARDENERS' CHRONICLE will be published every Monday Afternoon, in time for post. The Monday's Edition will, in addition to the usual markets, contain a full report of the Mark Lane, Smithfield, and Newgate Markets of the day.—May be ordered of any Newsagent. Price 6*d*.

CONTENTS OF

SUTTON'S COLLECTIONS OF GARDEN SEEDS.—In consequence of the numerous applications for the particulars of sorts and quantities contained in these Collections, Messrs. SUTTON presented a List in the third page of last week's *Chronicle*, being the "CONTENTS of the NUMBER ONE COLLECTION," which they have no doubt will be generally and highly approved.

Gardeners and others who may prefer making their own selection are recommended to apply for our GENERAL PRICED CATALOGUE, *which will be sent prepaid on receipt of one penny stamp.*

JOHN SUTTON & SONS, SEED GROWERS, Reading, Berks.

TO THE SEED TRADE.

ABRAHAM HARDY AND SON, SEED-GROWERS and SEEDSMEN, Maldon, Essex, beg respectfully to inform the Trade that their Wholesale Priced List of Vegetable and Flower Seeds for January 1854 may be had on application.

NURSERIES, SLEAFORD.

JOHN AND CHARLES SHARPE, SEED GROWERS and NURSERYMEN, beg to state that their Wholesale Priced List of Seeds and Nursery Stock is now ready, and may be had on application.

STANDISH AND NOBLE'S CATALOGUE for the present season is Now Ready, and may be had on application. A selection from it appeared as a detailed advertisement in the *Gardeners' Chronicle*, of Saturday, Sept. 10th, to which they respectfully refer plant buyers. It contains many new and choice plants.—The Nursery, Bagshot, Surrey, Jan. 7.

CAREY TYSO'S CATALOGUE OF FLORISTS' FLOWERS for 1853-4 may be had post free for two labels. TREATISE on the ANEMONE, for four labels. Ditto on RANUNCULUS, for eight labels.

	£.	*s*.	*d*.
RANUNCULUSES: 100 splendid named sorts, 40*s*. to	4	0	0
" 25 superb Seedlings, do.	1	15	0
" 100 fine mixtures from ... 8*s*. ...	1	0	0
DOUBLE ANEMONES: 50 fine named sorts 12*s*. ...	0	15	0
Ranunculus and Anemone Seeds, per paper ...	0	2	6

IMPORTED GERMAN SEEDS:—Asters, Stocks, Balsams, Larkspurs, Poppies, Zinnias, &c., in named assortments, 2*s*. 6*d*. each; 25 varieties of Annuals, 5*s*. The above articles can be sent by post.

C. TYSO'S Sovereign assortments, comprising 18 select Ranunculuses and 18 choice Double Anemones, sent postage free for 1*l*. 1*s*.—Wallingford, Berks.

DAHLIAS.

JOHN KEYNES, FLORIST, Salisbury, respectfully begs to announce that his Annual CATALOGUE of all the NEW and FIRST-RATE DAHLIAS for 1854 is now ready, and will be forwarded on application.

The two new and beautiful Dahlias, "FANNY KEYNES" and "RACHEL RAWLINS" will be figured in the February Number of "THE FLORIST;" and as drawings of these beautiful Dahlias cannot be procured through any other medium than "THE FLORIST," J. K. recommends his friends to order the February Number without delay.

Castle Street Nursery, Salisbury, Jan. 7.

AMERICAN PLANTS.

JOHN WATERER begs to announce that his NEW CATALOGUE of RHODODENDRONS, AZALEAS, CONIFEROUS PLANTS, &c., is now published, and may be had by enclosing two stamps for postage.

The colours of all the Rhododendrons worthy of cultivation are described in order to facilitate purchasers in making selections, together with a Treatise on their successful management.

☞ The Rhododendrons forming the American Exhibitions in the Royal Botanic Society's Garden, Regent's Park, London, are annually supplied from this establishment.

The American Nursery, Bagshot, Surrey, near the Farnborough Station, South-Western Railway, and 3 miles from Blackwater South-Eastern Railway.

GEORGE BAKER begs to say that his DESCRIPTIVE CATALOGUE of AMERICAN PLANTS, CONIFERS, ORNAMENTAL SHRUBS, FRUIT and FOREST TREES, &c., may be had by enclosing two postage stamps.

G. B. wishes to call particular attention to his fine Stock of GREEN and WEEPING HOLLIES, from 1 to 12 feet high.

G. B. has supplied the American Exhibition in the Royal Botanic Gardens, Regent's Park, from its commencement.

American Nursery, Windlesham, near Bagshot, Surrey, about six miles from Staines Station, Windsor Branch, South-Western Railway, where conveyances may be obtained.

GARDEN SEEDS AND IMPLEMENTS.—The Subscribers respectfully intimate that their PRICED CATALOGUE of VEGETABLE and FLOWER SEEDS, and GARDEN IMPLEMENTS, for 1854, is now published, and will be forwarded on application.

EDWARD SANG & SONS, Nurserymen and Seedsmen, Kirkcaldy.

AMERICAN PEACHES FOR CHRISTMAS.—This excellent fruit, perfectly fresh, and of the finest flavour, we are now importing from the United States, "hermetically sealed," in jars and cans. Those in jars, preserved in brandy, at the reduced price of 5*s*.; fresh Peaches, in cans, 4*s*.; spiced, 3*s*. They will be forwarded to all parts of the country on receipt of a Post-office order for the amount.—Sold, with every variety of American goods, at the American Warehouse, by ROGERS & Co., 546, New Oxford Street, London.

WAITE'S NEW EARLY PEA.

DANIEL O'ROURKE.—The earliest and best Pea in cultivation; a week earlier than the Emperor, longer pods, and a much better cropper; height 2½ to 3 feet. If this Pea does not give general satisfaction the money charged will be returned.

Trade price to be had on application to J. G. WAITE, Seed Merchant, 181, High Holborn, London.

JUDSON'S

RICHMOND VILLA BLACK HAMBURGH VINE.

ARTHUR HENDERSON AND CO. have the pleasure of informing their patrons and friends that they have good plants of this valuable and much-esteemed Vine at 5*s*. each; extra strong plants, 7*s*. each.

N.B.—For full particulars of the distinguishing characteristics of this Vine, we beg to refer our customers to the *Gardeners' Chronicle* of October 25th, 1851.

TROPÆOLUM AZUREUM ... 42*s*. per dozen.
" BRACHYSERAS ... 18*s*. "
" TRICOLORUM ... 24*s*. "

The above are very strong sound roots just commencing their growth, and might with safety be transmitted through the Post Office. Usual discount to the trade when ordered by the dozen.

HUGH LOW & Co., Clapton Nursery, London.—Jan. 7.

HUGH LOW AND CO. have the pleasure to announce to their Friends and the Public that they have now received the greater part of their Stock of Vegetable and Flower Seeds, selected with considerable care from the best growers. They would more particularly recommend their collections of German Flower Seeds, consisting of Stocks, Asters, Larkspurs, Balsams, Zinnias, &c., all which are of the best quality, and imported direct from Erfurth.—Clapton Nursery, London, January 7.

SUPERB NEW APPLE.

BRADLEY'S GOLDEN PEARMAIN.

RICHARD BRADLEY begs to inform Nurserymen and the Public generally, that he is again prepared to send out t his very excellent New Apple. Fine healthy plants at the follo wing reduced prices:—Dwarfs, 2*s*. 6*d*. each; Half Standards, 3*s*. e ach; Full Standards, 3*s*. 6*d*. each; with the usual discount to the t rade when three plants are ordered. For full particulars of its e xcellent qualities see *Gardeners' Chronicle* of October 9th, 16th, and 23d, 1852.—Halam Nursery, Southwell, Notts.

FARNHAM HERO CUCUMBER. — This is an hybrid from Essex Hero, an exc[illegible]t bearer; 12 fruit can be cut from it at one time, from 16 to 24 inches long, growing upright; and double that complement if pegged down. Four Seeds will be sent for 12 postage stamps.

JOHN HAYES, FLORIST, Farnham, Surrey.

SELECTED GARDEN SEEDS.—We beg to offer the following Collections of Garden Seeds:—

	£	*s*.	*d*.
No. 1.—A complete collection, suitable for a large garden	3	0	0
2.—A collection of equally choice varieties, but smaller quantities	1	10	0
3.—A collection suitable for a small garden ...	0	15	0

Nos. 1 and 2 collections will be sent carriage free to any Railway Station in England or Wales.

J. C. WHEELER & SONS, SEED MERCHANTS, Gloucester.

CHOICE SEEDS.

BASS AND BROWN'S SPRING CATALOGUE FOR 1854 is now in the Press. The Part containing the SEEDS can be forwarded immediately, on application, for two penny stamps.

PEAS, FINE NEW KINDS, of last and present year's introduction.

Fairbeard's Nonpareil, earlier than Champion of England, and fine rich flavour ... ... 5*s*. 0*d*. per quart.
Waite's Daniel O'Rourke, very early ... ... 2 6 "
Sangster's New No. 1, 2½ ft., very early, prolific and fine pods ... ... 2 0 "
Stuart's Paradise, 4ft., a very fine large long-podded marrow, three weeks before Thurstone's Reliance, or other Peas of the same character ... ... 2 0 "
Hairs' Defiance, 4 ft., a fine new wrinkled marrow 2 0 "

The three last mentioned were grown last season by ourselves, and we can recommend each as an acquisition. Sangster's No. 1 *and Stuart's Paradise will be included in the collections below.*

BASS AND BROWN'S ASSORTED COLLECTIONS OF VEGETABLE SEEDS, comprising the best in cultivation, including several new sorts of excellent quality.

	£	*s*.	*d*.
No. 1.—Collection for a large garden, containing 20 quarts Peas, in 20 best sorts, and all other vegetable seeds in proportion, for one year's supply...	3	0	0
No. 2.—Collection in smaller proportions	2	0	0
No. 3.—Collection do. do.	1	5	0
No. 4.—Collection of good kinds for a small garden ...	0	15	0

Copies of the Autumn Catalogues may still be had for three penny stamps.

Goods (not under 20*s*.) carriage free to all stations in London.

Seed and Horticultural Establishment, Sudbury, Suffolk.

SUTTON'S COMPLETE COLLECTIONS OF KITCHEN GARDEN SEEDS FOR ONE YEAR'S SUPPLY *contain all the best sorts of Vegetable Seeds for sowing, from January to December, to stock the garden throughout the year, with descriptions and instructions.*

	£	*s*.	*d*.
No. 1.—A complete Collection of Garden Seeds for one year's supply, including 20 quarts of the best Peas for succession, 10 quarts of Beans, and full quantities of French Beans, choice sorts of Broccoli, Cucumbers, Melons, Lettuces, Cauliflowers, and every other sort of Vegetable required, in full quantities ...	3	0	0
No. 2.—A complete Collection, in quantities proportionately reduced	2	0	0
No. 3.—A complete Collection, equally choice sorts ...	1	5	0
No. 4.—A small and very choice Assortment	0	15	0

If some kinds of Seeds are already possessed, purchasers are requested to name them, that increased quantities of others may be sent in lieu of them.

As some sorts are very short in crop this year, purchasers are respectfully recommended to send their orders early.

CARRIAGE FREE, from JOHN SUTTON & SONS, Seed Growers Reading, Berks.

CLARENDON NURSERIES, CAMBERWELL.

JOSEPH FRYER can supply every description of Fruit Trees, Ornamental Trees, Evergreen and Flowering Shrubs, Standard and Dwarf Roses, Greenhouse, Herbaceous, and Alpine Plants, Vegetable and Flower Seeds, Peat Mould, Loam, Manure, Silver Sand, Turf, Gravel, &c.

J. F. can supply the trade with a large quantity of Limes, Planes, Elms, Poplars, Scarlet Thorns, Mulberries, Evergreen Privet, green and variegated Euonymus, Laurels, Lilacs, Ivies, Evergreen Oaks, Rhododendrons, Magnolia grandiflora, Hardy Heaths, Garrya elliptica, Glycine sinensis, Althæa frutex, Bignonia radicans major, Clematis azurea grandiflora, Passion-flowers, Menispermum canadense, Salisburia adiantifolia, Gladiolus psittacinus, Tiger Lilies, &c.

COLE'S SUPERB CRYSTAL WHITE CELERY.

J. THORNLEY, W. COLE, AND CO., NURSERYMEN, SEEDSMEN, and FLORISTS, Withington, Manchester, beg to announce that they are now prepared to supply this fine Celery at 1s. 6d. per half-ounce packets, or in larger quantities. This variety has given universal satisfaction, and has been proved to possess all the good qualities attributed to it by W. Cole last season. It can also be procured from the following agents:—

Messrs. Hurst and M'Mullen, 6, Leadenhall Street; Messrs. Noble, Cooper, and Bolton, 152, Fleet Street; Messrs. Minier & Co., 60, Strand; Messrs. Charlwood & Cumming, Covent Garden; Mr. Turner, Slough; Mr. Duncan Hairs, St. Martin's Lane; Mr. Denyer, Gracechurch Street; Mr. J. Fairbairn, Clapham; Messrs. A. Henderson & Co., Pine Apple Place; Messrs. Downie and Laird, Edinburgh; Messrs. F. & J. Dickson, Chester; Messrs. F. & J. Dickson, Manchester; Messrs. J. & J. Fraser, Lea Bridge, Essex; Messrs. Little and Ballantyne, Carlisle; Messrs. Veitch & Son, Exeter; Mr. J. Veitch, Exotic Nursery, Chelsea; Mr. Clarke, King Street, Covent Garden; Messrs. Finney & Co., Gateshead; Mr. A. Pontey, Plymouth; Mr. E. Rendle, Plymouth; Mr. Cattell, Westerham, Kent; Mr. Smith, Riverhead, Kent; Mr. Epps, Ashford and Maidstone, Kent; Messrs. Lucombe, Pince, & Co., Exeter; Mr. Browne, Norwich.

All orders to be addressed as above, instead of to "Dartford" as heretofore.

SUBSTITUTE FOR GARDEN MATS.—Waxed Sheeting nearly 2 yards wide, 1s. per yard run—admits light, and excludes cold; Thick Canvas Tarpaulling, 1s. per square yard; Thick Canvas Waxed Sheeting, 1s. per square yard, may be had various widths: these Canvases are excellent for Roofing Sheds and Outhouses, as they are quite Waterproof.—R. RICHARDSON, 21, Tonbridge Place, Judd Street, New Road, London.

HORTICULTURAL BUILDINGS, ROCK AND RUSTIC WORK, ORNAMENTAL WATER, FOUNTAINS AND FALLS, AND LANDSCAPE GARDENING, executed on the best principles; Estates Improved, Land Laid Out for Building, &c., by Mr. GLENNY, Valuer, Estate and Horticultural Agent, 420, Strand.

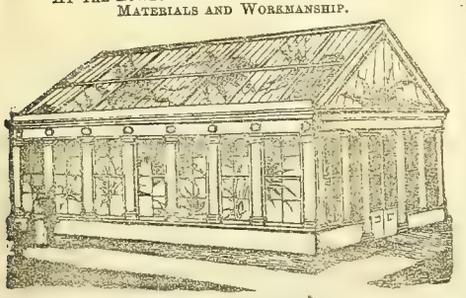
HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

EDWARD AND A. WEEKS (late with J. WEEKS & Co.), Park Cottage, King's Road, Chelsea, are now in a position to execute any of the above works, in the very best manner, and at a reduced price. Materials and workmanship warranted best quality. Plans and estimates forwarded on application for all kinds of Horticultural Erections, also for the Heating of Churches, Hospitals, Halls, Offices, &c.

One, two, and three-light Boxes always on hand.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1s. 3d. per foot super., which are superior to all others for price with quality, and if known would supersede all others. A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8d. per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

GLASS.

THOMAS MILLINGTON, Importer of Foreign Sheet Glass, requests attention to the present Prices of Glass and Stock sizes, which are cheaper and better than those of English manufacture:—

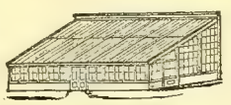
T. MILLINGTON, 87, Bishopsgate Street Without, London.

HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.



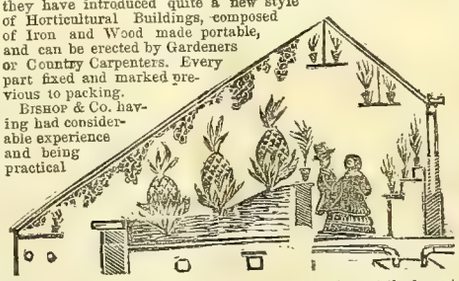
The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

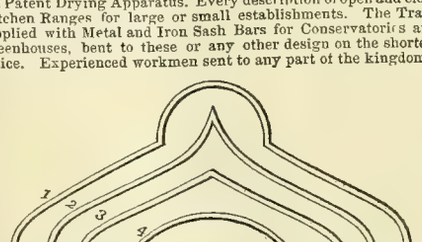
BISHOP AND Co., City Road (near the Toll Gate), London, beg to announce to the Nobility and Gentry that they have introduced quite a new style of Horticultural Buildings, composed of Iron and Wood made portable, and can be erected by Gardeners or Country Carpenters. Every part fixed and marked previous to packing.



BISHOP & Co. having had considerable experience and being practical working men, are now prepared to execute orders at the lowest possible price consistent with their style of workmanship, which can be well recommended. Heating by Hot Water or Air on the most improved and scientific principles. Manufacturers of Photographic Houses, and the Portable Model Cottage suitable for Gardeners or Emigrants. Plans and Estimates forwarded on application to BISHOP & Co., City Road, London.

METAL CONSERVATORIES, PLAIN OR ORNAMENTAL, ERECTED TO ANY DESIGN.

THOS. WALLER AND CO. (many years Foreman to Messrs. Deane, Dray, & Deane, Finsbury Iron Works, and London Bridge), Iron Founders, House and Ship Smiths, Gas Fitters, and Manufacturers of all kinds of Metal Conservatories, Greenhouses, Verandahs, Balconies, Summer-houses; Hot, Cold, Shower, and Fumigating Baths; Public and Private Buildings. Greenhouse Conservatories heated by hot water or the Patent Drying Apparatus. Every description of open and close Kitchen Ranges for large or small establishments. The Trade supplied with Metal and Iron Sash Bars for Conservatories and Greenhouses, bent to these or any other design on the shortest notice. Experienced workmen sent to any part of the kingdom



Office, 47, Fish Street Hill, London.

Ratcliff Iron Works, 12 and 13, Rose Road, Ratcliff, near Stepney Railway Station.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, ETC.

JAMES PHILLIPS AND Co. have the pleasure to hand their present prices of Glass for Cash:—

PATENT ROUGH PLATE, THICK CROWN GLASS, and PATENT PLATE GLASS for Horticultural purposes, at reduced prices, by the 100 square feet.

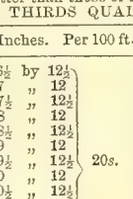
GLASS TILES AND SLATES made to any size or pattern, either in sheet or Rough Plate Glass.

Propagating Glasses, Beehive Glasses, Cucumber Tubes, Glass Milk Pans, Glass Water Pipes, and various other articles not hitherto manufactured in Glass.

PATENT PLATE GLASS.—The present extremely moderate price of this superior article should cause it to supersede all other inferior window glass in a gentleman's residence. No alteration connected with the sash is required.

GLASS SHADES, as ornamental to, and for the preservation of every description of goods susceptible of injury by exposure. Prices, since the removal of the excise duty, reduced one-half. List of Prices and Estimates forwarded on application to JAMES HETLEY & Co., 35, Soho Square, London.

TO AMATEUR GARDENERS, LOCAL BOARDS OF HEALTH, & SANITARY WORKS.



PATENT GLASS TUBES, Iron Coated with Glass, Gutta Percha, Combinated ditto, Patent Flexible India Rubber Tubing, and every other Hose for Watering Gardens. The Hydraulic Ram, Fire, Garden, and every other kind of Pump, Sluice Cocks, Hydrants, High Pressure Cocks, and all other articles to be had, Wholesale and Retail, of

FREEMAN ROE,
HYDRAULIC ENGINEER,
70, Strand, and Bridgefield, Wandsworth.

CUCUMBER AND MELON BOXES AND LIGHTS.—One hundred 1, 2, and 3-light Boxes and Lights of all sizes, ready for immediate use. Warranted best materials, packed and sent to all parts of the kingdom; 2-light Boxes and Lights from 1l. 6s. Garden Lights of every description, Conservatories, Green and Hothouses made and fixed in all parts of the kingdom. References given to the nobility, gentry, and the trade, in most of the counties in England.—JAMES WATTS, Hothouse Builder, Claremont Place, Old Kent Road, London.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application.

MAW'S ENCAUSTIC TILE PAVEMENTS.

MAW & CO. send for six stamps their NEW BOOK OF DESIGNS (with prices), adapting this most durable, economical, and decorative production of Mediæval Art to Entrance Halls, Passages, Conservatories, Verandahs, and every description of modern and ancient Building. Specimens at 11, Aldersgate Street, City.

Benthall Works, near Broseley, Shropshire.

WIRE FENCING, 6¾d. per square yard, in various widths, from 6 feet to 15 inches, an effectual fence against hares, rabbits, cats, dogs, sheep, deer, fowls, pheasants, &c. Wire Hurdles 3s. each (5 ft. 6 in. by 2 ft. 3 in). This Wire-work is worked in oil, and does not rust very quick, and is the cheapest article of the kind in the market.—R. RICHARDSON, 21, Tonbridge Place, New Road, near King's Cross, London.

PEAS! PEAS! THE BEST VARIETY IN CULTIVATION.

CHAMPION OF ENGLAND, a blue wrinkled Pea, very productive, of quick growth, and of a most delicious flavour. This extraordinary Pea combines in one the merits of all others, and has none of their demerits; for, although a wrinkled Pea, it is both hardy and early, and being of quick growth, it is the best kind to plant throughout the season for each crop. It is highly productive, bearing very long pods of a lively green, which are well filled, and the Peas are generally as large as small horse Beans, of a deep green colour, and beyond all others of a most delicious flavour. Height, 3 ft. to 3½ ft.

Price, in quantities of not less than 1 peck ... Bag included 6*s*.
" " ,, 1 bushel ... ... " 16*s*.
" " ,, 1 sack (4 bushels) " 60*s*.
" " ,, 8 bushels (1 qr.) " 106*s*.
Delivered, freight paid by Railway to London.

Orders, with remittance or satisfactory reference, will have immediate attention on application to

H. AND A. WALLIS, SEEDSMEN, Ipswich.

TO NOBLEMEN, GENTLEMEN, AND COMPANIES PLANTING.

THOMAS JACKSON AND SON respectfully invite an inspection of their extensive and fine collection of ORNAMENTAL SHRUBS and TREES; they are of fine growth, and in excellent condition for planting for immediate effect. To the undernamed T. J. & SON especially desire attention. Prices may be obtained by letter or personal application.

American Arbor-vitæ, 2 to 10 ft.
Chinese do., 2 to 8 feet, fine
Arbutus, 2 to 5 feet
Aucubas, 2 to 4 feet, very bushy
Cedar, Deodar, 2 to 12 feet, fine
Cedar of Lebanon, 2 to 9 ft., fine
Variegated Hollies, 2 to 9 feet
Green do., 2 to 9 feet
Weeping do., 5 feet stems, fine
Berberis aquifolium, 2 to 3 feet, bushy
Taxodium sempervirens, 3 to 12 feet, fine
English Yews, 2 to 9 feet
Irish do., 2 to 8 feet, very fine
Tree Box, 2 to 7 feet
Araucaria imbricata, 1 to 5 feet, fine
Deutzia gracilis, 1 to 2 feet, fine
Pinus excelsa, 3 to 8 feet, fine
Pinus insignis, 3 to 5 feet
Cryptomeria japonica, 2 to 6 ft.
Taxus pyramidalis, 2 to 6 feet, fine
Laurustinus, 1 to 3 feet, very bushy
Evergreen Oaks, 2 to 7 feet, fine
Portugal Laurels, 2 to 5 feet
Magnolia acuminata, 4 to 10 ft.
Do. grandiflora Exmouth, 2 to 5 feet, fine
Tree Peonies, 1 to 3 ft., bushy
Chinese Junipers, 2 to 8 ft., fine
Upright Cypress, 5 to 8 ft., fine
Forsythia viridissima, 2 to 4 ft.
Red Cedars, 3 to 5 feet, fine

T. J. & SON having added to their previously good stock of American Plants, about one-third of the entire stock of the Norbiton Nursery, so long famed for its collections of Hybrid Rhododendrons, Azaleas, &c., can now offer on most advantageous terms—

Rhododendron ponticum, 1 to 5 ft., in great variety.
Do. aureum, and the varieties of yellows, 1 to 7 ft.
Do. Smithi, tigrinum, and other scarlets, 1 to 9 ft.
Do. campanulatum and light varieties, 1 to 7 ft.
Azaleas, Indian, American, and Ghent varieties, 1 to 6 ft.
Kalmia latifolia, and others, 1 to 4 ft.

T. J. & SON have a splendid healthy stock of the Sikkim Rhododendrons, of which they will furnish the 12 following fine kinds, in pots, for 63*s*., viz., Thompsoni, fulgens, glaucum, glaucum nanum, niveum, Falconeri, ciliatum, Edgeworthii, lancifolium, cinnabarinum, ferruginosum, and calycatum.

Fine Fruit and Forest Trees; strong Quick for Fences, and all other kinds of Nursery Stock.—Nurseries, Kingston, near London

KILMARNOCK WEEPING WILLOW, OR SALIX CAPREA PENDULA.—The Trustee on the sequestrated estate of Thomas Lang, Nurseryman, Kilmarnock, intimates that he is now ready to supply plants of this beautiful new Willow. Mr. Lang has received numerous testimonials as to its being a new, distinct, and interesting addition to our Ornamental Trees, from Professor Lindley, of London, Mr. MacNab, Royal Botanic Gardens, Edinburgh, and others; but the following letter from Sir William Jackson Hooker, Director of the Royal Gardens, Kew, is of itself sufficient both as a description and a recommendation of the plant.

"Royal Gardens, Kew, Sept. 29, 1853.

"Sir,—The Salix caprea pendula, or Kilmarnock Weeping Willow, is doing well with us, and is much admired for its decidedly weeping character. It bears the same relation to the ordinary Salix caprea that the Weeping Ash does to the Common Ash, and I need say nothing more in its favour. Every branch is gracefully curved downwards, and the great breadth of the foliage and its dark colour give it a totally different character from the common Weeping Willow, Salix Babylonica. I think very highly of it as an ornamental small tree.

"I am, &c. (signed) W. J. HOOKER."

Prices.—Furnished Plants, on own roots, trained to one stem, 2*s*. 6*d*. each.; do. do. extra fine, 3*s*. 6*d*. each; a few plants, grafted on tall stems, 5*s*. each.

☞ Plants will be delivered in London for 6*d*. each additional, and despatched from thence to any address.

Orders to be addressed to Mr. JOHN DICKIE, Seedsman, Kilmarnock, the Trustee, who will also forward, on application, a printed list of the General Nursery Stock, which is now being sold off at extremely low prices. The Trade supplied on favourable terms.

SEED ESTABLISHMENT AT 102, EASTGATE STREET, AND NURSERY GROUNDS AT NEWTON, NEAR CHESTER.

THE FIRM OF F. AND J. DICKSON having been DISSOLVED, I take the liberty of informing my Friends and the Public generally, that I purpose in future carrying on business in conjunction with my Sons, under the Firm of "JAMES DICKSON & SONS," and beg very respectfully to solicit a share of those kind favours hitherto conferred on my late partner and myself, and which will at all times continue to have my utmost care and undivided attention. I avail myself of this opportunity of returning to all the numerous customers and friends of the late Firm throughout the entire principality of North and South Wales, Cheshire, Shropshire, Lancashire, and adjoining counties, my most sincere thanks for the very liberal support and great kindness which for thirty-five years I have had the pleasure and satisfaction of experiencing whilst personally travelling through these districts. Trusting to be favoured with a continuance of the same support and commands, I am yours, very respectfully,

JAMES DICKSON.

J. D. & SONS, holding a very heavy Stock of Forest, Fruit, and Ornamental Trees, Evergreen and Flowering Shrubs, and all kinds of Nursery Stock, on Grounds which must be cleared before the end of March next, have determined, rather than incur the additional expense of transferring them to other parts of their Grounds, to Dispose of the Stock thus situated at the lowest possible prices.

Their New Seed Warehouse, which is at 102, Eastgate Street, four doors from the south end of St. Werburgh Street end, towards the Cross, is fully supplied with a newly-selected Stock of all sorts of Garden, Farm, Flower, and other Seeds, of the very best quality, for the ensuing season, orders for which will much oblige.

☞ J. D. & SONS beg to add, that the old-established Seed Business (heretofore carried on by the late firm) at 106, Deansgate, Manchester, has become their property, by which means they will be enabled to supply their friends in that city and neighbourhood with every article in the several branches of their business with every facility and despatch.

☞ J. D. & SONS would further state, that they will retain and continue, on a greatly enlarged scale, the Nursery and Seed Establishment carried on by the late firm at Newtown, Montgomeryshire, from which place also they will have great pleasure and satisfaction in supplying their friends in that locality with such orders as they may favour them with

THE CUCUMBER SEASON.—Growers of this superb and select branch of Horticulture should endeavour to procure seeds of such varieties as will give them satisfaction, and meet every expectation for exhibition or otherwise. The under-mentioned have been thoroughly proved, and testimonials and orders again received from numerous correspondents.

CAPTIVATION CUCUMBER, a beautiful black spine, free from ribs and shrivels, carries its bloom well, fruit never turning colour at the point like many others, length from 20 to 28 inches, uniform from stem to point (a consideration to exhibitors), 2*s*. 6*d*. per packet.

PHENOMENON CUCUMBER.—Also a fine black spine, rapid grower, and the hardiest of all long Cucumbers, in other respects similar to the above, 2*s*. 6*d*. per packet. This will give every satisfaction to growers.

Victory of Bath Cucumber, 1*s*. per packet; Winter Cucumber, Lord Keynon's Favourite, 2*s*. 6*d*. ditto; Gordon White Spine, 1*s*. ditto; Chamberlain's Essex Hero (very fine), 2*s*. ditto; Sunderlandwick Cucumber (very fine), 2*s*. ditto; Hunter's Prolific, 1*s*. ditto; and numerous other good varieties, at 1*s*. per packet.

MELONS, the best sorts, true to name, and such as will give every satisfaction.—Tiley's Incomparable, 1*s*. 6*d*. per packet; Tiley's Bromham Hall, 1*s*.; Tiley's Golden Ball, 1*s*.; Tiley's Queen, 1*s*.; Tiley's Bowood, 1*s*.; Victory of Bath, 1*s*.; Camerton Court, 1*s*.; Beechwood, 1*s*.; Windsor Prize, 1*s*.; Emperor, 1*s*.; Fleming's Hybrid Persian, 1*s*.; Hampton Court, 1*s*.; Blackhall's Green Flesh, 1*s*.; Bailey's, 1*s*.; and numerous others.

*** A Packet of each of the first-named Cucumbers, and two packets of either of the Melons named, sent free for 60 penny stamps.

HOLLYHOCK SEED, saved from a splendid collection of all the newest and best varieties out, 2*s*. 6*d*. per packet.

GERMAN ASTER SEED, from some of the finest flowers ever exhibited, 1*s*. per packet, or a packet of this and of the Hollyhock for 3*s*.

ANTIRRHINUM SEED (SPLENDID), 1*s*. per packet.

A remittance must accompany every order by cash or penny postage stamps, when the whole or any part (as the case may be) will be immediately forwarded.

EDWARD TILEY, NURSERYMAN, SEEDSMAN, & FLORIST,
14, Abbey Churchyard, Bath, Somersetshire.

SUPERB LATE WHITE BROCCOLI—"EMPEROR."

EDMUND PHILIP DIXON having purchased the entire stock of the above Broccoli of Messrs. Elletson, Market Gardeners, Thorngumbald, near Hull, begs to announce that after the 1st of January next he will be prepared to send it out in sealed packets at 2*s*. 6*d*. each. This Broccoli has been raised by the Messrs. Elletsons, the raisers of the Mammoth, sent out some time ago, who state that the EMPEROR, if sown at the same time, will come into use before it. Is of very dwarf growth, perfectly hardy, with heads from 15 lbs. to 20 lbs. weight; keeps its colour, and stands firm three weeks after it is ready to cut. A noble flower and commands the best price of any other in the Hull market, where it is well known, and will be a great acquisition to the market gardeners around London, as well as those who wish for a first-rate Broccoli.

May be had of Messrs. NOBLE, COOPER, & BOLTON, 152, Fleet Street; and Messrs. HURST & M'MULLEN, 6, Leadenhall Street London. Also of the Advertiser, 57, Queen Street, Hull.

GOOD SEEDS.

HOME GROWN SEEDS, NEW AND TRUE, CARRIAGE FREE.—The great advantages of purchasing SEEDS OF THE GROWERS are the *superior germinating quality, trueness of the sorts, and economy of price.* These advantages have now been afforded by us to *retail* purchasers for several years, and are fully appreciated by the public, as is shown by the numerous recommendations we are receiving from our customers in all parts of the Kingdom.

Our New Seeds are all arranged for delivery, and we respectfully solicit early orders, which will have the preference of scarce sorts.

Prices and other particulars may be had on remitting one postage stamp.—Address, JOHN SUTTON & SONS, SEED GROWERS, Reading, Berks.

The Gardeners' Chronicle.

THOUGH it is quite true that practice will often effect much without theory, it is no less true that theory fairly deduced from correct and sufficient data is the best handmaid of practice. False theories, on the contrary, especially when supported, whether justly or not, by the authority of widely extended reputation, are great impediments to the progress of science and production of serious loss to those who implicitly trust in them. The theory first broached by INGENHOUSZ, and afterwards supported by SENEBIER, SAUSSURE, and LIEBIG, of the nutriment of plants from the carbonic acid contained in the air, is evidently one of great importance as regards the growth of vegetables, and more especially when combined with views like those of LIEBIG and SCHLEIDEN respecting the action of manures. If the organic matters contained in manure are unimportant, and an opinion to this effect prevails, the practice of agriculture, whether beneficially or not, will evidently be materially modified. Suppose, for instance, gypsum be used to any great extent with a view to fix the ammonia of animal manure, the consequences may be highly injurious in the cultivation of Beans and other pulse. For though the effect on green crops, such as Clover, is the production of a luxuriant vegetation, where the oxalic acid contained in the green leaves and stem combines with the lime of the gypsum, for which it has a great affinity, thus setting the sulphur free; yet if the crop be one of Peas or Beans, where the object is to obtain as large a produce of seed as possible, on the production of which it has no beneficial influence, the inevitable consequence will be a vast quantity of haulm, to the greater or less diminution of the ultimate harvest. On the other hand, where little or no oxalic acid enters into the composition of the object of cultivation, as in cereals, the gypsum will be inoperative. From such considerations and from the loss experienced in the use of some of the patent manures, depending for their composition on the theories of LIEBIG, Dr. SCHULTZ-SCHULTZENSTEIN has devoted much attention to the subject, and has laid some very sensible observations before the Prussian Horticultural Union relative to the theory of nourishment from the air, but more especially to the part which water performs in the process of vegetation, at the same time combating the notion of the nitrogen of plants being derived from the small quantity of carbonate of ammonia contained in rain-water, or that the principal object in manures is to supply nitrogen in that form in which he maintains that it is never assimilated by plants. He contends, on the contrary, that nutriment is conveyed to plants by humates and their allies, derived from various sources, whether as mere extract or in the form of geic and crenic acids dissolved in water, and that these are the only source of the oxygen which is given out by plants under the influence of light. Humus and humates contain all such elements as are in general necessary for vegetation, as carbon, hydrogen, nitrogen, oxygen and even sulphur and phosphorus, while minera salts merely act as stimulants, or by way modification.

The beneficial effect of irrigation on crops canno be denied; the question is, from whence is this benefit derived, whether from organic or other matter dissolved in the water, or from the mere constituents of the water and the carbonate of ammonia which it may contain? Now, however true it may be that LIEBIG found certain waters deficient in organic matter, Dr. SCHULTZ shows clearly, from a multitude of instances, that such matters do exist in those waters which are in general used for irrigation, even in those which are nearly limpid, and that to a degree sufficient for the requirements of vegetation.

It is contended, however, that the products of vegetation are simply hydrated carbons, into which the elements of water enter in the same proportions in which they form water. But if so, the ultimate proportions of hydrogen and oxygen must be the same in both cases. Now, if it be assumed that this is the case in sugar and lignose, a multitude of instances may be given in which no such proportion is observed, but in which there is every possible variation, whether of excess of oxygen or hydrogen, or as in oil of lemons, which consists of 86.89 C; 12.32 H; deficiency of oxygen.

Again, BERTHOLLET conceived that the hydrogen was assimilated, and that the oxygen was set free. This has been completely disproved by SAUSSURE, who showed that plants do not increase by assimilation of water. LIEBIG, however, in ignorance probably of SAUSSURE's experiments, supposes that something takes places analogous to the mutual action of zinc water on carbonic acid, in which the zinc is rusted by the water, and the oxide of zinc combines with the carbonic acid to form carbonate of zinc; or, in other words, the living organism acts the part of zinc in galvanic decomposition.

If water, then, does not contribute to the nourishment of plants by its chemical composition, it must be only as the proper conductor of such substances as are necessary, and which can only be carried through such complicated tissues in a state of solution, whether pumped into the plant immediately by means of the spongy ends of the roots, or imbibed from the air by means of the stomates. Other arguments still remain, which we must reserve to a future occasion. *M. J. B.*

SOME 25 years since an English nobleman purchased in Italy, for a large sum, from an honest dealer there, a marvellous plant, which, as he thought, confirmed the old VIRGILIAN tale of Apples growing upon Plane trees. At least it appeared to his lordship to negative the general belief that dissimilar species cannot be made to unite by grafting; for here he had a Jasmine, a Honeysuckle, a Myrtle, and an Olive, all grafted on an Orange tree and flourishing luxuriantly. In due time the specimen reached England, and was for many months the admiration of the intelligent visitors at * * *. The clergyman of the parish, a very learned gentleman, who was familiar with everything except "common things," ransacked the classics for similar examples, and the soundness of VIRGILIAN physiology was triumphantly announced in the county paper, with an astonishing array of quotations from Greek and Latin authors. In short the famous

discovery that Maize and Tobacco were known to the Greeks and Romans, shrunk into insignificance before the parade of classical authority in that peculiar department of vegetable physiology which treats *de antiquis inserendi rationibus*. Let us add that the unlucky gardener at * * * was looked upon as a poor creature when he failed in grafting a Myrtle on a Gooseberry bush.

It appears from a statement by Mr. FORTUNE that the Chinese are even more skilful than the Romans were, for they know how to make a Thorn (Photinia) grow upon a Juniper. In one of his interesting communications (*Gardeners' Chronicle*, 1853, p. 741) he tells us not only of this, but that the Chinese claim greater powers of the same nature, for they take their common Pine tree as a stock on which to graft their eatable Myrica by way of improving its size and quality! A drawing sent home by Mr. FORTUNE, of which the annexed is a copy, will enable the reader to form some idea of the appearance of this Photinia on its Juniper stock.

We need not say that all these tales, like the ancient authorities so learnedly quoted by our classical friend, are mere fables; and that the examples by which they are supported, whether new or old, are instances of fraud and credulity.

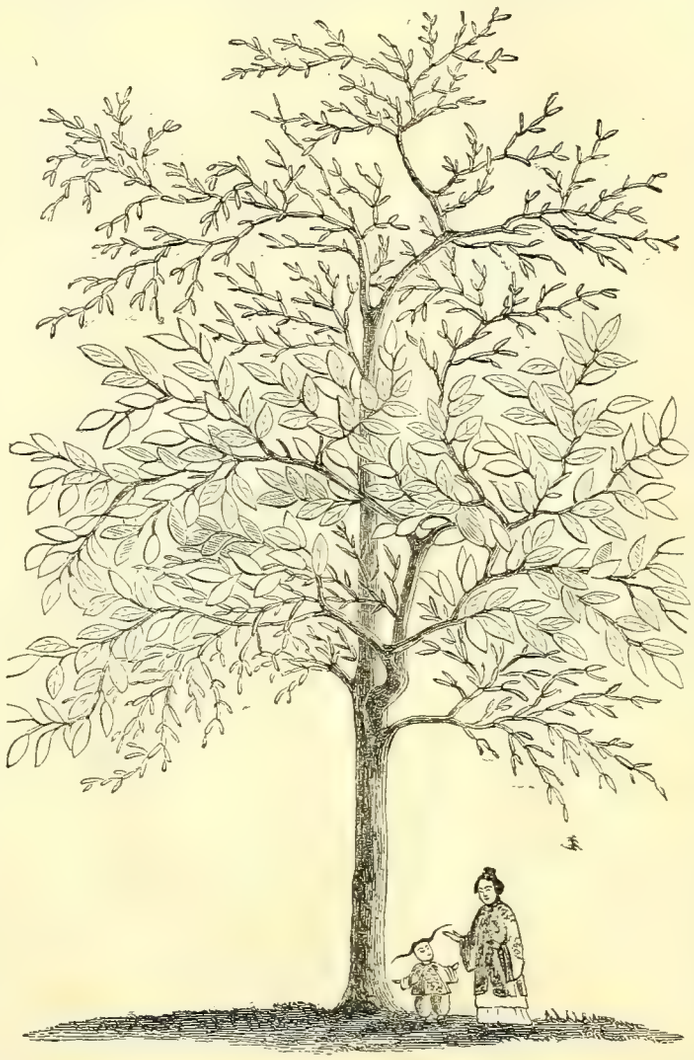
In the park of his Grace the Duke of DEVONSHIRE, at Chiswick, there is a very old Cherry tree, which has been decayed in the centre for many years. Its hollow trunk has, however, been occupied by a common Birch tree, so that the same stem appears to support a top composed of Birch and Cherry branches. The Cherry trunk is 7½ feet in circumference, and 6 feet in height to the place where the branches diverged from it. To this height the Cherry tree once completely enveloped the Birch; but of late years the diameter of the Birch has increased so much that it has burst the decaying case of Cherry wood on the north-east side, where it is partially exposed to within 18 inches of the ground. Below this, the cylinder of Cherry wood is still complete. It is not surprising that the Birch should have burst the Cherry on the north-east side; for that side has usually the thinnest layers of wood, and would consequently give way the soonest to the expanding force of the Birch. The latter is now above 50 feet high, and measures 5 feet 4 inches in circumference at 6 feet from the ground, where it issues from the hollow Cherry. The portion of Cherry tree still alive is 20 to 25 feet high. This is evidently a natural explanation of the history of Mr. FORTUNE's tree; and some such cases in ancient days may be well supposed to have given rise, in the first instance, to Virgilian fables, and afterwards to ingenious imitations.

The trick by means of which are obtained such trees as that to which we adverted in the beginning of these remarks, is now perfectly understood, and 30 years since was explained, under the name of "Impostors Grafting," by the late ANDRÉ THOUIN, from whose article *Greffe* in the *Nouveau Cours d'Agriculture* (1822), the following is an extract:—

"The so-called *greffe des charlatans* is nothing more than a plantation formed within the trunk of a tree, which has been hollowed out longitudinally quite into the ground below its roots. One or more young plants furnished with good roots are drawn through the trunk, and their roots are then covered with rich vegetable mould. These plants grow vigorously, fill up the cavity in the trunk with their stems, which squeeze closely together and eventually form at the top of the opening a swelling which perfectly resembles that produced by grafting.

"In this way was most probably formed the group of trees which PLINY the naturalist observed in the gardens of LUCULLUS at Tivoli, and which is described in his 'Natural History.' On the trunk of one tree he saw branches, some of which produced Pears, others Figs, Apples, Plums, Olives, Almonds, Grapes, &c.; but he adds, a little farther on, that this wonderful tree, which he considered as produced by the art of grafting, did not live long, and that it died some years after he first examined it.

"It is more probable that this tree had been formed merely by planting different species within some others in the way above mentioned, from the fact that at the present day at Genoa, Florence, Venice, and Rome, trees still continue to be formed in that manner. In some gardens at these places may be seen stems of Pomegranates, Myrtle, Lemon and Orange trees, from the midst of whose natural branches



spring Jasmines, Roses, double-flowered Myrtles, and other shrubs of different genera, united by this process, of which the owners are very proud, and

make a prodigious mystery. In most instances only one species is introduced into the strange trunk, but sometimes you see numerous examples of different forms and kinds with the most brilliant colours associated in the same tree."

M. THOUIN further tells us that he himself tried the operation with perfect success upon both a Lime and an Ash tree a foot in diameter. He contrived to give both of them heads consisting of Plums, Hazels, wild and cultivated Services, Walnuts, Peaches, and Vines, the branches of which were thoroughly interlaced. Of one of these he gives a figure, which we reproduce, and which perfectly illustrates the system.

We beg leave to offer this to the notice of all credulous and ignorant travellers, in the hope that it may teach them to use their understanding to more purpose than those do who bring home tales of Oranges grafted on Pomegranates, in order to become blood-red, or of Roses grafted on Black Currants to make them black, or even of miraculous trees with leaves covered by Tibetan characters.

VEGETABLE PATHOLOGY.

No. I.

A VARIETY of circumstances, but more especially the severe and widely extended maladies which have of late years affected some of the more important objects of cultivation, have concurred since the commencement of this Journal to call the particular attention both of scientific and practical men to the diseases which affect the vegetable world. Many papers, in consequence, of more or less importance have appeared in our Journal and elsewhere, both in this country and on the Continent, but the process of reference has now become so long and perplexing, and the amount of information so large in point of mere bulk, that it seems desirable to place before our readers, in a compendious and more easily accessible form, all that is well ascertained upon the subject as far as our own experience and access to recorded information may enable us to do so. We propose, therefore, to institute a series of papers after a plan which will be presently stated, comprising everything really valuable, both in theory and practice, which can be supposed at all to come within the scope of an intelligent cultivator, and open to new information from every available source. It is purposed, indeed, to adhere strictly to the plan which has been laid down, in order to avoid as much as possible the confusion which must necessarily attend mere desultory essays or papers; but, inasmuch as the series may possibly be of considerable extent, as important forms of disease may arise, or interesting information respecting those which have been already noticed, a system of numbering will be adopted, by means of which it will be possible to give supplementary matter, at once referable to its proper position in the series, considered as a whole. The method, then, which it is purposed to adopt will be as follows:—

After such introductory matter as may be thought necessary before a more formal commencement of the subject, the subjoined division is proposed:—

I. PLANTS IN A STATE OF HEALTH.
Under this head their nature and structure and mode of nutrition must be briefly stated; the manner in which they are affected by external agents, as light, temperature, moisture, &c.; their more prominent chemical conditions, and how these are modified by the vital principle or rather in organisms endowed with life.

II. WHAT IS DISEASE WITHIN THE MEANING OF THE TERM AS USED IN GENERAL BY CULTIVATORS?

III. THE CAUSES OF DISEASE.
a. Internal or constitutional.
b. External or accidental.
c. Doubtful or conjectural.

IV. CLASSIFICATION OF DISEASE.

a. Internal or constitutional.	*b.* External or accidental.
* Functional.	* Functional.
** Organic.	** Organic.

V. REMEDIAL MEASURES.

a. Certain.	*b.* Doubtful.
* Rational.	* Rational.
** Empirical.	** Empirical.

M. J. B.

GASTROLOBIUMS.

THESE are free blooming plants, of comparatively easy cultivation, and being of good habit, they form handsome specimens with no great amount of care. They may be increased either by means of seeds or cuttings made of the young shoots in a half ripe state. Let us suppose that a promising young plant in a 5-inch pot is in hand in March, ready to commence with, and in this case the beginning of the month will be a proper time to start it into growth. About that season, therefore, remove the plant to a light house, or pit, placing it near the glass, where the night temperature may average about 50°,

allowing it to rise 10° higher on sunny days, with a circulation of air. Ascertain at once whether the roots require more space, and if so, give a moderate shift, but unless the ball is full of healthy, active roots, defer shifting until that is the case. A compost, consisting of three parts of prime, turfy peat, and one part light, turfy, sandy loam, mixed with a fourth of silver sand, and a quantity of clean, small potsherds, will be found most suitable for the Gastrolobiums. The peat and loam should be nicely broken up, selecting only the best; and the material should be well intermixed, taking care to have it in a moist but not wet state when wanted for use. In shifting, use clean pots, and be careful to ensure perfect drainage, by placing plenty of potsherds in the bottom. After shifting keep the atmosphere as moist as possible, syringing the plants over-head morning and evening, so as to avoid the necessity of giving much water to the soil till the roots reach the sides of the pot, which will happen in course of a fortnight or so. When fairly established after potting, and in free growth, give air liberally on fine days; also water the soil more freely; but in all stages of their growth Gastrolobiums require to be watered very carefully, as their delicate roots are very apt to suffer from an excess of this element, and if allowed to become too dry they will soon be infested with red spider. Never apply water, therefore, without first ascertaining that it is wanted, and then give sufficient to thoroughly moisten the ball. Tie out the shoots, and stop the stronger ones as may be required to secure a compact bushy habit of growth. Remove the plants to a cold frame as soon as can be done without danger of checking the growth by sudden exposure to a lower temperature. The treatment here during summer will consist in keeping the shoots properly tied out, and stopping any over luxuriant ones, so as to maintain a bushy habit of growth; shading on the forenoons of bright hot days, giving air freely, and maintaining a moist atmosphere. In warm weather it will be of great service to the plants to close the frame early in the afternoon, after moistening them over-head, raising the lights at the back before leaving for the night, as this produces a congenial moisture and greatly promotes active vigorous growth. A second shift will probably be required in June, and this should be afforded as soon as it may be necessary, and before the roots have become matted; a liberal shift may be given to such as may be ready for repotting in June, but this must be regulated by the health of the specimen, &c. Most of the varieties are somewhat subject to the attacks of red spider, particularly if in middling health, and no time should be lost in thoroughly eradicating this pest the moment it is perceived. Lay the plants upon a clean mat in such a position as will permit the under sides of the foliage to be well washed without saturating the soil, and repeat this operation every other day, until the spider shall have been fairly got rid of. Use tepid water, and repeat the washing occasionally as a preventive.

Discontinue shading as soon as the heat of summer is over, and when it can be done without danger from heavy storms of rain, expose the plants to the night dews in August and September. When cold uncongenial weather sets in, remove them to a light airy part of the greenhouse for the winter, and during this season apply water with great care; also keep a sharp look out for red spiders, and give any infected plant a good washing with the syringe. The plants may be allowed to remain in the greenhouse until they come into bloom, which will be in April, or later according to the temperature at which the house may be kept; a dry cool atmosphere, in which the flowers will endure longer than elsewhere, should be afforded while the plants are in bloom, and they should be guarded from bright sunshine.

After blooming, cut back the shoots sufficiently to insure a close form of growth, removing all seed-pods which may have made their appearance, unless any seed should be wanted. Give a moderate shift, and keep the specimens in the close end of the greenhouse until they start into growth, when they may be removed to a shady part of the plant ground, taking care to prepare them for the removal, by exposing them to a very free circulation of air for a time before placing them out of doors. *Alpha.*

DEEP CULTIVATION.

Some time ago, in the *Gardeners' Chronicle*, Dr. Lindley writing on the culture of late Peas, drew attention to the importance of the process of deeply loosening and aerating soils, technically called trenching.

As the season in which such work is usually done has now arrived, I have thought that a few observations based on the result of some experience might be useful in leading others to reflect upon the importance of the results which follow this process, and perchance to adopt it where practicable. I take it for granted that no one will dispute the importance of such a mechanical arrangement of the particles of soils as will allow the delicate roots of plants to range freely in seach of food, more particularly the roots of esculent vegetables, in dry and hot summers.

Believing fully in the advantages which follow this practice, as far as gardening results are concerned, and believing, too, that the progressive deepening beyond the shallow furrow with which many of our agricultural friends are content would be highly advantageous to them, I venture to offer these remarks, and to endeavour to reconcile them with approved and modern theory.

Of the twin-sisters, Agriculture and Horticulture, the latter art, while it is the most ancient of occupations, is also the most varied and elaborate in its processes; but the general and fundamental principles on which success depends are the same. Is the abstraction of superfluous moisture from the soil of vital import to the farmer, it is equally so to the gardener; and is not the one as much interested as the other in deepening and disintegrating the soil, in setting free its mineral ingredients, in the decomposition of organic matters, whether animal or vegetable, and in facilitating by every means the absorption of the gaseous constituents of the atmosphere? These are all elements of success, of equal and vital consequence to both parties. But there is an exception to be taken in the case of the farmer. While the gardener cannot have his land in too high a state of cultivation, to suit his ever varying and constant requirements, or his soil too rich, to suit the gross-feeding plants which he cultivates, as Asparagus, Rhubarb, Cabbages, Celery, Cauliflowers, &c., which depend for their good qualities upon the most rapid growth, and consequent succulence, tenderness, and crispness, the farmer in his most valuable cereal crops requires only a certain amount of luxuriance; if his straw is over fed with manure, and deficient in silicates, his crop is laid prostrate, and he is said "to farm too high." Some time ago, I think the Rev. L. V. Harcourt remarked in this Journal to the effect, that there is an economic point in farming, which if exceeded is not remunerative. "It is a great point," says a friend of mine, an extensive occupier, and one who has realised money by practical farming, "to know when the land is just sufficiently well done." The demands of the gardener upon the soil he cultivates are more continued and varied than those of the farmer; he generally speaking can allow little time for a fallow, and is frequently obliged to plant a second crop between one which has not completed its growth. How important then to seize all opportunity of turning and exposing the soil to atmospheric influence, as his supplies of food must be in a proportionate ratio. Deep spade culture and manure fresh and rich in ammoniacal matters are his resources, as testified in London market gardening.

But notwithstanding that market gardeners find deep digging profitable, and set us an example the correctness of which we cannot doubt, I am not exaggerating when I say that a majority of gardens are set down as "worn out," because they have not been half cultivated. I know many where the soil is only muddled over a shallow spade's depth, where the *pan* (as farmers call it) is never broken to a greater depth than an old-fashioned plough would leave it. Can such culture year after year tend to restore those elementary principles which have been abstracted by former crops, which when taken away have largely diminished the amount of mineral and saline matters, and which if continued cropping is practised will by degrees render the surface soil less and less productive until it is exhausted or "worn out." It is usual to apply a dressing of fresh soil to such ground, thereby restoring a supply of those inorganic substances which have been taken away from it.

It is customary for farmers to apply to their land which is deficient in lime a mixture of that substance and parings of turf from the sides of roads, ditches, and waste ground. This is a most valuable compost, partly owing to the solvency which lime gives to the organic substances, but perhaps largely consequent upon the mineral salts or inorganic elements of vegetation which it restores, and which the processes of cultivation reduce to an available form, as food for the future crops.

It is not wise to build castles in the air upon the ephemeral foundation of crude and visionary things; but while I must not be understood as deprecating the use of extraneous manures, I fully believe that all soils contain within themselves a much greater amount of fertilising matters than is generally supposed, provided always that means are taken by man to develope those hidden stores which are at his disposal, by deep cultivation and aeration.

An all-wise and beneficent Providence has placed the elements of vegetable life at our disposal—in the air which surrounds us, the rain which falls upon us, and in that earth from the "dust" of which, in the emphatic language of Holy Writ, we were formed; and to which the phosphates and carbonate of lime which so largely constitute, as bone, our skeletons must soon be returned; perchance to form new combinations in some of the ever-varying forms of vegetable life, and again to contribute their share to animal existence. But delightfully interesting as it is to trace these mutations of matter to their infinite source, our present purpose is limited to supplying them and their allied elements as available food for plants, and upon setting a proper estimate upon the valuable resources we have in the air, the rain, and the earth, if subjected to a course of cultivation — I say advisedly the valuable resources which mother earth affords independently of extraneous matters termed manures.

In proof of the position which I have advanced, I may mention that five years ago I took a piece of poor ground, upon which unhealthy Apple trees had long grown, into cultivation for culinary purposes. In the first year it was deeply trenched, receiving as manure only a small quantity of half-rotten leaves; after lying in a rough state for some time, and having frequent forkings, it was sown with Peas at large intervals, dwarfer summer Vegetables being grown between the rows. The crops of this legume were, in an extraordinary degree, fine and productive. At the first trenching a small depth of the bottom was picked up and left there, but in the following year, this was brought to the surface, when the process was in all respects repeated, the ameliorated soil from the bottom being annually brought up and mixed with the other earth. I have now grown four successive crops of equally fine Peas upon the same ground, and feel confident that by this cultivation, to use a homely phrase, I keep the soil "in good heart." Mentioning my practice and its results one day to Dr. Lindley, he kindly recommended me to procure the "Word in Season," a pamphlet I had at that time not heard of. I instantly got it, and I am a full and confiding believer in the theory of its reverend author, notwithstanding the practical scoffing and sarcasm which it has elicited. Whether the system is practicable and profitable on a large scale it is foreign to my intention to discuss. I leave this, therefore, to those whom it more immediately concerns.

All authority and experience acknowledges the importance of rendering soils permeable to water, air, and the roots of plants; the elementary principles of organic matter, the carbon, hydrogen, oxygen, and nitrogen are admitted and absorbed by the earth, its inorganic stores are developed by atmospheric agency, and free access is given by loose mechanical arrangement of the particles of soils to the tender rootlets. Let us then dig deeply, and remember that the earth contains hidden treasures, which those "who seek may find."

Let me not be misunderstood. I do not advocate the bringing to the surface a mass of crude soil, but a progressive deepening and bringing up only a small quantity which has for some months been subsoiled. I have long practised a system of biennial trenching, and I think that when a depth of 30 inches is obtained, it is impossible, or next to impossible, to exhaust a soil of the inorganic matters which plants require, if trenching and aeration are fully carried out; matter being infinitely divisible, and each separation of particles giving up fresh supplies. *Henry Baily, C.M.H.S., Gardener to G. Harcourt, Esq., Nuneham, Oxford, Dec.* 23.

Home Correspondence.

The Barbarossa Grape.—I have just read the article (see p. 833, 1853) from "J. B. W.," relating to this Grape; and in answer to his inquiries as to where it came from, I have only to annex a list of Vines I purchased in 1839 and 1840, at Isola Bella, on the Lago Maggiore and the Botanical Gardens in Naples, and request him and your readers to point out which the Barbarossa really is (Mr. Bevington, my then gardener at Welcombe, having lost the tallies). I have never thought the Grape rightly named, but I feel satisfied it is one of the under-named, to which I have added an asterisk:—Aleatico, Alicanthe, Altessa de Cipro, Barberossa, * Galetta (this is a first-rate Grape—nothing better), Hermitage, Lacryma Christi, * Lambrusca, * Blanquetti violette, * Montpellier grandes grappes, Montepulciano, * Damasco nero, Zibetto, Zibibbo. There are 500 different kinds in each of these collections, and of course many thousands in France. *Charles T. Warde, Clopton House, Stratford-on-Avon.* [Welcombe was sold by Mr. Warde to Mr. Mark Philips five years since.]——Permit me to correct a mistake which you have made in regard to this Grape. It was introduced to this country with many others from Italy, about 15 or 16 years ago, by C. T. Warde, Esq., of Clopton House, Stratford-on-Avon, and not by Mr. Mark Philips (the present proprietor of Welcombe), as you have stated; it was planted in a Pine stove at Welcombe, where it stood for several years before it fruited, and it was not until the growing of Pines in the house was discontinued that the true character of this Grape as a good, long-keeping, late variety was ascertained. It is very different in every respect from the Wortley Hall Grape, so fully described in Lindley's "Guide to the Orchard," No. 40, or from Money's "Eschollata," which is a synonyme of the Poonah introduced by Sir J. Banks in 1817, see *Gardeners' Chronicle*, Vol. I., p. 201; and Lindley's "Guide," No. 29. The Black Raisin and the Black Muscadel are also very different. I have had the three last sorts under my charge at Picton Castle, Pembrokeshire, and the fruit has answered the description of them in Miller, Speechley, and Lindley. In the Hort. Soc. Fruit Catalogue, Mr. Thompson has fallen into an error in placing the last two sorts as synonyms of the Black Morocco, which is quite different from either of them. But to return to the Barbarossa: it came with that name, and is probably the same Grape which Miller notices as Barbaroux, in his account of the Provence Vines and wine making. I do not positively assert that this variety has not been introduced previous to the time above stated, and under another name, but I have never yet met, in any authority from Miller downwards, a description that would apply to this Grape. It is a very strong grower, wood very dark red, long jointed; eyes large and bold; leaves large glossy, coarsely serrated with long footstalks, changing early in the autumn to a most beautiful marbled dark red; bunches very large and long, well shouldered; berries large roundish oblong, and when well coloured very black, with a fine bloom; skin thin, tough, not liable to crack like many thin skinned Grapes; flesh juicy and rich, though not so high flavoured this season as in former years; there can be no question as to its long keeping qualities, as it has been preserved on the Vines at Welcombe fresh and good till March; and as to its superiority to Oldaker's St. Peter's, I state candidly that I give the preference to neither. Were I required to grow very late Grapes, I should plant both sorts in the same house, as the treatment of the St. Peter's, as practised by Mr. Oldaker some years since, will suit

the Barbarossa perfectly. *William Cooper, Charlecote Park Garden, Stratford-on-Avon.*

Temperature.—The following is a table of the temperature here. The thermometers for the maximum and minimum of the atmosphere are well secured from the direct heat of the sun and radiation at night, and have a free circulation of air. The thermometer laid on snow last night was 2° below zero, the air 5° above.

T. Southall, Wellington Road Birmingham, Jan. 3.

Ageratum mexicanum.—Having noticed, at page 741, 1853, some remarks respecting the use of this Ageratum, as a useful winter greenhouse plant, allow me to add that I have grown it as a stove plant with equal success. My method is to strike cuttings of it about the end of June, placing three cuttings in a 5-inch pot; when fit to pot off I pot them singly into 4-inch pots, placing them in a gentle bottom heat. The last shift they get is into 11-inch pots, in the end of August, placing them for a short time in a cooler temperature, and pinching out the heads of the shoots, in order to keep them dwarf. I place them in heat in September, using the syringe freely, and under this kind of treatment they afford me a fine display of blossoms until Christmas. *James Hall, gr., Hawford House, near Worcester.*

Shingles.—Oak bark is used in Lord Carnarvon's Park, and on some cottages near it, at Burclere, near Newbury, Berks. For garden ornamental roofs it is preferable to anything, even thatch, as it never looks raw or new, and has from the first a pleasant tone, and in shade lasts longer than thatch; it is nailed when moist, I think, in shingles 1 foot by 6 or 9 inches. I do not see why Larch bark, Red Willow, and perhaps some few others would not do nearly as well, particularly Birch, if they are flattened out before dry. I may, perhaps, be allowed to add, that whilst all our flowers are gone, there are the Orange Gourds as bright as ever; the frost has not softened them as yet. *Somerset.*

American Monies.—As the value of the currency of the United States has been a subject of inquiry in recent numbers of the *Chronicle*, it may be stated that no definite value can be assigned to it, because it varies in different States. In some parts the dollar passes for 8*s.*; in others for 4*s.* 8*d.* Whilst this is the case, it will, nevertheless, be useful to emigrants and others to know the real value of the coinage according to the Government standard. This has been ascertained by M. Bernard and M. Neuhaus, of the Exchange and Mint of Paris. They have given, in the "Annuaire of the Bureau des Longitudes," the weight in grammes; the degree of fineness of the metals, or in other words the per centage of alloy; and the value of each piece in francs. From the data thus afforded, it appears that the *Gold coinage* consists of nine parts of pure gold and one of alloy; and by the law of the 3d March, 1849, the piece of

Frosted Greens.—Will you have the goodness to inform me under what circumstances persons have been poisoned by eating Greens in frosty weather, and whether there are any external indications of the vegetable being in an unwholesome state. I have eaten Greens during many winters with impunity, but I should be sorry to do so once too often. *D. E. L.* [We always thought that Greens were the better for being frosted.]

Societies.

BOTANICAL OF EDINBURGH, *Dec.* 3.—Professor BALFOUR, in the chair. The following papers were read:—1. "Notice of a Botanical Trip to Helvellyn, with pupils, in July, 1853," by Prof. Balfour. The party, consisting of 45, left Edinburgh at noon, on 21st July, by the Caledonian Railway, for the Lake district of England. Reaching Carlisle soon after 4 P.M., they proceeded to Kendal. On the way to Ambleside they gathered an abundance of Stachys betonica, Sanguisorba officinalis and Lactuca muralis, plants, the last of which does not occur in the Scotch Flora, while the others are rare. The time was too limited to allow of a full examination of the shores of Windermere, and darkness came on ere the party reached their inn at Ambleside. Next morning (22d) some of the party were up at half-past four, eager to commence their rambles; they proceeded to Stockgill Force, and in the neighbourhood of that celebrated waterfall gathered a number of rare plants, including Impatiens Noli-me-tangere, Festuca sylvatica, Hymenophyllum Wilsoni, besides some more common plants, as Campanula latifolia, Polypodium Phegopteris and Dryopteris, with Scolopendrium vulgare. After breakfast 39 of the party started for Rydal, while six remained to examine the country near Ambleside. The walking party gathered Sedum album, reflexum, and Telephium, Sempervivum tectorum, and Meconopsis cambrica. They also picked Tilia parvifolia in fine flower. On the banks of the Rydal Water, and the grounds in the vicinity, the following plants were seen:—Quercus sessiliflora, Lastrea Oreopteris, and a variety of L. Filix-mas with singularly contorted fronds. In Rydal Lake the party gathered Lobelia Dortmanna, Myriophyllum spicatum, Potamogeton natans and oblongus; and on its banks, Carex vesicaria and dioica, Rhynchospora alba, Hypericum Androsæmum, and Berberis vulgaris. On the neighbouring roadside, Staphylea pinnata, Drosera rotundifolia, Anagallis tenella, Parnassia palustris and Narthecium ossifragum, were seen; and on the hilly grounds near Grassmere, Jasione montana, Allosorus crispus, which may be called the predominant Fern of the district, and Sedum anglicum. Between Grassmere and Dunmail Raise, Saxifraga umbrosa was obtained; and near Wythburn, Solanum Dulcamara. The party then proceeded to ascend Helvellyn, which rises at upwards of 3000 feet. In the ascent they gathered Saxifraga aizoides, stellaris and hypnoides, Lycopodium clavatum, selaginoides, alpinum and selago, Alchemilla alpina, and Oxyria reniformis. The party reached the top in a thick mist, cold and wet. They waited patiently for a time in the hope that some favourable change might take place, but seeing no prospect of this, they proceeded to Swirrel Edge with the view of descending to the rocks below. They had not, however, proceeded far down when the mist suddenly began to clear off, and the beautiful scenery around became visible. As the clearance continued to progress, there was a loud cry, "To the summit!" "To the summit!" "To the summit!" Accordingly they willingly retraced their steps. On reaching the top, they were gratified by one of the most splendid scenes they had ever witnessed. The thick mist gradually rose, and ever and anon displayed some interesting spot, some peaked or rounded summit, some lake or estuary, until at length the whole curtain rose, the sun shone in all its brilliancy, and the entire lake district was illuminated. It is not easy to describe the ecstacy of the party, as scene after scene opened up to their delighted eyes, and when the whole mountainous district was discerned by them, their enthusiasm rose to the highest pitch. Scrawfell, Bowfell, Honister, Craig, Borrowdale, Skiddaw, Saddleback, Windermere, Coniston, Esthwaite, Morecombe Bay and its islands, the Solway, the Hills of Northumberland, were all distinctly seen. Below the summit, between Swirrel Edge and Stridling Edge, they gathered Saxifraga aizoides, stellaris, nivalis, oppositifolia, and hypnoides, Oxyria reniformis, Poa alpina vivipara, Festuca vivipara, Alchemilla alpina, Juncus triglumis, Carex rigida (which was also seen on the summit), Thalictrum alpinum, Hieracium alpinum and Lawsoni, Cerastium alpinum, Vaccinium Vitis Idæa, Rubus saxatilis, Polygonum viviparum, Splachnum mnioides, Polytrichum alpinum; also, Cochlearia officinalis, Viola sylvatica, Alsine verna, Sedum Rhodiola, Solidago Virgaurea, Veronica serpyllifolia var. humifusa, Armeria maritima, Salix herbacea, and Juniperus nana. July 23.—After breakfast, the party proceeded by the shores of Ullswater to Gowbarrow Park, visited the waterfall, and then walked to Pooley Bridge; the following plants were gathered:—Hieracium boreale, prenanthoides, Senecio aquaticus, Hypericum maculatum, hirsutum and humifusum, Stachys Betonica, Aquilegia vulgaris, Prunus Padus, Ligustrum vulgare, Sanguisorba officinalis, Calamintha Clinopodium, Lactuca muralis, Spiræa salicifolia, Serratula tinctoria near Pooley Bridge, Quercus pedunculata, and sessiliflora at Gowbarrow, Genista tinctoria, Galium boreale and Mollugo near Pooley Bridge, Thalictrum saxatile, Geranium phæum, and G. nodosum and Papaver somniferum, both near a cottage. The best plants were gathered between two and three miles of Pooley Bridge. After passing the Bridge, Plantago media was gathered abundantly on the roadside. The party walked to Penrith by the Round Table and Brougham Hall, gathering Potentilla reptans, Malva moschata, Galium Mollugo and Plantago media.—2. Notes of a Tour on the Hartz Mountains. Part III. By Dr. Lindsay. 3. On the Physiological and Therapeutical actions of Cannabis indica. By Dr. J. B. Balfour, Kilsyth. 4. Notice of Plants found in the neighbourhood of Dollar in the autumn of 1853. By Dr. Balfour. Dr. B. now recorded a few of the more important species, namely, in the immediate vicinity of Dollar the rare Rumex alpinus, on the banks of the Dollar water, and by the roadside near the Rumbling Bridge and Mackart. Equisetum umbrosum abounds on the banks of the Devon, near Cauldron Linn, and is likewise found near Castle Campbell, on the Dollar water, where also occur Rubus saxatilis, 12 Ferns, including Hymenophyllum Wilsoni, and Cystopteris fragilis; Festuca sylvatica, Poa nemoralis, &c. On the Ochils the following plants occur:—Saxifraga stellaris and hypnoides, Juncus triglumis, Epilobium alpinum and alsinefolium, Sedum villosum, Hieracium prenanthoides, Lycopodium alpinum, Selago, selaginoides and clavatum. Near the summit of Ben Cleugh, Gnaphalium supinum and Salix herbacea were found; and at the Cauldron Linn, Carex pendula and remota. The following were noticed by Mr. Westwood:—Arenaria rubra, Paris quadrifolia, Trientalis europea, Lathrea squamaria, Neottia Nidus-avis, and Meum athamanticum.

Notices of Books.

A Popular Account of the Ancient Egyptians. Revised and abridged from his larger work, by Sir J. Gardner Wilkinson. 2 vols. small 8vo. Murray: with 500 woodcuts.

No Christmas book could have been more acceptable than this cheap but excellent edition of Sir Gardner Wilkinson's great work on the Egyptians. The woodcuts are well drawn and well printed; besides which the learned author has added matter rendered necessary by recent discoveries, in order to complete his history. Moreover, there is a capital Index, which greatly increases the sterling value of the volumes before us. The student of the Scriptures, whose means did not enable him to possess the original work, although indispensable to him, has now the opportunity of acquiring it upon easy terms, while to the general reader it is no less welcome as an inexhaustible mine of information concerning a people whose manners and customs must have been a subject of curiosity from earliest childhood. It would be presumption in us to criticise such a work in this place, but we cannot forbear asking Sir Gardner whether the fruits represented in the wicker basket at p. 43, vol. i., were not Figs or Pomegranates rather than Grapes.

Letters on the Condition of the Working Classes of Nassau, by T. Twining, jun. G. Barclay. A pamphlet.—Now that attention seems to have taken a turn towards the desirableness of teaching common things which are useful, rather than uncommon things which are useless, it is to be hoped that the present pamphlet will find numerous readers. It contains an excellent detailed account of the manner in which industrial education is conducted in the Duchy of Nassau. The following extract from Mr. Twining's introduction explains how he has done what we regard as extremely well done:—"During more than 20 years spent in various parts of the continent, I have often seen capable minds and ready pens wander unemployed through the most valuable fields of information, and have frequently noticed how many useful observations, which the zest of a definite purpose would render delightful to make, remain unmade, or are doomed to sleep away their existence in the Lethean pages of a family diary. I hope to see adopted during the coming winter session arrangements by which the council of the Society of Arts may induce many travellers to offer their services to the society, for acting under instructions which would greatly facilitate inquiry, and secure uniformity of purpose. It is, then, the humble ambition of the present little pamphlet to be but No. 1 of a long string of miniature likenesses, each representing the industrial features of some foreign country, and each somewhat rounded in itself, yet only acquiring its full value by the concatenation and joint meaning of the whole. In each country, those industrial features will of course be most dwelt upon which are most prominently developed, most different from what we see at home, or most commend-

able for imitation. The Duchy of Nassau is not a manufacturing country—the produce of its manufacturing industry is not to be compared to that of its vineyards, or to its mineral wealth—nor does it possess technical institutions like those described by Dr. Playfair in his valuable account of the training colleges of Germany; but its system of elementary education, its regulations concerning the apprenticeship of artisans, and the examinations they have to undergo, and the various means which its remarkably centralised administrative system affords for influencing beneficially the condition of the poorer classes, are well worthy of consideration. On most of these points, and also as regards the mode of the working population (Proletariat), their wages, expenditure, and resources, it is a very good sample of the south-western part of Germany; and in many respects it will be found to present a very convenient standard of comparison to those who may undertake the review of the neighbouring States. I have spared no pains to ensure for my statements the greatest attainable degree of accuracy. My plan has been to draw up a series of classified queries, calling attention to the special information I required, to employ a well-qualified person to collect it, and after getting into a readable form the materials thus procured, to submit them to friends competent from their official or professional position to judge of their accuracy and to supply deficiencies; and in this, as well as at every step of my task, I have been favoured by them with an amount of courtesy and zealous co-operation, for which I cannot too warmly express my acknowledgments."

The Foreign Tour of Messrs. Brown, Jones, and Robinson (Bradbury and Evans) is a 4to volume, containing 80 leaves of admirable sketches by Richard Doyle. For a winter's evening, it furnishes an unfailing source of amusement to the idle; while to the artist it is equally recommended by the singular skill with which many of the most crowded scenes are managed. In this respect indeed, G. Cruikshank and R. Doyle are unrivalled in the present day. Although extravagant and fantastical, as may be imagined from the title of the volume, the author may, nevertheless, justly claim for his volume a place among works of high art. We would more especially point to the scene where the Rhine boat is starting from Bonn, to the "doing" Cologne cathedral, the Jew quarter in Frankfort, and the interiors of the gaming-house at Baden, and the billiard-room at Prague, which have never been surpassed in their peculiar style.

Deane and Dray's Illustrated Almanac, although last in the field, is far from being the least of its class; on the contrary, it excels its contemporaries in the number and quality of its illustrations, and equals them in the useful knowledge collected in its pages.

New Plants.

35. HIPPEASTRUM FORMOSISSIMUM.

H. tubo brevi, fauce paucè tuberculatâ, perianthii laciniis angustis canaliculatis undulatis elongatis obtusis apiculatis, staminibus stylo multò brevioribus, stylo perianthio paulò breviore.

This plant was obtained from the late Dean Herbert's collection, by Charles Leach, Esq., of Clapham Park, with whom it has just flowered. The Dean does not appear to have had any knowledge of it, for we find no record of it among his MSS. now in our possession. In colour the flowers are singularly like those of the Jacobean Lily (*Sprekelia formosissima*), but in form and magnitude they may be compared with H. vittatum or the mule Johnsoni; there is a little green at the base of the flower, otherwise it is one sheet of the deepest crimson. The long narrow channelled obtuse apiculate segments and the very short stamens are apparently good marks of distinction. A hothouse bulb of very great beauty, not much disposed either to flower or produce offsets.

36. DICHORIZANDRA PICTA, *W. J. Hooker, B. M.* 4760.

Among the plants with variegated leaves now coming so much into fashion, is one with broad glossy foliage often edged and stained with dark dull brown, but pale green and pink on the under side. Having now flowered at Kew, it proves to be a species of this well known showy Brazilian genus, remarkable for having cream-coloured sepals, and large rich violet petals. The flowers appear in short downy slightly panicled racemes. The origin of the plant is unknown, except that it was received at Kew from Mr. Low, of Clapton.

FLORICULTURE.

PROPAGATION OF FANCY PELARGONIUMS.—About the beginning of February is as good a time as any for taking cuttings: select some good tops from the very best sorts that are out; get as many thumb-pots as you will require for the purpose; fill them with rich turfy mould, and put one cutting into each pot; but previous to filling the pots let them be well drained with broken charcoal or potsherds; then with a piece of round stick, make a hole an inch deep, fill it with silver-sand, and then put in the cutting, giving the pot a slight tap on the potting-board to settle the soil; dip a piece of stick into some water, and hold it downwards, in order that three or four drops may fall close to the side of the cutting, this will settle the whole together, and the quantity of water will be quite sufficient for three or four days; after that add a little more in a similar way, or with a fine-rosed watering-pot, as may be thought needful. When you have finished this part of the work, let all the pots be plunged in a slight bottom-heat, say from 65° to 70°; give a little air in the day-time, to prevent the cuttings from damping off. I do not recommend the practice of putting a great quantity of hard-wooded cuttings into one pot; two out of three will take root, and then you spoil several in getting them apart; strong cuttings struck singly in pots as directed, and well managed after they have rooted, will make fine specimens by June or July the following season. *S.*

CULTIVATION OF JAPAN LILIES.—These noble autumnal flowering plants form when in bloom objects of the greatest beauty, either in the greenhouse, drawing-room, or flower-garden; for they will be found to succeed well planted out in the open borders or beds. I have no doubt that they will shortly become general favourites for out-door work. The situation that should be selected for planting them in the open ground should be somewhat sheltered by shrubs or other means, in order to protect them from heavy winds, which are very injurious to the flowers and foliage. The best season for planting them in the open ground is February. At the time of planting examine the soil where they are intended to be placed, and if found wet, put some pots-herds at the bottom for drainage. Then place on these some rough fibrous peat and sand well mixed together, covering the bulbs 8 inches deep. If the bulbs are strong, they may be planted a foot apart each way, if intermediate sized bulbs, 9 inches will be sufficient. About the latter end of March, or the beginning of April, they will appear above ground. Should the weather at this period be cold or frosty, place some rough pieces of peat around their stems, and keep them covered with it until there is a favourable change. This will be found the best protection for them at that season, as well as adding to their strength and vigour when they are in a more advanced state of growth, as it will induce them to throw out their strong fleshy roots into the peat with the greatest freedom, and often cause them to form fine bulbs round the stem. Should the summer be hot and dry, some manure-water would be of the greatest benefit to them. It should be prepared from sheep or cow-droppings, but not over-strong, as it can be applied more frequently if given them in a moderate state. When they have done blooming in autumn, and show a disposition to rest, take them up, and put them in some dry mould, to keep them from shrivelling, placing them either in a room or shed until planting time arrives next season. It will be found that an over supply of water while at rest is the principal thing that will injure them; and after such an unusually wet season as the one just past, I would always advise all bulbs to be taken up in winter, as I have seen numbers of fine bulbs completely destroyed by too much wet. Should fine specimens be required in pots for decorating the greenhouse or conservatory, prepare some 14-inch pots; well drain them, and use the same compost as before recommended, selecting three of the largest bulbs for each pot, and covering them the same depth with the soil as in the open border. When potted, place them in a cold pit or frame, giving them plenty of air, but no water until they show their stems above ground, when water may be applied very sparingly at first, increasing the supply as they advance. When they have made growth from 12 to 18 inches long, place round their stems some large pieces of rough peat, which will cause them to throw out fine strong roots in great profusion, and invigorate their growth amazingly. In the month of April they may be placed in the open air in some rather sheltered situation, where they can be liberally supplied with manure-water. Should any portion of them be required for decorative purposes at an earlier period, they may be removed into the greenhouse, to forward them into bloom; but if not required early, they may remain out of doors until they bloom, and then taken to the place where their beauty is required to be seen. I have no doubt that shortly some very fine hybrids will be brought into general cultivation, as I have in my collection from 12 to 20 distinct varieties varying in shape and colour, some of them very robust in their growth, with a clear white ground, distinctly spotted with rich crimson; others of a pinkish ground, beautifully spotted; some with beautiful stripes and blotches upon white grounds, while others are of a delicate pink ground finely spotted, with very broad petals, and beautifully reflexed. These have been produced by hybridisation; and I have no doubt that many other cultivators of these beautiful plants have been trying their skill in the same way; and I hope ere long to see our present collection enriched by their perseverance and attention. *W. Barnes, Camberwell.*

Miscellaneous.

Flowering of Nelumbiums at Montpellier.—The *Revue Horticole* contains an article extracted from the *Gardeners' Chronicle* on the flowering of these two species in Lancashire, and observations upon the same subject by M. Martins. N. luteum flowered in water having a temperature of 75°, whereas N. speciosum did not develope its flowers till the temperature of the water was raised to 86°. At Montpellier these two species flower perfectly well every year in the open air, in wooden tubs or stone troughs, the water in which is only heated by the sun's rays; but N. luteum generally flowers about the end of June, whilst N. speciosum does not do so till the middle of July. There is usually an interval of 20 days between the flowering of the two species. This fact was furnished by the intelligent gardener who has grown them since 1835. It supports what has been observed in Lancashire, and proves that the Nelumbium from North America requires less heat for flowering than the one from India. The temperature of the water in which these two species flower never exceeds 77° in the day, at night it always falls 9° or 10°. In winter the Nelumbiums are placed in three different situations. Those which are planted in the stone troughs remain in the open air; the water is let off so that the rhizomes are buried in a thin mud, the water is replaced by leaves so as to fill the trough, which is then surrounded with a heap of leaves. The other Nelumbiums which grow in the large wooden tubs are removed, some into a greenhouse, and others into the orangery. In the greenhouse, the temperature frequently falls to 46° in the clear, cold, winter nights; and in the orangery it is sometimes only 4° or 5° above freezing; but these comparatively low temperatures are of short duration. Still in spring, when the tubs are again removed into the open air, the Nelumbiums which were kept in the greenhouse are observed to come into leaf before those which were wintered in the orangery or out of doors. These species would doubtless remain perfectly well all the year in the open air, in the south and west of England; for at Montpellier it freezes a little every winter, and in the months of January and February the thermometer falls for an hour or two in some nights to 12° or 13° below the freezing point; in the day it rises to 47° or 50°, and sometimes higher. But in the months of May and June, when Nelumbiums begin to vegetate, the temperature is high. In May the maximum always rises as high as 79°, and sometimes exceeds that temperature. In June the maximum in the shade is as much as 95°. In May, the minimum in the shade is rarely below 46°. However, in the beginning of May there are still some nights in which the thermometer falls, a little before sunrise, nearly to the freezing point. In July the minimum is never below 50°. In the beginning of July, the time when Nelumbiums generally flower, the maximum is every day more than 86°, and it frequently reaches 95°. The minimum is about the same as in June. It is evident that the English gardener must obtain artificially the amount of heat necessary for the flowering of these plants, by heating simultaneously both the water and the air; and it is worth while trying whether this plant could not be flowered in the open air in August, by raising the temperature of the water to between 104° and 113°. I have so often seen plants grow exceedingly well in warm water, that I am convinced that this new method of forcing might be successfully attempted.

Improvements in the Manufacture of Paper. By E. Maniere, Bedford Row. Patent granted June 9, 1853. (No. 1413).—This invention consists in applying asbestos in the manufacture of paper. For this purpose the asbestos is to be pulped and manufactured according to the methods practised in making paper of other materials; but by the employment of asbestos a fire-proof paper will be produced. The inventor claims the employment of asbestos in the manufacture of paper.—*Mechanics' Magazine.*

Effect of Sulphate of Lime on Vegetable Substances.—About six weeks since I was engaged in making various experiments on the effect of sulphate of lime on vegetable substances. A portion of the substances then used by me was carelessly thrown aside, and on returning to my experiments about a fortnight afterwards, I was surprised to find that decomposition had not taken place in those portions of the vegetables which had been subjected to the action of sulphate, while those which had not been so treated were completely decayed. Among the articles experimented upon were a number of Potatoes, each of which was affected by the prevalent disease; some of these remain sound to the present day, the others have some time since completely rotted away. Subsequently, I procured some more Potatoes, and also some Beet-roots, the former being, as far as I could judge, all diseased. I divided the Potatoes into three portions. One lot I placed in a vessel with a weak solution of sulphuric acid, and from thence I placed them in a solution of weak lime-water. In the second lot the process was reversed; that is to say, the Potatoes were first placed in the lime-water, and then in the acid. The third lot was left untouched. Ten days afterwards I examined the Potatoes, and found, as I expected, that the Potatoes which had not been treated with the sulphate were rapidly decaying,—those which had been first placed in the solution of lime and then in the acid were more nearly decomposed,—while those which had been treated in the mode first described remained as sound as when first taken in hand. Upon being cut open the diseased part of the Potatoes was not found to have spread internally, and the flavour of the root was in no degree affected by the application of the process, nor do I think that its germinating power was injured by the effect of the sulphate. The effect upon the Beet-roots was similar to that produced on the Potatoes, and which would seem to be somewhat analagous to that of galvanising metals, viz, protecting the substances from the effect of atmospheric agencies. I may add, that muriatic and other acids have been employed by me on other occasions with equal success, the only agents required appearing to be those which will most readily produce a sulphate in contact with the substances required to be preserved. I do not think that any insuperable difficulty exists with respect to the application of the process. The acid I employed was very weak—about one part to two hundred of water; the lime-water was about the consistency of milk. *The Chevalier Claussen, in the Chemist.*

Improvement in Garden Pots. By G. Wilkins, Queen's Road, Walworth, Surrey. Patent granted June 1, 1853. (No. 1340.)—This invention consists

in so shaping flower-pots, and such like vessels, as to form a reservoir for the supply of liquid manure or gas to the plants grown in them, such reservoir being capable of being closed for the purpose of preventing the escape of any offensive odours or of gas, as described. *Mechanics' Magazine.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

CONSERVATORY AND GREENHOUSE.—The present severe weather will render it necessary to employ a considerable amount of artificial heat, in order to prevent injury from frost; and unless great care is observed to maintain a soft moist atmosphere, the drying effects of so much fire heat will be highly injurious to the plants, especially to such as are in bloom. While severe weather continues be satisfied with as low a night temperature in all plant houses as it will be safe to keep, taking advantage of bright days to increase the temperature, and using a little fire heat, if necessary, in order to be able to admit fresh air to dispel damp, &c. The proper night temperature for the conservatory or flower house very much depends upon the kind of plants it may contain. Where Camellias, Epacrises, Heaths, and other winter blooming plants form the principal inmates of the house, 40° will be sufficiently high, and with a dry atmosphere it may safely be allowed to sink a few degrees on hard nights; but in cases where the hardier kinds of winter flowering stove plants are brought into the house while in bloom, 45° should be considered the proper mean night temperature. Let whatever watering may be required be done early in the day, so as to allow advantage to be taken of sunshine, whenever such may occur, to give air for the purpose of drying the foliage, &c. Many persons appear to entertain an opinion that very little attention is needed to properly supply plants with water at this season; and they only look over their stock at intervals of several days. We would, however, caution young gardeners against this mistake, and advise them to examine every plant, at least every other day, deferring the application of water until it is really required, and then giving a liberal soaking. We need not say that specimens which may be placed near heat-yielding surfaces will require water oftener than others occupying a cooler position, and they will be much more liable to suffer from neglect, and hence such should receive particular attention. At any season it is unwise to water a plant lest it should be too dry before next examination, and the way to avoid the temptation to do so is to look over the stock often. Attend daily to the removal of dead or decaying leaves, and directly any of the flowering specimens become shabby, remove them to some out-of-the-way place, taking care that they are put in proper circumstances as to temperature, &c., according to their wants, and supply their places with others in full beauty. Advantage should be taken during the present unfavourable weather for out-door operations to forward in-door work as much as possible, so as to be in a position at the proper time to concentrate all the available force you possess upon such work as cannot now be expeditiously or comfortably executed. Where necessary, the leaves of plants should be sponged over, and thoroughly cleaned, twiners pruned, trimmed, and put into proper order for the spring. Soils, crocks, charcoal, and whatever else may be necessary for potting, should be got into readiness for use when wanted. It will be of service in pulverising soils to be used for potting, and also in destroying insects, to spread them out in an exposed situation, and leave them to become frozen through, but they should not be placed where they will be liable to get wet. Orchid baskets may be made or repaired, also stakes, tallies, &c. COLD PITS.—Where the stock of bedding plants has to be wintered in structures of this description, the present will be found a most trying time, and the utmost vigilance and care will be required to preserve the plants from harm. Apply sufficient covering to the glass, and also to the walls of the pits or frames, to ward off the effects of the most severe frost, and embrace every possible chance of admitting fresh air, and removing decaying leaves, in order to prevent damp and mould. Too little water can hardly be given during the present month to plants in cold frames, and when it becomes necessary to give any, let it be done on the morning of a fine day, freely admitting air afterwards, in order to dry up all superfluous moisture before evening. Plants that may have been covered up for several days should not be suddenly exposed to bright sunshine, but should be partially shaded for a few hours; admitting air in the meantime, if the state of the external atmosphere will admit of it; this will dispel damp, and greatly assist in preventing the injury which might otherwise result from sudden exposure to sunshine. It is, however, neither economical nor judicious to attempt to winter general bedding stock in structures not artificially heated, for under such circumstances, in unfavourable seasons, it is scarcely possible to prevent a considerable loss taking place, and the trifling expense of 2-inch hot-water pipes, is more than repaid by the saving of labour, &c., in covering, which such an arrangement effects. Where the convenience of supplying fire heat is at command, it will still be advisable to cover the glass in frosty nights, and care should be observed not to render the plants tender by an excess of warmth.

FLORISTS' FLOWERS.

Look over beds of Pansies, Pinks, &c., after frost, to see that the plants are not thrown out of the ground. Turn heaps of soil frequently during frost, in order to pulverise and sweeten it. See that the stock of plants in frames does not suffer from the attacks of insects or mildew, and apply tobacco-smoke immediately the former is discovered; and remove infected leaves, and dust with sulphur, to check the progress of the latter. Dahlia roots may now be placed in heat where a large increase is required, but in most cases, if the roots are keeping well, they had better be allowed to remain in the store for another month.

FLOWER GARDEN AND SHRUBBERIES.

While the ground remains in its present frozen state, little can be done in these departments; wheeling may, however, be more expeditiously and cheaply carried on now than when the surface of the ground is soft; hence, where they are wanted, fresh soils or manures should be put upon the flower beds and borders. Shrubberies may also be thinned, where this involves only the cutting out of overgrown plants, or lopping deciduous trees, but where evergreens generally require pruning, that is best done in March; for although, when the winter proves mild, such work may safely be performed at any time, it is never safe to depend upon this. When the hands cannot be profitably employed at out-door work, get a good stock of pegs, Dahlia stakes, tallies, brooms, and such like things prepared and stored away in an orderly manner, so as to be ready for use when wanted.

FORCING DEPARTMENT.

PINERY.—A night temperature of about 60° should be maintained in the fruiting pits, letting it rise to 70° or 75° by day; and, where fruit is swelling, it may be allowed to rise 10° higher with sunshine and air; aim at keeping up a steady bottom heat of about 80°, which for the present will be high enough. Maintain a moist atmosphere, and water such plants as may require it with tepid manure water, but guard against an accumulation of moisture in the heart of such plants as may be showing fruit. In the succession pit the night temperature need not exceed 55° while the present hard weather continues, and from 60° to 65° will be sufficiently high on cold sunless days. See that none of the young stock suffers through dryness at the root, which is apt to be the case where much fire heat is employed. Where there is a convenience for repotting the plants, and re-arranging them without exposing them to cold air, such as require it should be got through hand, taking care to have a supply of properly moist warm soil before commencing the operation. VINERIES.—Wash and dress the Vines in houses about to be started, and prepare materials for covering the outside border, if this is not already done; this, however, should always be effected before this season, so as to retain a portion of the warmth infused by the summer's sun; a substantial covering of dry leaves, fern, or some such material, should be applied before raising the inside temperature, and where it can be obtained these may be mixed with a portion of stable manure, to create a moderate fermentation and infuse a gentle warmth into the border, which will be of great service in promoting a vigorous root action. Care must be observed, however, if heat is once applied to the border, to replace the fermenting materials as they become exhausted, so as to maintain a regular temperature, and prevent the roots sustaining any check. Commence with a night temperature of from 45° to 50°, allowing it to rise some 10° by day. Syringe freely in fine weather, and admit air on every possible opportunity to strengthen the buds, and induce the production of short jointed strong shoots. Bend the Vines so as to place the lower buds in the most favourable position for receiving the sap in its ascent. Where Peaches and Figs, &c., are being started, maintain a night temperature of about 45° or 50° according to the state of the external atmosphere, and see that their roots are properly protected from the effect of frost; but for early forcing, it is greatly preferable to have a stock of plants in pots or boxes, which allows of keeping the roots in a favourable temperature. A small portion of Strawberry plants may now be placed in a pit or frame where the temperature can be kept at about 45°, giving plenty of air whenever the weather will permit, and if the pots can be plunged in a gentle bottom-heat, this will be advantageous in encouraging a healthy root action. Where very early Melons are required, seed should be sown at once. Cucumbers being generally grown for early use, it is scarcely necessary to say anything about them, but if not already done, seeds should be got in.

HARDY FRUIT DEPARTMENT & KITCHEN GARDEN.

Take advantage of the present state of the weather to get manure wheeled upon the quarters for which it may be intended. Cover Celery with dry litter to protect it from frost, and Cauliflower plants under hand-lights, or in frames, should be guarded from damp by admitting air on every favourable opportunity, and a slight protection against frost will be useful, particularly where the plants may not have been properly hardened. Lettuce and Endive in cold pits will require protection from frost, and air to dispel damp whenever this can be given. Attend to keeping up a supply of Seakale, Rhubarb, and Asparagus, &c., according to the demand and convenience, by introducing quantities of the roots into heat at intervals of about a fortnight. Also see to keeping up a supply of French Beans by making frequent sowing under favourable circumstances. These are generally grown in pots placed in Vineries or plant houses, but their liability to the attacks of red spider render them dangerous inmates of such structures, and where it can possibly be done they should be planted in lines in the bed of a pit devoted to their culture.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Jan. 5, 1854, as observed at the Horticultural Gardens.

Dec. and Jan.	Month.	Year.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Of the Air. Min.	Of the Air. Mean	Of the Earth 1 foot deep.	Of the Earth 2 feet deep.	Wind.	Rain.

Dec. 30—Snow-shower, 6 A.M.; great fall of barometer; rain; clear and frosty.
— 31—Very clear and frosty; partially overcast at night.
Jan. 1—Clear and frosty; snowing; clear and frosty.
— 2—Frosty; snowing; clear, with intense frost at night.
— 3—Frosty and foggy; uniformly overcast; sleet at night.
— 4—Snow to the depth of 6—5 inches; uniformly overcast; fall of snow at night.
— 5—Thick haze; uniformly overcast; rain and sleet.
Mean temperature of the week, 9½ deg. below the average.

Errata.—In last week's Table read, mean of 24th, 31; after. min. 18.7; mean of week, 27.3

STATE OF THE WEATHER AT CHISWICK,
During the last 28 years, for the ensuing week, ending Jan. 14, 1854.

January.	Average Highest Temp.	Average Lowest Temp.	Mean Temp.	No. of Years in which it Rained.	Greatest Quantity of Rain.	Prevailing Winds. N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
Sunday 8	39.32	30.53	34.92	7	0.26 in.	3	1	2	0	9	5	4	4
Mon. 9	39.64	31.21	35.42	9	0.20	2	0	6	4	5	5	5	1
Tues. 10	41.53	30.35	35.94	13	0.40	1	3	5	4	3	5	5	2
Wed. 11	41.21	31.67	36.44	16	0.83	0	2	3	2	4	4	6	3
Thurs. 12	41.85	31.00	36.42	12	0.76	2	1	2	1	4	6	5	1
Friday 13	42.78	33.57	38.17	15	0.29	3	4	4	0	3	3	5	3
Satur. 14	42.35	31.25	36.80	15	0.80	4	4	4	0	3	3	5	1

The highest temperature during the above period occurred on the 14th, 1849—therm. 56 deg.; and the lowest on the 14th, 1838—therm. 4 deg.

Notices to Correspondents.

BOOKS: *A. B.* There is no book that we know of that "treats exclusively of rustic work, giving examples of baskets suitable for pleasure-grounds, &c."‡

NAMES OF FRUITS: *Rudolph.* Powell's Russet.‖

NAMES OF PLANTS. We have been so often obliged reluctantly to decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Erzeroum.* 219, Hypericum scabrum;—753, Clematis orientalis —; 416, C. vitalba; 458, Consolida Aconiti; 630, Pæonia paradoxa; 989, Papaver orientale; 153, Papav. armeniacum; 190, Romeria rhœadiflora, *Boiss.*; 638, Delphinium Oliverianum; 298, D. Ajacis; 1018, Anemone apennina.

POTATOES: *D E.* There is no doubt that frozen Potatoes will live if thawed in the dark, unless the temperature has been very unusually low. But we cannot undertake to say that Potatoes sprouted in a pit or shed, and therefore tender, would equally resist cold when suddenly planted out. We should think not.

WELLINGTONIA: *S R F.* The size of the Wellingtonia, as given in the *Chronicle* of Dec. 24, is as reported by Mr. Lobb. That it was over 30 feet in diameter is pretty clear from the number of persons who can be seated in it. We understand that a mounted horseman rode into the interior of a hollow tree that had been blown over, and after proceeding some distance in the interior, turned the horse and rode out again.

WOODS AND FORESTS: *P E.* We are merely waiting in the hope of learning that Government intends to do what is right in the future management of this branch of the public service. Now that the blue book is out it must necessarily come under the consideration of the Cabinet; and we are unwilling to believe that the responsible ministers of the Crown will tolerate the management of the deputy-surveyors and their abettors. Should we be mistaken the exposure must go on, for the subject is of great public interest as well as importance, which we most certainly shall not allow to be burked. If we sought for a personal triumph we should not pause for an hour.

MISC: *H.* Since you have no room in front of your house, a Vine border for late Grapes, formed in the Vinery and extending under and behind the back wall, may be made to answer perfectly. We know of no such plant as Baccella violacia.

PERUVIAN GUANO, the guaranteed import of Messrs. ANTONY GIBBS AND SONS, Lobos Island Guano, Superphosphate of Lime, and all Artificial Manures, Linseed and Rape Cakes, &c.—WM. INGLIS CARNE, 10, Mark Lane, London.

MANURES.—The following Manures are manufactured at Mr. LAWES' Factory, Deptford Creek:—

Turnip Manure	... per ton	£7	0 0
Superphosphate of Lime	"	7	0 0
Sulphuric Acid and Coprolites... ...	"	5	0 0

Office, 69, King William Street, City, London.

N.B.—Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia.—Sulphate of Ammonia, &c.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desirous of receiving instructions in Chemical Analysis and Assaying, will find ample facility and accommodation at the College.

GUTTA PERCHA BOOTS FOR SHEEP, for the Cure and Prevention of FOOT-ROT (price 4*d.*, 5*d.*, and 6*d.* each). Price of the Powder, in tin cases, sufficient for 100 sheep, 2*s.* 6*d.*—Address JOHN JONES and Co., Patent Works, Sheffield. London Agent, Mr. F. HAINES, 22, Lime Street, City.

BIRD NETS, SHEEP NETS, RABBIT NETS, BAT FOLDING NETS with Bamboo Poles, 14 feet long 10*s.* each; Partridge Nets, 2*d.* per square yard; Rabbit Nets, 4 feet wide, 1½*d.* per yard; Cocoa Nut Fibre; Sheep Folding Nets, 4 feet high, 4*d.* and 6*d.* per yard.—At W. CULLINGFORD'S Manufactory, 1, Edmund Terrace, Ball's Pond Road, Islington (late of Strathmore Terrace, Shadwell), London.

GARDEN NETS, FISHING NETS, SHEEP NETS, and RABBIT NETS, made by machinery, and supplied on very low terms. Samples sent free.—R. RICHARDSON, 21, Tonbridge Place, New Road, near King's Cross, London.

"FRIGI DOMO."—Patronised by Professor Lindley for the Royal Horticultural Society, the Royal Zoological Society, by his Grace the Duke of Northumberland at Syon House, and many cultivators of first class Horticultural and Floricultural produce.

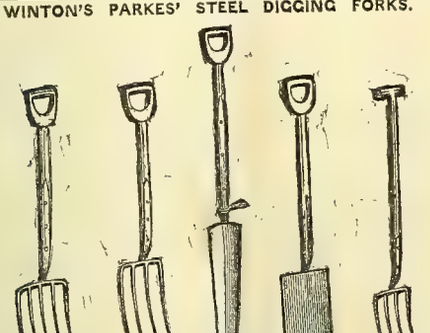
"FRIGI DOMO," a Canvas made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of E. T. ARCHER, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey.

PROTOXIDE ANTI-CORROSION PAINT, at a very considerable reduction of price. This article is extensively used by the principal Railway and Gas Companies, and by Builders and others for painting Stucco. It prevents iron from rusting, wood from decay, masonry from damp, and the hottest sun has no effect upon it.—Manufactured by CHARLES FRANCIS and SONS, Cement Works, Nine Elms, London.

PRIZE CHURN.

ANTHONY'S PATENT AMERICAN.—The Royal Agricultural Society again awarded the prize to this Churn, at their last meeting at Gloucester; at the trial this Churn made 4 lbs. 6 oz. of butter from 4 quarts of cream, the best of the other Churns tried made only 3¾ lbs. from the same quantity and quality of cream; 2000 of these Churns are sold yearly. Copies of testimonials, and list of prices sent on application.—BURGESS & KEY, Agricultural Implement Warehouses, 103, Newgate Street, and 52, Little Britain, London.

WINTON'S PARKES' STEEL DIGGING FORKS.



I HEREBY GIVE NOTICE that the Steel Digging Forks hitherto sold by Messrs. Winton & Son, of Birmingham, and called by them "Winton's Parkes' Forks," were manufactured by me, or by my direction, for the said Messrs. Winton & Son, and that I have now discontinued to manufacture for them; and that I have appointed Messrs. BURGESS & KEY, of 103, Newgate Street, London, my wholesale Agents, to whom I respectfully request orders to be addressed.
29th Sept., 1853. Signed, FRANCIS PARKES.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

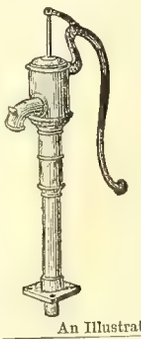
The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

WARNER'S PATENT FARM AND COTTAGE PUMPS.



Cast-iron Pumps for the use of Farms Cottages, Manure Tanks, and Shallow Wells.

	£	s.	d
Patent Pump	1	15	0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3	0	0

Larger sizes if required.

The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

JOHN WARNER & SONS,

8, CRESCENT, JEWIN STREET, LONDON.

Every description of Machinery for Raising Water; Fire Engines, &c.

An Illustrated Book sent on application post free.

LAND DRAINAGE.

MR. BAILEY DENTON'S TABLES OF COST, &c., price 1*s.* 4*d.* Sold by METCHIM, Parliament Street.
MR. BAILEY DENTON'S WORKMAN'S A LEVEL, price 1*l.* 10*s.* Sold by JONES & Co., High Holborn, London.

DRAINAGE AND IRRIGATION.

HENRY WEBBER begs to inform Landowners and the Public, that having had several years' practical experience, he is prepared to undertake the Drainage and Irrigation of Estates upon the most improved principles, either by Contract or on Commission. Reference given.

H. W. wishes particularly to call attention to his improved and inexpensive method of Irrigation, whereby, at an outlay of a few pounds an acre, he can convert land having a sufficient quantity of water at command into water meadow, which may be mown every year without the application of manure. Any further information will be given on application.—Halberton Court, near Tiverton, Devon.

WEIR'S DRAINING LEVEL, PRICE 30*s.*

These Draining Levels have lately been greatly improved; they have stood the test of five years' use, during which upwards of 1000 of them have been sold. They are so simple that any labourer who can read can use them. They require no graduated staff, the index telling at once the rise and fall in inches without any computation.

EDWARD WEIR, Agricultural Engineer, 16, Bath Place, New Road, (6 Doors West of the Hampstead Road), Removed from Oxford Street.

NEW FOREST.
TO LAND DRAINERS.
BY ORDER OF THE COMMISSIONER IN CHARGE OF HER MAJESTY'S WOODS AND ROYAL FORESTS.

NOTICE is hereby given that Tenders at per rod are required for Under-Draining with Pipes and Collars about 93 Acres of Land on New Park Farm, three miles from Lyndhurst, and 1½ mile from Brockenhurst, in the New Forest.

The supply of pipes and collars to be drawn from the Victoria Tilery in the New Forest, from 2½ to three miles distant from the land to be drained.

Plans, Specifications, and Particulars of the Drainage, and of the price at which pipes can be obtained at the Victoria Tilery, may be seen on application to Mr. L. H. Cumberbatch, at the Queen's House, Lyndhurst, Hants.

Persons tendering are required to state their qualifications for the undertaking, and will be required to be bound themselves in the sum of 100*l.* and two sureties in the sum of 50*l.* each for the due performance of their contract to the satisfaction of Mr. L. H. Cumberbatch, the Deputy Surveyor of the New Forest, and Mr. William Dickinson, the lessee of New Park Farm.

Sealed tenders, to be headed "Tender for New Park Drainage," will be received by the Right Hon. T. F. KENNEDY, Office of Woods, &c., 2, Whitehall Place, London, until 12 o'clock at noon on Friday, the 13th of January, 1854.

The lowest tender will not necessarily be accepted.

TO LANDOWNERS, SOLICITORS, ESTATE AGENTS, ETC.

THE LANDS IMPROVEMENT COMPANY, incorporated by special Act of Parliament, 1853, having perfected their organisation, are prepared to receive applications for the execution of improvements, under the provisions of their Act.

The Act extends to England, Wales, and Scotland; and empowers persons in the actual possession of lands, or in receipt of the rents, such as tenants for life, trustees, bodies corporate, incumbents of benefices, mortgagees in possession, guardians of infants, &c., to effect substantial improvements on their estates, and to convert the outlay on such improvements into a terminable annuity or rent-charge of from 14 to 25 years, at will.

The Company, acting under the supervision of the Inclosure Commissioners, will undertake and execute improvements, or will supply the capital to landowners preferring to execute improvements themselves, or will grant the powers of their Act to landowners seeking merely to charge the inheritance with the outlay on improvements.

The Agricultural Works of Improvement particularly specified in the Company's Act, are:—

1. The Drainage of any Lands by any such means as the Inclosure Commissioners shall approve.
2. Irrigation, and Warping of Lands.
3. Embanking of Land from the Sea, or Tidal Waters, or Rivers, in a permanent manner.
4. Enclosing or Improving the Drains, Streams, or Watercourses of the Land, under the Inclosure Commissioners.
5. Reclamation of Land lying waste.
6. Making Farm-roads to the extent of one-half of the outlay for such roads.
7. Clearing Lands.
8. Erection of Farm-houses, and other Buildings required for farm purposes to the extent of three-fourths of the outlay for such Farm-houses and other Buildings.

In effecting the above Improvements there may be erected any Engines, Machinery, Engine-houses, Mills, Kilns, Sheds, Yards, Shafts, Tanks, and Reservoirs, Pipes, Conduits, and Watercourses for Irrigation, Tram-roads and other ways, Bridges, Weirs, Sluices, Flood-gates, and Hatches.

For Forms of Application and further Information apply to the Hon. W. NAPIER, Managing Director, 2, Old Palace Yard, Westminster, London.

BAKER'S FOUNTAINS.
THE PHEASANTRY, BEAUFORT STREET, KING'S ROAD, CHELSEA.

MESSRS. BAKER can confidently recommend their FOUNTAINS for Poultry, Pheasants, Pigeons, &c., as the most simple, efficient, and economical; they are easily filled, no screw or plug required. Price, containing 4 quarts, 6*s.*; 9 quarts, 8*s.* And at 3, Half-moon Passage, Gracechurch Street.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL AND GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

THE LABORATORY OF THE ROYAL POLYTECHNIC INSTITUTION is always open for the reception of pupils, under J. H. Pepper, Esq., F.C.S., A.C.E., &c. Careful Analyses and Assays of Soils, Minerals, Waters, Mercantile or Agricultural Products are performed with despatch, accuracy, and economy.

For terms apply to Mr. R. J. LONGBOTTOM, Secretary.

MANCHESTER POULTRY EXHIBITION.—An Exhibition will be held in the Free Trade Hall, on the 24th and 25th of January, the entries must be made with the Secretary on or before the 10th of January; the entrance money must be paid before pens can be entered for competition. One Hundred and Fifty Pounds will be given in Prizes; Poultry not in the Prize List can be Exhibited as Extra Stock. The judges will be instructed to award prizes to such as they consider deserving.—For further particulars, see Regulations and Prize List, to be had from the Honorary Secretary, Mr. GEORGE POTTER, 13, Cooper Street, Manchester.

THE GREAT METROPOLITAN EXHIBITION of POULTRY, PIGEONS, and RABBITS, will take place at the Bazaar, Baker Street and King Street, Portman Square, on Tuesday, the 10th, Wednesday, the 11th, Thursday, the 12th, and Friday, the 13th of January, 1854. Admission—Tuesday 2*s.* 6*d.*, Wednesday, Thursday, and Friday, 1*s.* each day.

The Agricultural Gazette.

SATURDAY, JANUARY 7, 1854.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

THURSDAY, Jan. 12—Agricultural Imp. Society of Ireland.
THURSDAY, — 19—Agricultural Imp. Society of Ireland.

A HARD CONTINUED old-fashioned Frost—a frost that men of all ages of life declare 'reminds them of their boyhood,' has brought in the new year radiant with promise to the farmer of a cycle of more propitious seasons than he has of late for several years experienced. But mankind are not all farmers, nor the most inveterate farmers always on the farming topic; and viewed in other than the agricultural light, what a year has just opened upon us! Men verging on middle life are too young to realise the features that lower over the coming twelvemonth—and who shall say how many more?—with the prospect of another European and more than European war. It would not be easy to exaggerate the consequences that stand threateningly poised upon the moment when we have just turned from the old to the new year; a moment from which the view spreads back over nearly forty years of a Peace that had antiquated the very name of War amongst civilised countries, while before it lies an embroilment spreading like an Eastern pestilence, and enveloping nation after nation in its progress. It is impossible at a moment of suspense so circumstanced as that which this opening year brings with it not to feel a temporary lull of interest in every other less exciting topic, and to reflect with wonder on the mysterious power of evil to intercept and check the progress of good, and to compel even Peace to arm itself for Justice, to plunge into a calamitous struggle, after every unavailing effort to avert it, and to encounter a future whose probable vicissitudes baffle all foresight and conjecture.

And yet how full of instructive contrast to turn from the grievous and bewildering view of warlike preparation with all its grand deformity and moral falsehood, to the peaceful and truthful beauty of that eternal art whose noblest boast and destiny are written in its undying antagonism to the sword. How fortunate the destiny of a people who *can* turn from the contemplation of War, as from a foreign thing at worst and at all times, and pursue the uninterrupted work of cultivation upon fields ploughed without cannon and manured without blood. Truly there lies a rich moral in the anecdote of the Warwickshire ploughman who, on hearing the bells ringing for the Victory of Waterloo, and the final close of our long three-and-twenty years' struggle by the Proclamation of Peace in 1815, enquired with honest wonderment and scratching of the head—"What 'av' 'em bin a-*warring* then?"

In a recent Number of 'Chambers's Edinburgh Journal' there appeared an interesting article, which must have attracted some share of general notice and perusal, by the happy, though not quite new character of its heading. The words 'Approaching Revolution in Agriculture' contain a charm which operates alike on every eye, and is as irresistible now as it was a century ago, and will, perhaps, remain the same when other centuries have passed away. There are some, it is true, to whose faces it will

bring a smile—the smile with which men recognise an old visitor whom experience has made familiar, without any great change for the better or the worse by his accustomed visits: but compared with the mass of expectants and lookers on, the number of these graduates is small. The great majority of us have a tolerably keen and credulous appetite for a 'revolution' every now and then, in most of the arts of life that own dependence on the progress of scientific discovery; and in none is this instinct or illusion, whichever it may be, more perceptible or more permanently fresh than in agriculture.

In the article above referred to, some disappointment perhaps awaited the agricultural reader, on discovering that the 'revolution' indicated was *only* a chemical one; that it chiefly related to the organic constituents of the atmosphere, the absorption of carbon and ammonia by the earth and its growing products, with an allusion to SCHLEIDEN'S researches into the phenomena of vegetation, and to the discovery of 'interstitial currents' in the soil, by Professor BAUDRIMONT, of Bourdeaux, subjects of deep interest, but, with the exception of the last, not unfamiliar as matter of study and experiment to the agriculturists of this country.

The word revolution, however, has begun of late to bear relation to a different branch—to the mechanics rather than the chemistry of farming; and, indifferently circumstanced as parts of this country are for the growth of cereal crops, by soil and climate, whilst especially favoured in all the elements of mechanical capability, the reflection is likely to increase that in that direction lies the task which—more than ever in the present state of the labour market—presents claims upon our attention and ingenuity almost of an exclusive and national complexion. The advancement in the knowledge of agricultural chemistry amongst us during the last ten years has, in the aggregate, been great; but from the very nature of such knowledge, its direct application to practical use is necessarily gradual, and obscure to the eye, being absorbed in the generally improved practices of the field, and existing rather as a mental guide to the farmer than a matter for innovation or display. Its effect is rather to assimilate general practice to the standard of the best examples already existing, which the chemist after all does but approve and explain, than to produce startling deviations or unlooked-for results. The best of all revolutions are those which so proceed; but where they do so proceed they afford safe assurance against any sudden revolution of practice derived from fresh discovery; like the lightning-conductor, they draw away in detail the force of the shock which advancing knowledge may direct against the prevalence of erroneous practice; and it is only seen, by looking back over past periods of some duration, what that effect is, both in nature and amount, which the gradual spread of true principles of practice (commonly abbreviated into the term science) actually produces upon the husbandry of the age.

It does not appear why more than this should ever have been looked for from agricultural chemistry. The instinct of practice, in dealing with the elements and everyday phenomena of nature, in a business so old and so universal as husbandry, might well be expected to have discounted, in course of time, the most ingenious discoveries of modern chemistry; and when the best chemists of our day have themselves, from time to time, acknowledged this in admitting that chemical truth is most happily illustrated by the results of the best practice—one does not see what more there is to be said upon the question: what you seek is not so much the establishment of something hitherto unknown, as the diffusion of the known, with the *rationale* appended to it that shall explain and commend it to an inquiring mind and prove it to a doubting one.

But in the mechanics of the art the case is different. If in any region of the earth, at any time, a man might, in course of practice, hit upon a succession of crops, a mode of mixing and applying his manures, and a sagacity in the exposure of his soil to the influences of the atmosphere that would answer the best requisitions of modern science, yet all that practice could ever do for the mechanics of husbandry would be to gradually develope and improve the instruments best suited to the capabilities of the hand or of the team, the only agents of field tillage that, till recently, existed.

But not so now. The agency of Steam bound by no vassalage to the two modes of tillage prescribed by the nature and necessities of manual or of horse-labour, as instanced in the spade and the plough, does seem to promise a revolution not less (and it need not be greater) than that it has achieved in almost every other process of art it has yet been applied to; in obedience to that feature so happily phrased by Professor Sir A. ALISON as "the almost miraculous multiplication it has produced of the *powers of mechanical invention*."—"When we contemplate the effect of the steam-engine on machinery," continues that historian "and the conducting of nearly all the branches of manufacturing industry, as it has been exemplified in Great Britain for the last eighty years, we seem to have been *entering on a career to which imagination itself can assign no limit*."

Powerfully true. But what will the surprised reader say, then, to the 'limit assigned to its career by the *imagination*' of the same distinguished writer, in the very next paragraph, which proceeds as follows:—

"Great as are the things which the steam-engine has done for mankind, it may be doubted whether what it has left undone are not still more important to human happiness and the moral purity of the species. Its marvels are confined to manufacturing industry;—it is incapable of application to the cultivation of the soil. It enables one man to do the work of 200 in providing dress or luxuries, but it has not superseded even the hand of infancy or old age in furnishing the means of subsistence. Behold that boy who tends his flock on the turf-clad mountain brow, he is as ignorant of art as his predecessors were in the valleys of Arcadia; but will the steam-engine ever encroach on his blessed domain? Listen to the song of the milk-maid, as she trips along yon grassy mead—is that gladsome note to become silent in the progress of civilisation? Observe that old man who is delving the garden behind his cottage; the feebleness of age marks his step, the weakness of time has all but paralysed his arms—yet art, in all its glory, will not equal his labour in the production of food for man. Cast your eyes on that orchard, which is loaded with the choicest fruit of autumn—on that sunny slope, which seems to groan under the riches of the vintage—on that garden, which realises all that the soul of MILTON has figured of the charms of Paradise—and say, will these primeval and delightful scenes ever, in the march of improvement, be lost to mankind? The powers of steam, the inventions of mechanism, the division of labour, have done wonders in all the branches of handicraft and art; but they have left untouched the marriage of Industry with Nature in the fields. And in the last days of mankind, as in the first, it is in the garden of Eden that man is to find his earthly paradise."

There is no replying to poetry of the 'Deserted Village' school: no arraigning the 'limits that imagination may set to a career' it had just pronounced illimitable in every sphere where trial had been practically made, followed by a *de facto* negation of it to one where no trial can be said to have been made as yet, worthy of the name of serious experiment. But is it *true* that steam has been proved inapplicable to agricultural purposes, and "has not superseded the arm of infancy or old age in furnishing the means of subsistence?"—'Behold, then, that middle-aged individual serenely thrashing in a barn! listen to the alternate rhythm of the Flail as it glances through the air and 'lights resilient upon the dancing corn-sheaf; is that gladsome sound to become silent in the progress of dispurifying vaporotrition?—will the steam-engine ever encroach on the blessed domain of the barn-door: and the fattening cottage pig be robbed of his evening meal, poured from recondite under-smock and miraculously furnished wallet?'

Or, to change the venue but a very little way back—'Cast your eyes on that stage-coach, which is loaded inside and out, and seems to groan under a *testudo* of umbrellas and pea-jackets; "please to remember the coachee," who sips the vintage at each road-side inn, "and that in every stage," and the guard, who realises all that the soul of MILTON has figured of LUCIFER going to and fro upon the earth, and say, will these primeval and delightful scenes ever, in the march of improvement, be lost to mankind?'

Alas! yes: the demoralising Steam-engine has erst invaded the moral purity of the Stable, and eke of the Farm-yard, after seventy years' negation to the former and eighty to the latter, from the date of its first infliction upon the degenerate wants and uses of mankind. And in spite of all the picturesque sentiment that appeals to prejudice it might be employed to enlighten and correct, and in defiance of all the pleasant poetry that leaves in the lurch, unproven and untouched, the thesis it was summoned to illustrate, and regardless of the one-eyed philosophy that ascribes illimitability to what it has seen and impossibility to what it has not seen; the steam-engine which has fought its way into the Farm-yard may yet fight its way out of it, to the arable land; and yet the sunny slopes and orchards, and cottage gardens and grassy meads, and tripping milk-maids of the country be as charming as before, and great historians be able to 'babble of green fields,' while binding and loosing at pleasure "the marriage of Industry with Nature" in field and factory; sinking History into an old almanack, by quenching its most useful and truly glorious rays—not those which stare and dwell upon the acknowledged marvels of the Past, but those which penetrate and illumine 'the ignorant Present time, and reflect the Future in the instant.'

THE Tables, in another page, of the measured and actual weights* of the live stock shown at Baker Street deserve attention. Our columns are so full, and so many communications from valued correspondents are waiting publication, that we can merely name the facts they seem to convey.

And, first, of what they teach about the three different breeds exhibited, the following Table is sufficiently instructive. The averages stated are taken from those in page 827 of last year's volume; the weights given are therefore only estimates, but they have proved in all cases below the truth, and for comparison may be trusted.

	Devons.			Herefords.			Short-horns.		
	No.	Age.	Weight.	No.	Age.	Weight.	No.	Age.	Weight.
	hd.	yrs. mo.	st.	hd.	yrs. mo.	st.	hd.	yrs. mo.	st.
Oxen ...	7	2 9½	68	5	2 10	73	8	2 9	84
Ditto ...	9	4 4	78	12	4 0	98	14	4 2	106
Heifers ...	4	3 9	66	2	3 1	64	7	3 5	85
Cows ...	4	8 8	69	1	5 1	72	14	7 4	90

The two first lines are the most significant, indicating, we think, among other things, the earlier maturity and greater weight of the short-horn breed, and so far as this goes (for it is not all that is required to determine the problem, the quantity of food consumed would be needed too), pointing out the short-horn as the best farmer's beast of the three.

As to which is the best butcher's beast the following may tell.

Thirteen Devon cattle weighed 1085½ stone, and yielded 143½ stone of loose fat, or 13.2 per cent. of their carcase weight.

Twelve Hereford cattle weighed 1128½ stone, and yielded 130 stone of loose fat, or 11.5 per cent. of their carcase weight.

Nineteen short-horn cattle weighed 1960 stone, and contained 213 stone of loose fat, or 10.8 per cent. of their carcase weight. These figures are perfectly consistent with the general idea that the Devon and Hereford cattle "die" better for the butcher than the short-horn. And if we confine our attention only to the young and prime beef the same truth is still more apparent. Thus nine Devon oxen and three Devon heifers, aver ging 3 years 8 months, weighed 995 stone, and yielded 131½ stone of loose fat, or 13.1 per cent. of their carcase weight. Twelve Hereford oxen, averaging 3 years 8 months, weighed 1128½ stone, and yielded 130 stone of loose fat, or 11.5 per cent. f their carcase weight. Sixteen short-horn oxen and one short-horn heifer, averaging 3 years 6½ months, weighed 1688 stone, and contained 177 stone of loose fat, or only 10.5 per cent. of their carcase weight. Probably the numbers compared are not sufficient to give very trustworthy results, still it is worthy of remark that they tally with the general idea on the subject.

The second point illustrated in these tables is the capability of estimating the weights of cattle by their measurements. But to this, and to the relative *merits* of the two cattle guages employed in working out these results, we must refer next week.

Meanwhile we conclude with a question. How comes it that so many pure-bred short-horn heifers find a place in the catalogues of our fat cattle shows? How comes it that animals with most valuable pedigrees find their way to the butcher at so early an age? The answer is to be found in the excessive feeding by which breeding stock is so often injured. Well might Mr. PUSEY say at the annual meeting of the Farmers' Club, that for his part he could see but little difference between the show yards of July and December. Much of the responsibility of this destruction of valuable stock rests upon those whose competitions encourage, if they do not sanction this treatment of our breeding stock. How comes it, for instance, that Mr. AMBLER'S pure-bred white short-horn heifer competes for prizes at Baker Street and Birmingham, and is slaughtered at three years old, whilst her dam, now 14 years old, has been a regular breeder, and has had a calf within the past four months? The answer is—*She once tried for the premium of the Royal Agricultural Society of England.*

ROOT-GRATING MACHINE.

"*A. Z.*—We do not know what you refer to, but we are quite sure that no one with a regard to his own respectability will advertise his ability, by means of it or any other such contrivance, 'to effect a saving of 50 per cent. in feeding cattle.'"—*Agricultural Gazette, No. 47.*

The above paragraph was cut out of your Paper and forwarded to me from Scotland. I never made the

* We beg to return our best thanks to those who have kindly answered our application for information as to weights, &c., of cattle sold at Baker Street.

assertion which you quote on feeding cattle; but, at the same time, I think it very likely to be the case. Any contrivance which teaches a farmer to economise his fodder must be beneficial to him, and I believe the art lies in fermentation. The large carters in the south of England are fed upon Barley, but it is fermented before it is given to them. A friend of mine had a lot of very fine Cochin China fowl; he fed them on raw Barley, in a fermented state, and, as he stated to me, it is very good food for them.

In the experiment brought forward in the pamphlet of which I send you a copy, and which was made with the greatest precision and care, pigs alone are mentioned. It shows that 48 cwt. of Turnips fermented, of themselves obtained the object better than 97 cwt. steamed, besides the consumption of 20 cwt. of coal, and the trouble. In another experiment by Sir John Power, who feeds a great quantity of pigs, and is anxious to find out the most economical way of doing so, he writes:—"I selected 12 of my own pigs, and divided them into two lots, as equal as I could, and gave your steward in the county of Kilkenny six to feed for me on the fermented food, and I laid him a wager that I would beat him on the steamed Turnips, both parties being bound to use an equal quantity of cracked Barley." In his letter to me he further states, "the only thing certain as yet is that my lot consumes double the quantity of Turnips."

This is the only answer I make to your paragraph.

Dr. Barter, who is proprietor of the patent in conjunction with my brother, and who is a very large farmer, was here last week. I told him of the opposition there seemed to be to the system in Scotland; his answer was, "So there will be until it is tried."

The call for the root-graters in this country is extraordinary, and it has been found quite impossible as yet to meet the demand.

For cattle, the idea consists in the admixture of the shreds of Turnips, very thin, with farinaceous food; and the reason why I think it probable that it may prove a saving of 50 per cent. is that straw, and rough stuff of all sorts, otherwise rejected by animals, become, when chaffed and so cooked, grateful to them. In this country it seems applied to the feeding of all animals, from fowls to bullocks, and even some go so far as to say dogs, although I cannot say that I have so tried it. It certainly seems admirable for farm-horses; one-third Carrots, two-thirds Turnips, mixed up with chaff, with one feed of Oats in the morning, keep mine in good condition. For my other horses (hunters excepted) their daily rations are—7 lbs. of crushed Oats; 7 lbs. of shredded Turnips or Carrots; 10 lbs. of chaffed hay and straw, with a very small lock of hay in the rack. They stand upon sawdust, upon which I find horses lie down much more during the day, and therefore consider it as agreeable to them as the straw, all which they eat.

I have no share in the patent, but wish to assist my brother's invention. *Gervase Bushe, Glencairn Abbey, Lismore, Ireland.*

* In every case imperial weights and measures are and will be used.

PURPOSES OF AMMONIA IN VEGETABLE ECONOMY.

In the *Gardeners' Chronicle* of the 10th of January, 1852, you gave place to a communication from me on the "Use and Purposes of Ammonia in Vegetable Economy," in which I attempted to show, contrary to the general opinion, that the universal appetence of plants for ammonia was due to their requirements for the hydrogen of the ammonia, to form or build up their structural substance, in conjunction with carbon, derived from the carbonic acid of the atmosphere and other sources; and that their demand for nitrogen, the other constituent of ammonia, was only of a partial and limited character, varying very much in different plants, and shown in the fact of plants giving out nitrogen, in other words, rejecting it; just as they give out, or reject, much of the oxygen of carbonic acid, because they have no use for it, and cannot appropriate or assimilate it.

Will you permit me to resume the subject in a few additional observations, by asking—Of what is the general substance or fabric of plants, their roots, stem, branches, leaves, composed, omitting at present any reference to the mineral or other matters, which enter in smaller quantities into the composition of plants? Is it not hydro-carbonaceous matter, or matter formed by the union or combination of carbon and hydrogen, derived from substances taken in by their roots and leaves? It is, I believe, generally allowed that the carbon is derived from carbonic acid, which is always found in the atmosphere, and produced from decaying vegetable matter in the ground; but whence is the hydrogen derived? It will be said, that it is derived from the de-oxydation or decomposition of water, effected in or by the leaves, under the agency of sunlight and heat. Admitting that this explanation at first sight appears feasible enough, it still occurs to ask, whether there is any direct proof of such decomposition of water taking place. The circumstance of plants giving out oxygen is of itself no such proof; inasmuch as we know that oxygen, given out by plants, is also derived from carbonic acid. In what other way then can it be proved? But further, we also know that ammonia is greedily absorbed by plants, and they flourish and expand amazingly in bulk on a liberal supply of it. What becomes of the hydrogen which enters into the composition of all the ammonia, that has contributed so largely to the bulk and substance of the plants? Is there any proof that hydrogen is given out by plants; and if not, in what way is it disposed of? Here, then, are two things, which they who maintain that the hydrogen of vegetable matter is derived from the de-oxydation of water should undertake to show; 1st. That as much oxygen is given out by plants as existed in the water and carbonic acid, from which their hydro-carbonaceous matter is supposed to be derived. 2d. What becomes of the hydrogen of the ammonia absorbed by plants, and how it is that a liberal application of ammonia to plants so greatly enlarges the bulk and mass of their hydro-carbonaceous fabric.

Let me offer an illustration, from which a twofold observation may be deduced, in support of the view I am advocating. Here is a field of Wheat, which grain I select, as it is known to contain a considerable portion of nitrogenous matter; a certain number of square yards at the side of the gate had some months previous to the sowing of the Wheat been occupied by a large heap of manure, carted from the farmstead, which was subsequently applied to the land. Throughout the growth of the Wheat, the plants on this small portion of the field exhibit an extraordinary luxuriance, and ultimately finish their course by being laid, through their own excessive rankness, without producing any grain, while the remainder proceed to maturity in the usual way. Two remarks here present themselves: 1st, The non-formation of nitrogenous products, notwithstanding, and even in consequence of, the excessive amount of ammonia in the ground. Though saturated to richness with it, the only result is, not an increased amount of nitrogenous products, but an excessive development and increase of the hydro-carbonaceous matter of the roots, stems, and leaves of the plants. How is this reconcilable with supposing that the avidity of plants for ammonia and their luxuriance of growth from its liberal application is due to the nitrogen it contains? 2d. The amount of hydro-carbonaceous matter, produced on the piece of ground saturated with ammonia from the manure heap, is greatly in excess of that produced on a similar area of any other part of the field. But, if plants derive their hydrogen from the de-oxydation of water, why should there be this difference? The plants were respectively placed in precisely similar conditions, in relation to light, heat, and moisture, in whatever form; and so they were also in relation to their supplies of carbon from the atmosphere, and probably from the ground; and they should therefore have eliminated from these sources an equal amount of hydro-carbonaceous matter. The difference, I conceive, is incapable of satisfactory solution on such a view; besides that, it is palpable to common observation and experience that ammonia supplied to plants through their roots does in some way or other exert a powerful effect in largely increasing the hydro-carbonaceous matter of their structural substance—their roots, stems, and leaves.

On the supposition that the primary use and purpose of ammonia in vegetable economy are to supply hydrogen to enable them to perfect their substance, the fact of their extraordinary expansion and growth under a liberal application of it is susceptible of an easy and consistent explanation, which may be thus stated. Apart from whatever carbon may exist in the ground in a state fit for the use of plants, there is an inexhaustible supply of carbonic acid in the atmosphere from which the carbonaceous element of their structural substance may be obtained. Practically it is inexhaustible, for the researches of chemists have shown that after all the demand made on this fund by vegetation over the whole world, there is a constant though small and unvarying quantity of carbonic acid at all times existing in, and equally diffused through, the atmosphere. If then the substance of plants were simply carbon, there seems no reason why, from this source alone, they might not attain the fullest development they are susceptible of; but as they consist not of carbon alone, but of carbon united with hydrogen or hydro-carbonaceous matter, they require a proportionately ample supply of the latter element, in conjunction with an already provided and inexhaustible magazine of carbon, to enable them to attain the largest dimensions their structure is capable of reaching. In regard to the first of these two elements of vegetable structure, carbon, plants are at all times and in all situations favourably circumstanced for attaining their full development and expansion by the constant presence of an unstinted supply of carbonic acid in the atmosphere. But they are not always in a position to make the most of this condition, from the more or less partial absence of a suitable proportion of hydrogen to unite with the carbon in forming vegetable substance; and hence the different degrees of luxuriance which characterise vegetation in different situations and circumstances. The ammonia which is to furnish the hydrogen neither exists in the same abundant quantity in the atmosphere as carbonic acid, nor, as far as we know, is it available by plants in that state; it is only as it is brought down dissolved in rain, at distant and uncertain intervals of time, that it can be appropriated by plants through their roots. Limited and variable as is this source of supply, it is the only one that partakes of the character of general or universal in being equally accessible to all plants. If, however, they had nothing else to depend upon, it would be impossible that they should exhibit any remarkable luxuriance of growth, though all the while their leaves were bathed in an atmosphere rich in carbonic acid. But there is also a large, though most unequally distributed, amount of ammonia produced from decomposing animal and vegetable substances brought into the soil by natural or

contingent causes, or by the intentional arrangements of man, which, according as it is more or less abundant in any portion of ground, gives the character of luxuriance or otherwise to the vegetation growing on it by the amount of hydrogen it furnishes for the formation of vegetable substance. The abundance of decomposing matter in the soil, and consequent generation of ammonia, induces in plants luxuriance of growth and enlargement of structure; a comparative deficiency on the other hand is marked by more meagre growth and less ample development, the difference being due to the amount of hydrogen respectively furnished for the formation of vegetable structure. In both cases there is the same unfailing and universally diffused supply of carbon in the atmosphere equally at command; but the plants cannot equally appropriate it, from the different conditions affecting their obtaining hydrogen to assist in the elaboration of their substance.

This subject is not one of mere barren speculation, but of practical importance, for, if the view I have taken be in the main correct, it both explains the action of ammoniacal manures (often erroneously, I think, termed nitrogenous, as if nitrogen was the only important element in them), in enlarging vegetable structure, and shows in what cases their liberal application will be most serviceable. Thus, whenever the desired product is enlargement, or increase of vegetable substance, either in roots, stones, or leaves, a beneficial result may be anticipated from the liberal use of ammoniacal manures; and I apprehend this conclusion corresponds with the results of experience in what are called green crops. But it is otherwise when farinaceous seeds, fruits, tubers, &c, of which starch and sugar form a material part, are the desired products; then a more reserved and cautious use of ammonia is pointed out. There should be enough to produce healthy and vigorous growth, without inducing over-luxuriance or rankness, which is unfavourable to reproductive development, and may even entirely prevent it, the energies of the plant being wholly diverted to the increase and enlargement of its structural substance, by the presence of an excessive amount of hydrogenous matter. As carbon is the basis of starch and saccharine matter, which abound in farinaceous seeds, tubers, and fruits, the state in which organic manures will be most serviceable for their production will be, not when they are rank and fresh, but after a portion of their ammonia has been volatilised or dissipated, and the remainder has become fixed, and when the carbonaceous part of the manure has also been reduced to a state suitable for being made use of by the plants; or, to express it in more general terms, organic manures will be most serviceable for the development of these products, when the activity of the ammoniacal or hydrogenous element is moderated, and the carbonaceous brought into action, by more perfect decomposition. *J. H. H.*

Home Correspondence.

Does Live Stock Pay?—I shall consider that I have done some service to the cause of scientific as well as practical agriculture, by the fact of my analysis, under the above title, of Mr. M'Culloch's Report, having called forth the very valuable and instructive paper on "The Profitableness of Cattle-feeding," by "Y.," in a late Paper. The light he throws on the quantity and value of manure produced by stall-fed beasts, is a great help towards the elucidation of one of the hitherto almost unknown points of agricultural practice. On money results he does not give details: but had he done so, they could not be a criterion on that part of the subject, for he is, by his own statement, so favourably located that he can sell in a dear market at his door, and buy in a cheap one not far off. A very small proportion of the agriculturists of Great Britain are so placed. The feeders of Norfolk, and Lincoln, and Aberdeen, and many another county, will re-echo my assertion that "lean stock costs as much or more per stone than when fattened." Another correspondent "Aliquis," p. 828, also takes up my analysis; and reviewing the reviewer, examines the subject of the value of manure in detail, and proves, doubtless to his own satisfaction (and I quite anticipate that his discovery will be well trumpeted forth, that Mr. M'Culloch's report shows a production of manure containing "8955.6 lbs. of ammonia, which, at 6*d.* per lb. is worth 223*l.* 17*s.* 9*d.*, at the cost, according to 'S.,' of 158*l.* 5*s.* 5*d.*, making the profit on the transaction 65*l.* 12*s.* 4*d.*" I am not unwilling to take his criterion of ammonia as a standard of value; in fact, I myself had suggested it when endeavouring to elucidate the question; but the ammonia contained in a large dunghill is not of the same value as when concentrated in a portable manure. The cost of carriage and expense of handling and spreading would surely have to be deducted, which at 1*s.* 6*d.* per ton on 270 tons (the quantity of manure that, judging by "Y.'s" experience, would be produced), would make a deduction of 20*l.* 5*s.*, leaving, taking "Aliquis'" figures as quite correct, a profit of only 45*l.* 7*s.* 4*d.* But "Aliquis'" figures are not correct. In his calculation of nitrogen in the Bean-meal he makes a mistake of 5367 lbs!! Converting this into ammonia (with his own deduction of 10 per cent. waste) we have 5867 lbs., which, at 6*d.* per lb., is 146*l.* 13*s.* 6*d.*; deduct apparent balance per last paragraph, 45*l.* 7*s.* 4*d.*; leaving a loss on the whole result of 101*l.* 6*s.* 2*d.*, after the manure has been valued by a mode "that does not seem to be so liable to objection" to "Aliquis" as was that adopted by *S.*

Draining across the Fall.—Much has been said in favour of cutting drains across or obliquely to the fall, with a view of intercepting the water in its descent from the higher to the lower ground, as if water in the soil lay in a sheet on a plain, and flowed as it does after rain off an undrained surface, and drains underground could be cut and made like gutters to catch the water off the upper side, and carry it away without any escaping on the lower side. Were the facts really as are here assumed, still to make such drains effective we must further suppose the water to lie at an uniform depth, that the drains may with certainty be cut to and placed across the line of water, so that none may escape into the lower ground, or the land below the drains will be little the drier for the drains above. These conditions, each and all, appear to me essential to the success of cross draining, and yet in practice I believe not one is ever found to exist, and every attempt that I have ever known to drain out of the line of greatest fall has been imperfect, because, as Mr. Bailey Denton has well expressed it, "The course of water will always be governed by ordinary laws of gravity, and in its descent will take the line of greatest inclination open to it;" and cross drains can never present as great an inclination as the natural channels afford, whilst upright drains will offer a greater fall, whether the water lie in fissures, pits, or on a plain; and their direction be any other than in line straight down the fall. Many of your readers will be familiar with the failure of ditches, cut across the hill-side for the purpose of carrying off the water from above, in laying the land below drier. Here we have the ditch intercepting the water, and the water flowing in a way it is impossible to suppose can be the case underground, and yet they not only fail to drain the ground below, but are often the cause of much mischief to it. The level of the water in the ditch may often be traced on the land below by its oozing to the surface, and by the ground being kept wet all the time that water runs in the ditch above; and in the same way I have often found the water reach the surface from a main taken across the line of fall, when the drains leading into it have lain the land above perfectly dry. *Hewitt Davis, 3, Frederick Place, Old Jewry, London.*

Hampshire Statistics.—Mr. Hawley's circular to us landlords is considered very imperfect to attain any real or satisfactory evidence as to the condition of the land, its yield, and the kind of implements in use, &c. There is much good land unreclaimed, and very little attention paid to the fences, hedges, and ditches; and as to draining nothing at all. The cottages of some proprietors are in a very tumble-down condition; windows out, no wells for water, and puddles around the doors. I shall not name the owners, but I believe the agents are to blame. My lord cannot come himself, and his heart is not so inclined as to permit such a state of things. Deep ploughing is disregarded by many in spite of the old saying:—

"Plough deep whilst sluggards sleep,
And then you shall have plenty to sow and to reap."

And vastly true it is. One will grow nine sacks of Wheat and his next-door neighbour only five. The Turnips of one grow away all harvest, whilst those of the other stand still for a shower, then they commence growing again. We should have been glad to have taken a district for Mr. Hawley. The Scotch statistics are a pattern to all, and so is their farming. *X. Y. Z., Hants.*

Statistics.—So much has been said of the value of agricultural statistics that it requires a species of hardihood to entertain any doubt of their utility. The country insists upon knowing the quantity of food on hand or in prospect! but, in complying with this demand, the farmers may be permitted to hesitate about divulging the number of labourers they employ, or describing their mode of management, or giving pedigrees of their stock. The information sought need not entail upon the person supplying it any unpleasant inferences, or partake of the nature of a repulsive task. The returns should not be so inquisitorial or diffuse as to harass or perplex an intelligent man, much more an uneducated one; but be framed so as, if possible, to invite a voluntary statement of the few facts really essential. Then all honest men may be expected to co-operate cheerfully; as, if willingly rendered, the replies will be so much the more full and accurate, and therefore more useful and complete. A list of queries should be issued about the month of May, when all the land is appropriated to the different crops intended to be grown, and when the quantity of Wheat and other grain, Pulse, Potatoes, and other roots, Clover and other seeds, in cultivation and pasture may be ascertained. A second return should be taken about October, when all the corn crops will probably be secured, and when the quantity and quality, the condition and average yield of each article of agricultural produce will be sufficiently notorious to enable the "enumerator" or inspector to check or verify any startling or irregular declaration. This much for vegetable matter. If, further, animal life should require examination and details, the greatest care should be used to frame the queries in the most simple and efficient manner possible. It may be suggested that, with respect to horned stock, they may be classed as of all ages, or under the heads of cows, stores, and feeding beasts;—sheep, or as ewes, lambs, shearlings, and other sheep;—pigs of all ages;—horses, as those under three years of age, cart-horses, other horses;—wool;—poultry in classes, and eggs, are thought by some to require answers, but they would be liable to error, and are not of so great importance as other kinds of farming stock; even horses present a difficulty, as not being articles of food, and so many being used and maintained by other than occupiers of land; but they are articles of agricultural produce and they are great consumers of agricultural produce, and their number seems requisite to be known for the solution of various knotty problems of political and social economy. In organising the machinery for collecting and arranging these data, superintendents of districts devoted to the business seem necessary; the relieving officers of Poor-law unions might be advantageously associated in these labours, as in the census, at least in the commencement of any plan, as they are well-acquainted with the farmers, and indeed with the inhabitants generally; other assistants can of course be added, according to the extent and richness of the several districts. The indirect consequences of a measure of this sort may be estimated as of nearly equal importance to those directly contemplated, when a cosy farmer is obliged to state an undue proportion of white crops when the colour ought to be green, the confession will gradually lead to better customs, and efforts will, no doubt, be made to cut a tolerable figure in the number of quarters grown per acre, as well as the quantity of live stock upon the farm; but, above all, these annual or half-yearly accounts will lead to attempts being made of keeping regular accounts by hundreds who never before dreamed of taking stock. And when once this practice is begun, common prudence will speedily recognise the value of the habit, and John Bull will in his own good time, notwithstanding his constitutional eccentricity of temper, become reconciled to the arbitrary innovation of statistics. *J. W., Peterborough.*

Agricultural Societies.—I have been a little interested in your remarks on farmers' clubs. I fear the attempt to establish a central farmers' club for the discussion of agricultural politics will not meet with general approval from the other farmers' clubs throughout the kingdom. As far as it is practicable, I have no doubt it will prove the best policy to exclude politics from the discussions carried on at agricultural meetings, simply because politicians have plenty of other opportunities of expressing their sentiments, or of otherwise using their influence in promoting their own views. And besides, agriculture is not so barren a field as to require assistance from such a quarter. Nevertheless, it must be confessed that it is often difficult to draw the line of distinction between what is strictly agricultural, and what may be considered as touching upon the political. Why, the constitution of the Royal Agricultural Society forbids it from having anything to do with agricultural statistics. This, it will be generally admitted, is very unfortunate at this crisis in the question. On the other hand the Highland Society takes a very different view of this subject, and has been of the greatest service in testing the machinery whereby correct data can be best obtained for supplying the disgraceful want of information, in regard to the amount of our agricultural produce. How then are we to distinguish between the political and agricultural, for it is evident that we may be too tight-laced on some questions, while it is highly desirable we should not be so. I have no doubt a central (almost) strictly agricultural club might be of the greatest service to agricultural progress, in merely assisting to direct the discussions of the other farmers' clubs throughout the country; by this means united action might be secured, and peculiar views arising from diversity of circumstances might also be rendered far more instructive, whatever the subject happened to be. I believe this might be the means of reviving many a feeble club. If such men as Mr. Baker, Mr. Fisher Hobbs, Mr. Mechi, and Mr. Hope, Fenton, or other experienced agriculturists agreed on what subjects were best to be discussed, I do believe the character of the subjects might be safely left in their hands. On many questions a little more unison in action might be attended with the happiest results. Would the statistical question, or the guano-monopoly question, or any other question, not be promoted far better by the united efforts of all the clubs, than by the solitary efforts of any club, however influential? On one point I have often thought agricultural societies greatly erred, that is in having too many discussions in one year. A good thing in this way becomes too common, and unless the club is a very powerful one, such as the London Farmers' Club, you may depend upon it this will prove a source of weakness. One or two discussions a year might be a very healthy stimulus to many a weak club, but a dozen would assuredly be a deadly dose to the strongest. I am inclined to think this may have formed an injurious element in some of the dead and dying farmers' clubs which you chronicled in the *Gazette* the other week. *R. Russell, Kilwhiss.*

Draining Plough, &c.—In the 9th volume of the Journal of the Royal Agricultural Society of England, there is an article on the farming of the North Riding. The author of it mentions that a Mr. Maynard used successfully a draining plough to assist in cutting the drains in his clay land. If you are able, I should feel greatly obliged by your giving me an idea (through your *Gazette*) of the character of the plough used for the purpose, and whether you are aware of its successful use in other localities. I have also another favour to ask of you, as to the method of preparing calves for the shambles the day or so before their death. Fattening calves for veal is very unusual here, but when it is done and the calf is sold, the butcher comes the day before it is to be killed, and bleeds it in the neck, till it cannot stand, and repeats the operation the following morning. I have now one in my yard in the above condition, and have much doubt whether so barbarous a system is in vogue in Essex and other places where much veal is produced. *Rusticus.* [It is very generally in vogue.]

Breeding of Horses and Pigs.—I was much interested

with that portion of "J. G.'s" remarks which had reference to the breeding of horses and dogs, and as your correspondent was kind enough to say he would communicate still further information privately, I shall be glad of his address. As to the cross recommended between the Highland Scot and short-horn, there is no doubt of its answering as a first cross. The produce of a good Durham bull and a Galloway cow is a very perfect animal, perhaps better than would be obtained by breeding the other way; but the produce again from heifers bred in this manner by a short-horn bull, show a considerable falling off in quality. How they might have succeeded had they been tried again with the Scot, I am not able from experience to state. By some it is, I know, supposed that the short-horns themselves have had a dip into the Galloway blood at some remote period, and that to this some of their peculiarities are attributable. I know the late Mr. Webb Edge, of Strelly, tried several experiments on this cross, but even his success, I believe, was doubtful. If anything could have been done, Mr. Edge was a likely man to do it; he had great discernment, and he would breed from nothing that was not first-rate of its kind. His pointers, and they were cross bred, were a marvel, as those who were fortunate enough to purchase them can testify—speed, great endurance, and steadiness were combined; but, with all this, I am not aware of more than one person who has succeeded in breeding good dogs from them: I have not, and I must say that I hold to the pure breed in most things. Crossing past a first cross has not answered for me; I always say, "Cross blood as much as you like, but do not cross breed." *W. Lort, Great Heath, Tenbury.*

House-Feeding Sheep.—Major M'Inroy has my thanks for his reply to my inquiry relative to the breed of sheep he alluded to as having house-fed and sold at such dismal rates, which I thought so discouraging that, if allowed to pass without notice, might do mischief by deterring feeders of sheep from attempting to house them, which system (except in some favoured localities) I believe to be by far the most profitable method of making mutton, and though I have had the boards in use about four years, I never yet had one single sheep out of health whilst so confined. The Major asks the value of my hogs when put up to feed; to this I reply that, on the 6th of December, 1852, the 11 hogs weighed 907 lbs., and the following 4th of April the butcher took 6 away, weighing 807 lbs., and April 11th he had the remaining 5, weighing 729 lbs., thus giving, on the 11 hogs, from December 6th to the April dates, an increase of 629 lbs., and this at a cost of only one halfpenny per day for purchased food. Now we will come to the age of the hogs. The Major states his when sold to be 13 months old; mine might possibly average two weeks more, as the lambing commenced January 21, and finished March 24; and when I state that my land is 1100 feet above sea level, the Major must admit that he is quite as favourably circumstanced as I am in regard to climate: he values the rental of his land at 16*s.* per acre—thousands of uncultivated acres around my grounds he may have at 5*s.* per statute acre. Now arrives the important question, how it occurs that his house-fed hogs only make about 24*s.* 9*d.* clipped, whilst mine (but unclipped) averaged 43*s.* 10½*d.*? The solution I believe to be this—the Leicester will not do for either him or me—the soil and climate quite unsuitable; the South Downs do not increase the weight of the Cheviots, and I am fully persuaded that if the Major will confine the breed of his flock to pure first quality Cheviot ewes, and put to these well-selected Gloucestershire Cotswold rams, he will never again have to name so discouragingly low a figure for his house-fed hogs as he alluded to at the Fettercairn Farmers' Club.—*George Wm. Fowler, Prince Hall, Dartmoor, Dec.* 29, 1853.

Foreign Correspondence.

Curibaya, Peru, August 22, 1853.—[We have been favoured with the following communication by the brother of the writer to whom it was addressed.] "I am happy to note the success of your experiments with guano; it could hardly be otherwise. Choose always a day when there is a prospect of a shower for its application. Mix it, to make it more divisible, with the dry manure from the pond I suppose you have in Blandfield, and try its effects on hastening the maturity of plants, for which our summers in general are too short, such as Cucumbers, even Melons in sheltered borders, Maize, Capsicums, &c. How finely the great Author of Nature has fitted in everything the means to the end to be accomplished, and with what wisdom adjusted that system of compensations everywhere traceable in the world around us. Here is a country—'a dry parched land'—its soil a worthless, unproductive sand, which the former and the latter rain never moistens; and to which the application of common animal manure would be worse than useless, inasmuch as instead of undergoing decomposition it would only dry, and thus aggravate, by keeping the earth open, the want of humidity necessary to vegetable life. But its coasts teem with the remedy; in guano, we have not only the food vegetation principally requires, but have it presented exactly in the form in which, by chemical reaction on the atmosphere, produces in no small degree the humidity that Nature has denied us. Here, then, 'the bane and antidote are both before us;' did it rain, the ammoniacal salts would be dissipated and lost; it does not rain, and the ammonia in a great measure compensates the want. You cannot form an idea of the immensity of the deposits of guano at particular places along these coasts. Thousands of millions of tons are as difficultly comprehensible as they are easily written, but applied to the quantity of guano on the coasts of Peru, involve no exaggeration. It is rapidly coming into universal use. All the European nations, the United States, the West Indies, and even China itself, now consume it; and there can hardly be a doubt that the despised 'cormorant's dung' of our early navigators will become an element in human progress, a source of increased comfort and happiness to man, compared with which the gold of California and Australia sinks into insignificance. When, William, were these deposits formed? The birds that produce them still abound, but it requires a life-time to add an inch to their thickness, and here we have hundreds, not of feet but of yards accumulated. The geologist, indeed, with his 'periods' will soon answer our inquiry, perplexing us only the more by assuring us that they are quite recent—and recent they must necessarily be, compared with that epoch when the peaks of the Andes were but a chain of small islands; or earlier still, when the ocean deposited on the summit of the mountain of Potosi the sea shells mine own hands have gathered; but we can form no more definite idea of such 'periods,' and by consequence of the age of the planet we inhabit, than we can fix a date for the time when 'the morning stars sang together, and all the sons of God shouted for joy.'"

Notices of Books, &c.

Essays on Agriculture. By the late Thomas Gisborne Esq., of Yoxall Lodge, Staffordshire. (Reprinted by permission from the "Quarterly Review.") John Murray, Albemarle Street.

Most of our readers will have read the earlier portions of this little volume in the pages of the "Quarterly Review," where they originally appeared. The paper on Land Drainage has had an independent publication since its appearance in the Review, and in its separate form was commended to the notice of our readers. The last paper of the four here published is on so-called "High Farming," and is equal to any of the others in point of readableness and interest. The works reviewed are those of Mr. Pusey, Mr. Huxtable, Mr. Caird, Mr. Milne, and others. The theory of manures furnishes the main topic of discussion; and any one wishing to see the aspect in which such a subject appears to the practical man, the man of science, and the popular amateur respectively, will find very well-drawn pictures presented to him here. We make an extract on agricultural literature generally; and are the more ready to do so, as, written by such a man, it contains so high a compliment to the correspondents of the *Agricultural Gazette*:—

"The reproach of British agriculture, that she had no literature, is fast passing away. The works which we have placed at the head of this article would be creditable to any science or to any age. We are not acquainted with the agricultural publications north of the Tweed, but we have been told that they have great merit. We constantly see with wonder and admiration the variety and spirit by which the Royal Agricultural Journal is sustained. The *Agricultural Gazette*, attached to the *Gardeners' Chronicle*, contains almost weekly some practical article of sterling value. The letters of the *Times'* commissioner have ably supplied a deficiency which has existed ever since the time of Arthur Young's agricultural tour. They have informed the general body of agriculturists of the varieties of practice which have obtained a permanent footing in various districts, causing each to contribute its quota of knowledge and experience to the general stock of information. In offering our own humble mite we are indeed proud of our fellow-labourers."

The Farmer's Assistant and Agriculturist's Calculator. By John Grieve, Engineer and Land Surveyor, Smallholm. Arthur Hall, Virtue & Co., London.—This little work is not only a ready reckoner in a good many sorts of agricultural calculations, such as those relating to the cost of draining and of any other lineal operation, to the cost of sowing and digging and any other surface operation, to the value of grain and any other material of solid contents, to values such as wages into which time enters as an element, to the measurement and weight of cattle, on which there is very full information; but it is also a treatise on land-draining, on land-surveying, and on various other departments of agricultural engineering. It is a very respectable and useful performance in all these respects.

Poultry.

The Birmingham Show.—I was surprised on reading a late number to see it stated in the report of the Birmingham Show that there was not a purely black Cochin China cock in the exhibition; this is certainly doing an injustice to the class, for to go no further than myself, I had two there as black as crows; they were late hatched, and were justly beaten by birds from my own stock, but they were *black*—yes, entirely free from any brassy feathers. I have observed that the blacks are too frequently placed, at exhibitions, in such dark situations that it would be difficult to tell whether they were black or brown, indeed it has often puzzled me to distinguish the cocks from the hens. To be seen to advantage, no fowls require more light than the blacks; in a bad light the fine metallic lustre upon the feathers is not seen at all. They also look better, perhaps, when placed a little below the level of the eye. I am fond of the blacks, and should like to see them become favourites with others. *W Lort, Great Heath, near Tenbury.* [Many of these so-called pure black Cochin China cocks appear so, till they are taken out and examined, when the peccant feathers are seen. It is the more remarkable because the pullets are always of a pure and good colour. I have, I think, some of the best black pullets ever seen; but although I have bought perfectly black young cocks, at large prices, I have not one that does not show coloured feathers as he approaches maturity. *The Reporter.*]

Miscellaneous.

Improvements in Agricultural Machinery. (A communication.) By J. H. Johnson, of Lincoln's-Inn-Fields.—Patent granted May 10, 1853. (No. 1151.)—Claims: 1. The general arrangement and construction of machinery, apparatus, or means for accomplishing agricultural operations, as described. 2. The system or mode of digging or disintegrating the soil, and of reaping, mowing, and performing other agricultural operations, by means of mechanism actuated directly by steam-power, but traversed or conveyed over the land by horse, or other separate power, the same being applicable for the cutting of drains. 3. The application and use in digging or pulverising operations of a digging or soil-loosening cylinder, which is driven at a high velocity by steam-power. 4. The application and use of spring-hinged arms for receiving the cut grain, or other crop, as described. 5. The application and use of a hollow or tubular driving or first-motion shaft, arranged to work loose upon the axle of the supporting running-wheels, as described. 6. A system or mode of driving the main running-wheels, whereby the machine is rendered self-locomotive. 7. The simplified arrangement and use of the steam cylinder and valve, and gearing, as described. 8. The application and use of the levelling-box, or grating and roller, in conjunction with a seed-box or manure-distributor. 9. The mode of sowing or distributing seeds and manure by apparatus driven by the travelling motion of the machine. 10. The mode of effecting agricultural operations by the use of a machine, in which the horses or actuating medium go before the pulverising apparatus in digging, preparing, and sowing, and behind it in reaping and mowing. 11. The mode of arranging the platform-wheels, either in the same plane or in a different plane, with the large running-wheels. 12. The mode of supporting the digging-cylinder or rotary arms by means of a frame carried on fixed centres in the body of the cart, and capable of adjustment vertically. 13. The mode of facilitating the turning of the machine at the head-lands, by elevating the hind or trailing-wheels, and thus throwing the whole weight of the implement upon one pair of wheels. *Mechanics' Magazine.*

Calendar of Operations.

JANUARY.

Wester Ross, *Jan.* 3.—Out-door operations are for the present entirely suspended, save such as carting manure. On the morning of the 26th we were surprised to find that a large quantity of snow had fallen, and throughout that day it continued to descend abundantly, and, a strong northerly wind prevailing, it was driven in beautiful abundance into every hollow, and with admirable dexterity through every aperture, however small; and such is the intensity of the frost now that the earth bids fair to be held in its icy grasp, and covered with its mantle of white for some time to come. The ground being now sealed up from the operations of the labourer, the price of every eatable being unusually high, the pittance from the Poor-law board being so stinted as to supply the recipient with the means of only a scrimp subsistence, even in a year when provisions are cheaper than now, and begging being now entirely prohibited, this is a year in which, I greatly fear, many will sit at a table on which there will not be enough to supply their daily returning wants; will sit at a fire insufficient to keep up the necessary rate of circulation, and lie down in a bed on which there will not be covering enough to keep the poor one from feeling the intensity of the cold. Fortunate it is for the Highlands that the Potatoes did not fail this year, as they have done for years by-gone. The prices of grain are once more on the increase, and a large part of the late decline has been again recovered, and unless the importation of grain be very liberal throughout the spring months prices must still farther advance. Wheat is but a poor affair in many parts in the north, and in the south it is not greatly better. I mentioned early in the season that Oats were turning out ill; but as we still further test them by measure and weight, we find they are worse even than we anticipated. Not only is there a miserable return per acre, but the quality is little better than ordinary dressings. The miller is receiving Oats so light as 36 lbs. per bushel; and I have scarcely heard of any this season weighing so high as 42 lbs. per bushel, which is our standard for Oats. I should not be surprised to see, ere we have another crop, Oats selling so high as 2*l.* per quarter. Barley turns out well, weighs heavy, and brings a good price. There have been a large quantity of superior Potatoes shipped from the north this season, and there are still a good many to dispose of. The season having been dry and open up till now sheep have thriven well on the Turnips, and there having been an average crop of Turnips in this quarter, there will be a good many fat cattle to dispose of by-and-by.

Notices to Correspondents.

Blindness in Sheep. *P V R.* Sheep are more frequently affected with disease of the eyes, and even blindness, than is generally supposed. The causes may either be a plethoric state of the system or external injuries. The best remedy is bleeding from the eye-lids and the eye vein. *W. C. S.*

Fruit Trees: *J M B.* It is reasonable under the circumstances to expect you should be paid for them, but as to what the law or the custom is, you must consult your legal adviser. To another correspondent who writes from Pwlheli we must make the same answer. We are not learned in the law.

Peat Charcoal: *C L.* We do not know where it is sold. That is a thing the salesmen should advertise.

Perforation in Pig's Leg. *Anon.* The purpose of these perforations is probably to furnish a supply of lubricating secretion for the diminution of friction. *W. C. S.*

Small Farm: *R J.* Blacker on Small Farms, O. Roberts on Agricultural Economy. We do not know any account book for small farms especially.

Sow: *G J C.* Feed her well; a few Beans will be useful. If medicine is wished for, give five drops of tincture of cantharides in her food. *W. C. S.*

FENDERS, STOVES, AND FIRE-IRONS.—Buyers of the above are requested, before finally deciding, to visit WILLIAM S. BURTON'S SHOW ROOMS, 39, Oxford Street (corner of Newman Street), Nos. 1 and 2, Newman Street, and Perry's Place. They are the largest in the world, and contain such an assortment of FENDERS, STOVES, RANGES, FIRE-IRONS, and GENERAL IRONMONGERY as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright Stoves, with bronzed ornaments and two sets of bars, 2*l.* 14*s.* to 3*l.* 10*s.*; ditto, with ormolu ornaments and two sets of bars, 5*l.* 10*s.* to 12*l.* 12*s*; Bronzed Fenders complete, with standards, from 7*s.* to 3*l.*; Steel Fenders from 2*l.* 15*s.* to 6*l.*; ditto, with rich ormolu ornaments, from 2*l.* 15*s.* to 7*l.* 7*s.*; Fire-irons from 1*s.* 9*d.* the set to 4*l.* 4*s.* Sylvester and all other Patent Stoves, with radiating hearth plates. All which he is enabled to sell at these very reduced charges,

1st,—From the frequency and extent of his purchases; and,

2dly,—From those purchases being made exclusively for cash.

DISH COVERS AND HOT-WATER DISHES in every material, in great variety, and of the newest and most *recherché* patterns. Tin Dish Covers, 6*s.* 6*d.* the set of six; Block Tin, 12*s.* 3*d.* to 28*s.* 9*d.* the set of six; elegant modern patterns, 34*s.* 0*d.* to 58*s.* 6*d.* the set; Britannia Metal, with or without silver-plated handles, 76*s* 6*d.* to 110*s.*6*d.* the set; Sheffield Plated, 10*l.* to 16*l.* 10*s.* the set; Block Tin Hot-water Dishes, with wells for gravy, 12*s.* to 30*s.*; Britannia Metal, 22*s.* to 77*s.*; Sheffield plated, full size, 11*l.* 11*s.*

GAS CHANDELIERS AND BRACKETS.—The increased and increasing use of gas in private houses has induced WILLIAM S. BURTON to collect from the various manufacturers all that is new and choice in Brackets, Pendants, and Chandeliers, adapted to offices, passages, and dwelling-rooms, as well as to have some designed expressly for him; these are now ON SHOW in one of his TEN LARGE ROOMS, and present, for novelty, variety, and purity of taste, an unequalled assortment. They are marked in plain figures, at prices proportionate with those which have tended to make his Ironmongery Establishment the largest and most remarkable in the kingdom, viz., from 12*s.* 6*d.* (two lights) to 16*l.* 6*s.*

LAMPS OF ALL SORTS AND PATTERNS.—The largest, as well as the choicest, assortment in existence of PALMER'S MAGNUM and other LAMPS, CAMPHINE, ARGAND, SOLAR, and MODERATEUR LAMPS, with all the latest improvements, and of the newest and most *recherché* patterns, in ormolu, Bohemian, and plain glass, or papier-mâché, is at WILLIAM S. BURTON'S, and they are arranged in one large room, so that the patterns, sizes, and sorts can be instantly selected.

PALMER'S CANDLES, 8½*d.* per lb.—Palmer's Patent Candles, all marked "Palmer."

Single or double wicks	...	...	...	8½*d.* per lb.
Mid. size, 3 wicks	...	...	...	9*d.* "
Magnums, 3 or 4 wicks	...	...	...	9½*d.* "
English Patent Camphine, in sealed cans				5*s.* 9*d.* per gallon.
Best Colza Oil	...	...	...	4*s.* 0*d.* "

WILLIAM S. BURTON has TEN LARGE SHOW ROOMS (all communicating), exclusive of the shop, devoted solely to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated and Japanned Wares), Iron and Brass Bedsteads, so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

No. 39, Oxford Street (corner of Newman Street); Nos. 1 and 2, Newman Street; and 4 and 5, Perry's Place.

THE COMFORT OF A FIXED WATERCLOSET for 1*l.*—Places in gardens converted into comfortable waterclosets by the PATENT HERMETICALLY-SEALED PAN, with its self-acting valve, entirely preventing the return of cold air or effluvia. Any carpenter can fix it in two hours. Price 1*l.* Hermetically-sealed Inodorous Chamber Commodes, 1*l.* 4*s.*, 2*l.* 6*s.*, and 3*l.*; also Improved Portable Waterclosets, with pump, cistern, and self-acting valve. Articles forwarded by railway, carriage paid. A prospectus, with engravings, forwarded by enclosing two postage stamps.—At FYFE & CO.'S, 26, Tavistock Street, Covent Garden, London.

THE MECHIAN DRESSING CASE, the most most portable ever invented, being only the size of a pocket-book, containing One Pair of MECHI'S Ivory-handled Peculiar Steel Razors, his Magic Strop, Comb, Badger-hair Shaving Brush, and Nail and Tooth Brushes, price only 25*s.*; the same with Hair Brush and Soap Dish, 35*s.* To military men, and as a steam-boat or travelling companion, this invention is an invaluable acquisition. An immense variety of other Dressing Cases for ladies and gentlemen, either in fancy woods or leather, at all prices, to suit either the economical or luxurious. An extensive stock of Writing Desks, Writing Cases, Work Boxes, Bagatelle Tables, Razor Strops, Table Cutlery, Superb Papier Maché articles, &c.—Manufactory, 4, Leadenhall Street, four doors from Cornhill.

THE ROYAL EXHIBITION.—A valuable, newly-invented, very small, powerful, waistcoat-pocket Glass, the size of a Walnut, to discern minute objects at a distance of from 4 to 5 miles, which is found to be invaluable for YACHTING, and to SPORTSMEN, GENTLEMEN, and GAMEKEEPERS.

TELESCOPES.—A new and most important invention in Telescopes, possessing such extraordinary powers that some—3½ inches, with an extra eye-piece—will show distinctly Jupiter's Moons, Saturn's Ring, and the Double Stars. They supersede every other kind, and are of all sizes—for the waistcoat-pocket, Shooting, Military purposes, &c. Opera and Race-course Glasses with wonderful powers; a minute object can be clearly seen from 10 to 12 miles distant. Invaluable Acoustic Instruments for relief of extreme Deafness.

Messrs. S. & B. SOLOMONS, Opticians and Aurists, 39, Albemarle Street, Piccadilly, London, opposite the York Hotel.

CHRISTMAS.—At the Social Reunions of this Season, the fair and youthful are more than usually desirous of shining in Personal Attraction under the gaze of many friends, and the following unrivalled discoveries for the toilet are called into increased requisition, namely, ROWLANDS' MACASSAR OIL, for creating and sustaining a luxuriant head of hair; ROWLANDS' KALYDOR, for rendering the skin soft, fair, and blooming; ROWLANDS' ODONTO, or Pearl Dentifrice, for imparting a pearl-like whiteness to the teeth; and ROWLANDS' AQUA D'ORO, a fragrant and spirituous perfume, an essential accompaniment to places of public amusement and crowded assemblies. The patronage of royalty throughout Europe, and their general use by the aristocracy and the élite of fashion, render them a peculiarly elegant and seasonable present. Beware of spurious imitations. The only genuine of each bears the name of ROWLANDS' preceding that of the article on the wrapper or label.—Sold by them at 20, Hatton Garden, London; and by Chemists and Perfumers.

WM. HALSE'S FIVE GUINEA APPARATUSES are now ready.—Invalids are solicited to send to Mr. W. HALSE, of 22, Brunswick Square, London, for his Pamphlet on MEDICAL GALVANISM, which will be forwarded free, on receipt of two stamps. In it will be found the particulars of cures in cases of asthma, rheumatism, sciatica, tic doloureux, paralysis, spinal complaints, headache, deficiency of nervous energy, liver complaints, general debility, indigestion, stiff joints, nervous disorders, &c. Mr. HALSE'S method of applying the galvanic fluid is quite free from all unpleasant sensation. Terms: One Guinea per week. The above Pamphlet contains his Letters on Medical Galvanism.

EDUCATION FOR YOUNG LADIES,
AT CHESHUNT, HERTS, ADJOINING THE NURSERIES.

MISS PAUL, who has had several years' experience in Tuition, begs to announce that she has vacancies for a few Pupils as Boarders. Terms moderate. Prospectuses will be forwarded by post on application.

THE VINE DISEASE EFFECTUALLY CURED BY WATSON'S BLIGHT EXTERMINATOR AND PREVENTIVE, for present application to Grape Vines, Fruit Trees, &c. Price 2*s.* 6*d.* per bottle.—To be had of H. WATSON, 198, Shoreditch; W. DENYER, 82, Gracechurch Street, and of all Florists and Seedsmen.

Country orders amounting to £10 or upwards carriage free. Price lists sent on application.

DARE'S REGISTERED PICCADILLY SHIRT COLLAR, price 12*s.* per dozen; or a sample Collar sent by post for 14 stamps. Measure required round the neck.

SHIRTS made from the best long-cloths and linens, at 33*s.*, 40*s.*, and 45*s.*, the half-dozen.—A. N. DARE, 88, Piccadilly, London.

NO CHARGE FOR STAMPING ARMS, CRESTS, INITIALS, &c., on paper and envelopes, at LOCKWOOD'S well-known establishment, 75, New Bond Street. Good cream-laid Note-paper, five quires for 9*d.*; Thick ditto, five quires, 1*s.*; Albert and Queen's sizes, five quires for 6*d.*, 9*d.*, and 1*s.*; Envelopes, 3*d.* to 1*s.* 6*d.* per hundred; Foolscap paper, 7*s.* 6*d.* per ream; Copybooks, 2*s.* 6*d.* per dozen. Card Plate engraved, 2*s.* 6*d.*; 100 Cards printed, 2*s.* 6*d.* Mourning Stationery equally cheap. Wedding Orders promptly executed. A large variety of Writing and Dressing Cases, Envelope Boxes, Blotting Books, Inkstands, Gold Pens, Church Services, &c. Copy address, LOCKWOOD'S, 75, New Bond Street. Country orders for 20*s.* sent carriage free.

METCALFE AND CO.'S PERFUMERY DEPARTMENT.—PROPRIETARY ARTICLES.—METCALFE'S celebrated ALKALINE TOOTH POWDER is acknowledged as the safest and most efficient now in use. Dupuytren's Medicated Pomade is the most certain remedy for preventing the hair prematurely falling off, and for restoring it when baldness has already commenced. Dupuytren's Medicated Balm strengthens, cleanses, and improves the growth, and is generally acknowledged as the best wash for the hair.—Manufacturers of British and Importers of Foreign Soaps, Perfumery, and J. M. Farina's genuine Eau de Cologne, at METCALFE, BINGLEY, & Co.'s only Establishment, 130*b* and 131, Oxford Street, second and third doors west from Holles Street.

ATKINSON AND BARKER'S ROYAL INFANTS' PRESERVATIVE.—Mothers call at your Druggist's and purchase a bottle of the above. It is the best medicine in the world for infants and young children for the prevention and cure of those disorders incident to infants; affording instant relief in Convulsions, Flatulency, Affections of the Bowels, Difficult Teething, &c. &c., and may be given with safety immediately after birth. It is no misnomer cordial! no stupefactive, deadly narcotic! but a veritable preservative of infants! Mothers would act wisely in always keeping it always in the nursery.—Prepared only by ROBERT BARKER, Bowden, near Manchester (Chemist to Her Most Gracious Majesty Queen Victoria), in bottles at 1*s.* 1½*d.*, 2*s.* 9*d.*, and 4*s.* 6*d.* each. CAUTION.—Observe the names of "Atkinson & Barker" on the Government Stamp.

IMPORTANT TO ALL WHO SING.—From S. Pearsall, Esq., Vicar Choral of Lichfield Cathedral:—"A lady of distinction, having pointed out to me the qualities of Dr. LOCOCK'S PULMONIC WAFERS, I was induced to make trial of a , and from this trial I am happy to give my testimonial in their favour. I find by allowing a few of the wafers—taken in the course of the day—to gradually dissolve in the mouth, my voice becomes bright and clear, and the tone full and distinct. They are decidedly the most efficacious of any I have ever used."—Dr. Locock's Wafers give instant relief and a rapid cure of asthma, coughs, and all disorders of the breath and lungs. —Price 1*s.* 1½*d.*, 2*s.* 9*d.*, and 11*s.* per box. Sold by all Druggists. Beware of counterfeits.

QUANTITY AND QUALITY OF THE HAIR.

NO TOILET can be considered complete without a careful attention to that department which so materially affects the entire contour, viz., the Hair, which, both in quantity and quality, is susceptible of the most material alteration. That which is weak can be strengthened, and be made to receive a most beautiful gloss by artificial applications. It is to its extraordinary and valuable properties in these respects that is due the character of C. AND A. OLDRIDGE'S BALM OF COLUMBIA, for its invigorating, nutritious, and regenerative qualities. OLDRIDGE'S BALM causes Eyebrows to grow, prevents the Hair from turning grey, and the first application causes it to curl beautifully, frees it from scurf, and stops it from falling off. Price 3*s.* 6*d.*, 6*s.*, and 11*s.* per bottle. No other prices are genuine.—N.B. Ask for OLDRIDGE'S BALM, 13, Wellington Street North, Strand, London.

DO YOU WANT LUXURIANT HAIR, WHISKERS, &c.?—EMILY DEAN'S CRINILENE has been many years established as the only preparation that can be relied upon for the Restoration of the Hair in Baldness from any cause, preventing the Hair falling off, strengthening weak Hair, and checking Greyness, and for the production of Whiskers, Moustachios, Eyebrows, &c., in three or four weeks with certainty. It is an elegantly scented compound, price 2*s.*, sold by all chemists, or will be sent post free, on receipt of 24 penny postage stamps, by Miss DEAN, 37*a*, Manchester Street, Gray's Inn Road, London.—"I have used your Crinilene, and have now a good pair of Whiskers." J. L. HIGGS, Dudley.—"It has certainly improved my hair." J. THOMPSON, Durham.

RUPTURES EFFECTUALLY CURED WITHOUT A TRUSS.

ALL Sufferers from this complaint are earnestly invited to consult or write to Dr. LESLIE, as he guarantees them relief in every case. His remedy has been successful in curing thousands of persons during the last 11 years, and is applicable to every kind of single and double rupture, however bad or long standing, in male or female of any age, causing no confinement or inconvenience in its use whatever. Sent post free, with full instructions, on receipt of 7*s.* 6*d.* in postage stamps, or Post Office order, payable at the General Post Office, to Dr. HERBERT LESLIE, 37*a*, Manchester Street, Gray's Inn Road, London, where he may be consulted daily, Sundays excepted, from 11 till 1, mornings, and 5 till 7 evenings only.

PAUL GAGE'S ELIXIR.—This family medicine has been established 44 years as a most valuable remedy for

PHLEGM,

and all the disorders arising from it, viz., bilious complaints, catarrh, asthma, convulsive coughing, indigestion, colics, cholera morbus, ague fevers, gout, worms, hooping cough, females' complaints, &c. It is demonstrated in a pamphlet on Phlegm, delivered gratis at all the depots, why PAUL GAGE'S ELIXIR has not failed in desperate cases, where other means have been found of no avail. Sold in bottles at 2*s.* 9*d.*, 4*s.* 6*d.*, and 11*s.*, by PAUL GAGE, 462, New Oxford Street; and by all respectable medicine vendors.

WINTER OVERCOATS AND CAPES, Superior Garments at reduced charges, one of the largest Stocks in London, all thoroughly waterproof; also of ditto for Youths, at W. BERDOE'S, 96, New Bond Street, and 69, Cornhill—(nowhere else.)

BY HER MAJESTY'S ROYAL LETTERS PATENT.

BAILY'S ROUP AND CONDITION PILLS FOR POULTRY.—This remedy has been extensively tried with uniform success, and is offered to amateurs and the public with the greatest confidence. It will effectually over come that disease which has hitherto been the bane of the poultry-yard, and destroy that apprehension known to all poultry keepers, when a favourite and valuable fowl is seen to droop. It is inestimable for poultry returning from exhibitions, and greatly facilitates moulting.—Sold, with full instructions for use, in boxes containing 50 pills, by JOHN BAILY, 113, Mount Street, Grosvenor Square, price 3*s.* per box, or by post 3*s.* 4*d.* "Fowls by Baily," the most useful and plainest treatise of the day; price 2*s.*, by post 2*s.* 6*d.* Baily's Registered Fountains, universally adopted and approved. Drawings and particulars, by post, on application.—113, Mount Street, Grosvenor Square.

DAMAGED WHEAT AND RICE MEAL FOR PIGS is now acknowledged to be the best and cheapest FOOD. It is now being extensively used by all the large Pig feeders in the kingdom. To whom reference can be given. In order that small consumers may test the merits of each, JAMES MAY and Co. will send 1 quarter of Wheat and 2 cwt. of Rice Meal for Post-office order of 2*l.* 18*s.*, including sacks.

DAMAGED WHEAT	...	...	...	35*s.* per qr.
RICE MEAL	...	...	...	9*l.* per ton.

JAMES MAY & Co., Finsbury Wharf, City Road Basin, London. Delivered free to any Railway in London. 1*s.* 6*d.* each charged for Sacks.

"HIGH FARMING UNDER LIBERAL COVENANTS."
DAIRY, PIG, AND POULTRY FARM.

WANTED immediately, in England or Wales, a Pretty COTTAGE or Modern FARM-HOUSE, with about 100 ACRES (more or less) of Prime Light LAND for first-class varieties of the above stock. The Jersey system of Cropping, Spade Husbandry, and most approved general management will be gradually introduced. Advertiser will be found an eligible improving tenant, and thoroughly solvent.—Address, RICHARD PAYNE, Esq., Daventry, Northamptonshire.

TO BE LET, with immediate possession, the old-established SEED BUSINESS, 181, High Street, Southampton, comprising a front shop, with a large range of Greenhouses, Hothouses, Cold and Forcing Pits, together with the Stock of Plants, Seeds, Fixtures, &c., &c. The above to be disposed of in consequence of the proprietor, Mr. Rogers, sen., finding the demand for Nursery Stock at his grounds at Red Lodge so great, that he is unable to superintend the Seed Department.—For particulars and to treat for the same, apply to Mr. RICHARD BELL, 2, Clifford Street, Southampton.

TO BE DISPOSED OF, DENYER'S NURSERY, celebrated for Roses, Fruit Trees, &c. Established 26 years, with a first-rate connection: consisting of 5 acres of land, Cottage and Seed Shop attached, of which a 14 years' lease will be granted The Proprietor being about to retire is desirous of offering the above; no goodwill is expected; the Stock, &c., to be taken at valuation.—Apply to Messrs. PROTHEROE & MORRIS, Leytonstone, Essex, or Mr. E. DENYER, on the premises, Loughborough Road, Brixton, within 3 miles of London.

PRIZE WHITE AND BUFF SHANGHAES.—An amateur who has this last season been highly successful at the most important Poultry Exhibitions, with both these varieties of Fowls, has now for disposal a few Pairs of WHITE CHICKENS, of unusual merit; also a White Cock hatched March, 1853, winner of the first prizes at Gloucester, Metropolitan, and Bury Shows; and a Buff Cock, Patriarch, the sire of many prize Chickens of this year, and the winner of two first prizes, being a complete model for shape and shortness of legs, &c.—For price, &c., apply to T. B. F., Maldon, Essex.

Sales by Auction.

DORKING, COCHIN CHINA, & OTHER FANCY POULTRY.
PERIODICAL SALE.

MR. J. C. STEVENS will Sell by Auction at his Great Room, 38, King Street, Covent Garden, on TUESDAY, January 17th, at 12 o'clock precisely, first-rate COLOURED DORKINGS from the yards of the Rev. F. Thursby, of Abington, Northampton, and J. W. F. Noyes, Esq., of Salisbury. Also, some very choice COCHINS from Mrs. George of Chaldon, Brahma Pootras, Spanish, &c.—Catalogues by enclosing a stamped directed envelope to Mr. J. C. STEVENS, 38, King Street, Covent Garden, London.

COCHIN CHINA FOWLS.
MR. PUNCHARD'S ANNUAL SALE.

MR. J. C. STEVENS will sell by Auction (without any reserve), at his Great Room, 38, King Street, Covent Garden, on WEDNESDAY, January 11, at 12 o'clock precisely, 160 FIRST-CLASS COCHINS, all bred by Mr. Punchard, at Blunt's Hall, Haverhill, and including many which have taken prizes at the principal Poultry Exhibitions this season, chiefly bred from descendants of his celebrated imported bird "Contest," and all of the favourite light colours.—Catalogues by enclosing a stamped directed envelope to Mr. J. C. STEVENS, 38, King Street, Covent Garden, London.

TO NURSERY AND SEEDSMEN, FLORISTS, AND CAPITALISTS.

MESSRS. ACTON & SON will Sell by Auction, at the White Horse Inn, Coppergate, York, on TUESDAY, the 24th January, 1854, at Two o'clock in the afternoon, for Three precisely (unless previously disposed of by Private Contract, of which Notice will be given), together, or in the following, or such other Lots as may be determined upon at the time of sale.

LOT 1.—Part of the VALUABLE NURSERY GROUNDS situate in Fulford Road, York, and adjoining on Property of James Backhouse, Esq., containing 8*a.* 3*r.* 32*p.*, well stocked with every variety of Choice Forest and Fruit Trees, Shrubs, Roses, &c., in vigorous growth. Upon this Lot, fronting the Fulford Road, is erected a Modern and Commodious DWELLING-HOUSE and SHOPS, with GREENHOUSE and other requisite OUT-BUILDINGS adjoining.

LOT 2.—The remaining Part of the NURSERY GROUNDS, containing 4*a.* 3*r.* 24*p.*, lying between Fulford Grange and Lot 1; and also those two Substantial DWELLING-HOUSES, constituting neat and pleasant suburban residences for small families, with suitable OUT-OFFICES attached, also fronting the Fulford Road. The Land extends from Fulford Road to the New Walk, adjoining the river Ouse, is of freehold tenure, of first-rate quality, in a high state of cultivation, and comprises valuable beds of gravel. The late proprietor, Mr. George Clarkson, for many years carried on an extensive and flourishing business on the premises, and a most eligible opening is therefore presented for any person desirous of succeeding him. The Property is also well worth the attention of capitalists as an investment, the whole being available for building purposes. The purchaser may, if preferred, take the Stock, or a portion thereof, on liberal terms, and have immediate possession. —Further Particulars may be had, and Plans of the Property seen, on application on the Premises, or at the offices of Mr. LUKE THOMPSON, Solicitor, Judges' Court, York.

On Jan. 1st was published, to be had of every respectable Bookseller and Nurseryman of the United Kingdom,

THE

NATIONAL GARDEN ALMANACK,

AND

HORTICULTURAL TRADE DIRECTORY FOR 1854.

By JOHN EDWARDS, F.H.S.,

Hon. Secretary of the National Floricultural Society; the "J. E." of the *Gardeners' Chronicle;* Florist Censor at Chiswick, Regent's Park, and many Provincial Exhibitions: President of the Stoke Newington Chrysanthemum Society; and in Committee or as Member connected with the principal Horticultural Societies of England.

In his Work will be found Lists of the Nurserymen, Seedsmen, and Florists, and comprising many hundred names not to be found in any Horticultural work extant, with at least 500 corrections of self-evident blunders to be found in those vague lists attempted by other periodical compilations.

The London Trade List must be pronounced perfection.

The Provincial includes double the firms elsewhere to be found, and all arranged in Counties and Towns Alphabetically.

The Irish and Scotch collated to the latest period, and threefold over our contemporaries.

The Continental fourfold, and from the most reliable sources peculiar to ourselves.

The American solely and exclusively our own, of which it will be pronounced we have indeed "gone ahead."

The whole containing more than 2000 Names with Addresses, and forming the most elaborate Trade Directory ever offered to the Horticultural and Floricultural public, at once totally eclipsing all existing contemporaries.

PRICE ONE SHILLING.

The Lists of New Flowers and Plants are of a character, and by such sterling authorities, which must prevent the possibility of a rival. The Garden Directions, separately and collectively, emanate from the leading cultivators of the day. Much space is devoted to Horticultural Societies, to which is added Names of Secretaries and promoters of Horticulture in connection therewith; while of Trade Announcements, as heretofore, our pages afford a summary not only of the leading but of every novelty of the season

Packets for distribution by the Nursery Trade to their customers and friends may be had at 2*l.* for 50, 1*l.* for 24, or 10*s.* 6*d.* for 12 by prepayment only, when they will be delivered at any Office or Wholesale Seed House in London.

CHAPMAN AND HALL, 193, PICCADILLY, LONDON.

Price One Shilling, on the

CULTIVATION OF THE VINE IN POTS. By R. ELPHINSTONE, Gardener to Sir R. Shafto Adair, Flixton Hall.

"A very small and very short account of an important subject, written by a good practical gardener. People so often fail in this branch of cultivation, that we can hardly have too much information concerning the methods pursued by those who are successful."—*The Gardeners' Chronicle.*

"The book before us is the production of a practical man, whom we believe to be well qualified to speak on such a subject; and we can have no hesitation in recommending his work to the attentive perusal of all who are engaged, or about to be engaged, in the cultivation of Vines in pots."—*The Gardeners' and Farmers' Journal.*

The Cottage Gardener, after enumerating the previous works on the subject, says, "By none is this pot culture made easy so well as Mr. Elphinstone in a little shilling volume, entitled 'A Treatise on the Cultivation of the Vine in Pots.'"

ARTHUR HALL, VIRTUE, and Co., 25, Paternoster Row.

POPULAR SCIENCE.

NEW WORK BY PROFESSOR JOHNSTON.

THE CHEMISTRY OF COMMON LIFE. By JAMES F. W. JOHNSTON, M.A., F.R.SS.L. & E., &c., Author of "Lectures on Agricultural Chemistry and Geology," "A Catechism of Agricultural Chemistry," &c.

It is the object of the author to exhibit in this work the present condition of chemical knowledge and matured scientific opinion upon the subject it treats of; the reader will not be surprised, therefore, should he find in it some things which differ from what is to be found in other popular works already in his hands or on the shelves of his library. It will be issued in Monthly Numbers in the following order:—

1. The Air we Breathe; The Water we Drink.
2. The Soil we Cultivate; The Plant we Rear.
3. The Bread we Eat; The Beef we Cook.
4. The Beverages we Infuse.
5. The Sweets we Extract; The Liquors we Ferment.
6. The Narcotics we Indulge in.
7. The Odours we Enjoy; The Smells we Dislike.
8. What we Breathe and Breathe for; What, How, and Why we Digest.
9. The Body we Cherish. The Circulation of Matter, a Recapitulation.

Nos. 1 and 2 are published, price Sixpence each.

WILLIAM BLACKWOOD & SONS, Edinburgh and London.

HANDSOME GIFT-BOOK—MEMORIAL OF THE GREAT EXHIBITION.

In Four handsome Volumes, cloth lettered, gilt edges, price Four Guineas, including the Supplementary Volume,

THE OFFICIAL DESCRIPTIVE AND ILLUSTRATED CATALOGUE OF THE GREAT EXHIBITION OF THE WORKS OF INDUSTRY OF ALL NATIONS, 1851.

"Every branch of science, art, and industry is here fully and efficiently represented."—*Morning Herald.*

"The Exhibition has lived its allotted time, and died; but this Catalogue is the sum of the thoughts and truths to which it has given birth—and which form the intellectual ground whereon the generations that we are not to see must build."—*Athenæum.*

"Long after the rare and curious contents of the Crystal Palace have been scattered over the world, this work will be valued as a memento and reflex of that marvellous collection."—*Atlas.*

A few Impressions remaining of the Imperial 4to Edition, printed for the Royal Commissioners, to be by them presented to Foreign Governments, &c., are now on sale. Cloth lettered, price Twenty Guineas.

London: Office at SPICER BROTHERS, 19, New Bridge Street, Blackfriars.

ON NERVOUS DEBILITY AND INDIGESTION.

Just published, New Edition, price 1*s.*; or, by post, for 1*s.* 6*d.*

THE SCIENCE OF LIFE; OR, HOW TO LIVE, AND WHAT TO LIVE FOR. With ample Rules for Diet, Regimen, and Self-Management; together with Instructions for securing perfect health, longevity, and that sterling state of happiness only attainable through the judicious observance of a well-regulated course of life. By a PHYSICIAN.

Also, by the same Author, price 2*s.* 6*d.*; by post, 3*s.* 6*d.*,

A MEDICAL TREATISE ON NERVOUS DEBILITY AND CONSTITUTIONAL WEAKNESS, with Practical Observations, illustrated with Anatomical Plates, in Health and Disease.

This work, emanating from a qualified Member of the medical profession, the result of many years' practical experience, is addressed to the numerous classes of persons who suffer from the various disorders acquired in early life. In its pages will be found the causes which lead to their occurrence, the symptoms which indicate their presence, and the means to be adopted for their removal.

London: JAMES GILBERT, 49, Paternoster Row; HANNAY 63, Oxford Street; MANN, 39, Cornhill; and all Booksellers.

ESTABLISHED 1786.

The quantities contained in the other Collections, Nos. 2, 3, and 4, will be found detailed in our NEW PRICE CURRENT AND GARDEN DIRECTORY FOR 1854. If there should be any sorts that are not required in the above Collection, increased quantities of those most desired could be sent.

COLLECTIONS OF FLOWER SEEDS.

The Collections sent out from Messrs. RENDLE'S establishment have always given satisfaction, and they have much pleasure in stating that they have this season a very superior stock of all kinds, either grown by themselves or by seed growers of the first respectability. It is on this account, therefore, that they can depend on their being quite new and correct to name.

Scale of Prices—Sent Postage Free.

One Hundred packets (choice sorts) including all the best hardy and half-hardy annuals, biennials, and perennials (see Price Current for 1854.)

The packets will be of fair average size; those who offer Collections at less rates, generally speaking, considerably reduce the size of their packets.

	Purchasers' Selection.	Own Selection.
No. 1.—100 Packets	£1 5s. 0d.	£1 0s. 0d
No. 2.— 50 ditto	0 15 0	0 12 0
No. 3.— 25 ditto	0 8 0	0 6 0
No. 4.— 12 ditto	0 4 0	0 3 0
	Large Pkts.	Small Pkts.

25 varieties choice Greenhouse Perennials	10 0	8 0
12 ditto ditto	5 0	4 0

All Flower Seeds sent postage free. Complete lists of the varieties included in the above Collections will be found in our NEW PRICE CURRENT AND GARDEN DIRECTORY FOR 1854.

RENDLE'S NEW PRICE CURRENT FOR 1854,

WITH NEWSPAPER STAMP TO GO FREE BY POST.

At the earnest solicitation of numerous friends and patrons, WILLIAM E. RENDLE & CO. have been again induced to publish another Edition of their PRICE CURRENT AND GARDEN DIRECTORY, which will be found in every respect superior to the last.

They have prepared it regardless of expense, so as to be a correct and useful Guide to the Amateur and young Gardener, a remembrancer to the more advanced in Horticulture, and a source of reference to all.

They have on the present occasion obtained the valuable assistance of Mr. Robert Errington, the Gardener to Sir P. Egerton, Bart., Oulton Park, who is well known to be one of the best practical writers on gardening of the present day.

It will contain a very serviceable descriptive Catalogue of Kitchen Garden Seeds, with prices affixed to every article; and, in addition to the descriptions, there will be short and concise cultural remarks for every kind of vegetable, introducing the best varieties for early, medium, and general crops.

The List of Flower Seeds will also be much improved, with descriptions of all the leading varieties, and good practical advice on their cultivation.

There will also be a good article on "Rotation of Crops," written expressly for the present edition by Mr. Errington.

The very useful Calendar of Operations, which has been found to be of so much service, will be improved and enlarged.

A useful "Garden Almanack" for 1854 is also introduced, and much other information relating to Gardens and Garden Operations.

The "Price Current and Garden Directory" is just published. PRICE SIXPENCE EACH, returned to purchasers. Copies can be obtained from WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth;

Or from the London Office, 294, Strand.

ALL SEEDS CARRIAGE FREE. SEE THE FOLLOWING ANNOUNCEMENT.

All Orders for Seeds above £1 (excepting heavy articles, as Grain, Tares, Clover, Seed Potatoes, &c.), will be delivered FREE OF CARRIAGE *to any Railway Station between Plymouth and Paddington. All Orders above £2* FREE *to any Station on the following Railways:—*GREAT WESTERN, BRISTOL AND BIRMINGHAM, SOUTHAMPTON AND DORCHESTER, BRISTOL AND EXETER, SOUTH WESTERN, SOUTH DEVON, SOUTH WALES, *or to any Market Town in Devon and Cornwall, or to Cork, Dublin, and Liverpool, by Steamers. All Orders for Seeds above £5, with the above exceptions, will be delivered,* FREE OF CARRIAGE, *to every Railway Station in England and Wales, and to every Steam Port in England, Wales, Scotland, and Ireland.*

The Terminus and principal Station of the South Devon Railway is close to our Union Road Establishment, so that we now enjoy direct Railway Communication to all the principal Towns in England, Scotland, and Wales. Our Premises are also within five minutes' walk of the Great Western Docks, from whence Steamers are continually running to Cork, Dublin, Belfast, Glasgow, London, Falmouth, and most of the principal Ports in the Kingdom.

Counting House, Seed Warehouses, and Plant Establishment, Union Road, adjoining the South Devon Railway, and within a few hundred yards of the Great Western Docks. Extensive Nurseries at Compton, two miles from Plymouth, for growing all kinds of Forest Trees, Shrubs, and Fruit Trees. Large Warehouses in Bath Street, and capacious Waterside Premises at the Great Western Docks, for loading and unloading Vessels.

THE CAPE, INDIA, CHINA, AND AUSTRALIAN MAIL PACKETS LEAVE THIS PORT EVERY MONTH.

All Goods not thoroughly approved of immediately exchanged; and it is particularly requested that any deficiency in quantities, or inattention to orders, be immediately communicated to us.

N.B.—All Post-Office Orders should be made payable to WILLIAM EDGCUMBE RENDLE.

SEEDS FOR EXPORTATION CAN BE OBTAINED PROPERLY PACKED TO ARRIVE IN GOOD CONDITION.

EVERY KIND OF SEED IS PROVED BEFORE IT IS SENT OUT.

WILLIAM E. RENDLE AND CO., PROPRIETORS.

ESTABLISHED 1786.

CHELTENHAM GREAT EXHIBITION OF 1854. To open on the 1st June.—In addition to all kinds of Horticultural productions, this Exhibition will comprehend every description of Implement or Article Manufactured, Designed, taken from, or in any way connected therewith.—Programmes, Schedules of Prizes, &c., may be obtained on application to the Secretary, Mr. HENRY J. COCHRANE, 128, High Street, Cheltenham.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—APPROACHING ELECTION.—Subscribers are earnestly requested to consider whether, by the laws of this Institution, they are not in conscience bound to give a preference to those candidates who for the greatest number of years have providently subscribed to the Funds from which they are now compelled to solicit relief.

SEEDS FOR IRELAND, SCOTLAND, & WALES.

SUTTON AND SONS having many customers in North and South Wales, Scotland and Ireland, whom they have supplied with Agricultural and Horticultural Seeds for many years, are well acquainted with the sorts which thrive best in each locality.

SUTTON & SONS *deliver their Goods Free of Carriage to the Seaports, and many other parts of Ireland, Scotland, and Wales. For particulars, address*

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

SEEDS—CARRIAGE FREE.

WILLIAM E. RENDLE AND CO. *have, from the very extensive patronage they have received, been induced this season to offer the following liberal arrangement to all who purchase Seeds from their establishment.*

ALL ORDERS ABOVE £5 WILL BE DELIVERED CARRIAGE FREE TO ANY RAILWAY STATION IN ENGLAND OR WALES, AND TO ANY STEAM PORT IN ENGLAND, WALES, IRELAND, OR SCOTLAND.

Two or three purchasers joining together will therefore have the advantage of having their orders delivered free of any cost for carriage.

RENDLE'S PRICE CURRENT FOR 1854 should be obtained by all who have gardens, or who take an interest in the cultivation of the soil.

HUNTER'S LONG PROLIFIC CUCUMBER, to which have been awarded more Prizes than to any other variety in cultivation. Gentlemen, Amateurs, and others desirous of successfully competing at the Exhibitions of this year, can be furnished with the above first class variety, "improved, if anything," in packets at 1*s*. and 2*s*. Fine Seeds, from fruit of surpassing excellence.—JAMES G. RENWICK, Seed Warehouse, 107, St. John Street, London.

SUPERB FLOWER SEEDS.—The following select Seeds, saved from the best varieties, sent post free at 1*s*. per paper:—Antirrhinum, Petunia, Verbena, Double Balsam, and Pansy.—From WILLIAM KNIGHT, Florist, 53, High Street, Battle, Sussex. Select lists of Seeds sent on application.

WAITE'S NEW EARLY PEA.

DANIEL O'ROURKE.—The earliest and best Pea in cultivation; a week earlier than the Emperor, longer pods, and a much better cropper; height 2½ to 3 feet. If this Pea does not give general satisfaction the money charged will be returned. Trade price to be had on application to J. G. WAITE, Seed Merchant, 181, High Holborn, London.

DOUBLE ITALIAN TUBEROSES.

DAWE, COTTRELL, AND BENHAM (successors to FREDERICK WARNER), have just received their Annual Importation of the above, in excellent condition, which they offer at 3*s*. 6*d*. per dozen, with the usual allowance to the trade. Their wholesale Lists of Garden, Agricultural, and Flower Seeds are ready, and may be obtained on application.
3, Lawrence Pountney Lane; and 36, Moorgate Street, London.
Established 28, Cornhill. 1720.

BRITISH QUEEN POTATO.—As early as a Shaw, the quality of a Regent, and one of the most productive kinds grown, recommended with perfect confidence; price per bushel, 10*s*.; per peck, 3*s*., bag included, for pre-payment only.
HART AND NICKLIN, Guildford, Surrey.

CARTER'S NEW GIGANTIC RUNNER.—In introducing this new variety of the Scarlet Runner French Bean, to the notice of his customers, J. CARTER can testify to its great superiority over the old sort. It is a most abundant bearer, and the pods are considerably longer. Price 2*s*. 6*d*. per quart.—JAMES CARTER, Seedsman and Florist, 238, High Holborn, London.

TO FARMERS.

IN ACCORDANCE with the wishes of Farmers, Millers, and others interested in the Corn Trade, an Edition of the AGRICULTURAL GAZETTE AND GARDENERS' CHRONICLE will be published every Monday Afternoon, in time for post. The Monday's Edition will, in addition to the usual markets, contain a full report of the Mark Lane, Smithfield, and Newgate Markets of the day.—May be ordered of any Newsagent. Price 6*d*.

SUPERB DOUBLE HOLLYHOCKS.

WILLIAM CHATER has now ready a fine healthy stock of young plants of all the leading sorts. For price and description see General List, which also contains hints on their culture, with observations on the exhibition of Hollyhocks, &c. &c., and may be had by inclosing a postage stamp.
Saffron Walden Nursery, January 14.

TROPÆOLUM AZUREUM ... 42*s*. per dozen.
" BRACHYSERAS ... 18*s*. "
" TRICOLORUM ... 24*s*. "
The above are very strong sound roots just commencing their growth, and might with safety be transmitted through the Post Office. Usual discount to the trade when ordered by the dozen.
HUGH LOW & Co., Clapton Nursery, London.—Jan. 14.

BENJAMIN R. CANT begs to offer the following—

12 first class New Show Geraniums, for	...	30*s*.
12 excellent but older kinds of ditto	...	15*s*.
12 good distinct	...	9*s*.

THOMAS SIBBALD, NURSERYMAN and SEEDSMAN, Bishop Auckland, will forward on application his DESCRIPTIVE CATALOGUE OF GARDEN AND FLOWER SEEDS. The stock is selected with care, and may be depended on as being genuine, and of equal quality with any offered.

DAHLIAS.

JOHN KEYNES, FLORIST, Salisbury, respectfully begs to announce that his Annual CATALOGUE of all the NEW and FIRST-RATE DAHLIAS for 1854 is now ready, and will be forwarded on application.
The two new and beautiful Dahlias, "FANNY KEYNES" and "RACHEL RAWLINS" will be figured in the February Number of "THE FLORIST;" and as drawings of these beautiful Dahlias cannot be procured through any other medium than "THE FLORIST," J. K. recommends his friends to order the February Number without delay.
Castle Street Nursery, Salisbury, Jan. 14.

AMERICAN PLANTS.

JOHN WATERER begs to announce that his NEW CATALOGUE of RHODODENDRONS, AZALEAS, CONIFEROUS PLANTS, &c., is now published, and may be had by enclosing two stamps for postage.
The colours of all the Rhododendrons worthy of cultivation are described in order to facilitate purchasers in making selections, together with a Treatise on their successful management.
☞ The Rhododendrons forming the American Exhibitions in the Royal Botanic Society's Garden, Regent's Park, London, are annually supplied from this establishment.
The American Nursery, Bagshot, Surrey, near the Farnborough Station, South-Western Railway, and 3 miles from Blackwater, South-Eastern Railway.

GEORGE BAKER begs to say that his DESCRIPTIVE CATALOGUE of AMERICAN PLANTS, CONIFERS, ORNAMENTAL SHRUBS, FRUIT and FOREST TREES, &c., may be had by enclosing two postage stamps.
G. B. wishes to call particular attention to his fine Stock of GREEN and WEEPING HOLLIES, from 1 to 12 feet high.
G. B. has supplied the American Exhibition in the Royal Botanic Gardens, Regent's Park, from its commencement.
American Nursery, Windlesham, near Bagshot, Surrey, about six miles from Staines Station, Windsor Branch, South-Western Railway, where conveyances may be obtained.

CHOICE FRUIT TREES.

JOHN ADAMS, NURSERYMAN AND SEEDSMAN, Brompton Park, Kensington Gore, London, begs to call the attention of the trade, and planters generally, to his extensive Stock of FRUIT TREES, embracing all the best varieties in cultivation, under their correct nomenclature; but more particularly to his Standard Trained Cherries, Plums, Pears, Apricots, Peaches, and Nectarines; Dwarf Trained Cherries, Pears, Plums, Peaches, and Apples; Standard Cherries, Plums, Pears, and fine large Mulberries; Dwarf Pears, Plums, Apples, and Nectarines, of which he has a large stock, all of first-rate quality.

NEW SEEDS—GROWTH OF 1853.

RENDLE'S COLLECTION OF GARDEN SEEDS, FOR ONE YEAR, *will be sent out as usual by the Subscribers.*

The collections have given universal satisfaction, and they will be found sufficient to supply a garden during the whole of the 12 *months.*

	£	s.	d.
No. 1.—A complete Collection, to supply a large garden for 12 months, including 20 quarts of the newest and most approved Peas, for early, medium, and late crops; 10 quarts of Beans, and full quantities of all other kinds of vegetable seeds	3	0	0
No. 2.—A complete Collection, in reduced quantities, for a smaller garden	2	0	0
No. 3.—A complete Collection do.	1	5	0
No. 4.—A small and choice Collection	0	15	0

For the detailed quantities contained in the No. 1 *Collection, see back page Gardeners' Chronicle, Jan.* 7, 1854.

☞ *All orders above* 20*s. carriage free (see* PRICE CURRENT), *and all orders above* 5*l. delivered carriage free to every Railway Station in England and Wales, and to every Steam Port in England, Wales, Ireland, and Scotland.*

WILLIAM E. RENDLE & Co.,
Seed Merchants,
ESTABLISHED 1786. Plymouth.

The quantities contained in the above Collections will be found in our PRICE CURRENT AND GARDEN DIRECTORY, *just published.*

HAWKES' CHAMPAGNE RHUBARB.—This most desirable variety is now for the first time offered to the public. It has stood the severest test that can be applied, and has beaten everything in Covent Garden and other London Markets in realising higher prices, from its magnificent colour and size. It has been seen by the very highest authorities and pronounced to be a most valuable introduction. In earliness it equals the Prince Albert, but of a deeper colour, and much greater bearer. It forces remarkably well, and is very hardy out of doors. Mr. HAWKES has placed the entire sale in the hands of Duncan Hairs.

One-year-old plants, strong, 5*s.* each. A few two years old, very strong, for sale.

LAING'S MAMMOTH RED CELERY.—This is considered the largest yet grown, attaining the extraordinary weight of from 10 to 12 lbs., and at the same time perfectly solid. It is nearly perennial in its habit, as it will not, under any circumstances, run to seed the first season, and it is difficult sometimes the second when planted out for that purpose. In colour it is a bright red. In flavour unsurpassed if equalled.

It has been seen growing by many practical gardeners, who deem it a new feature in the garden, from the fact that it may be had nearly all the year. Packets 2*s.* 6*d.* each.

MITCHELL'S HARDY EARLY CAULIFLOWER.—This is grown precisely as the handglass variety, but when removed from the frame does not require the same protection, and comes in immediately after. This is particularly recommended for gentlemen's establishments. The head is not large, but handsome and compact, and is so firm that you may let them stand from 10 days to a fortnight and they will not get frothy or loose. This is quite a distinct variety. Packets 2*s.* 6*d.* each.

DUNCAN HAIRS, Seedsman, 109, St. Martin's Lane. Post Office orders to be made payable at Charing Cross.

THE CUCUMBER SEASON.—Growers of this superb and select branch of Horticulture should endeavour to procure seeds of such varieties as will give them satisfaction, and meet every expectation for exhibition or otherwise. The under-mentioned have been thoroughly proved, and testimonials and orders again received from numerous correspondents.

CAPTIVATION CUCUMBER, a beautiful black spine, free from ribs and shrivels, carries its bloom well, fruit never turning colour at the point like many others, length from 20 to 28 inches uniform from stem to point (a consideration to exhibitors), 2*s.* 6*d.* per packet.

PHENOMENON CUCUMBER.—Also a fine black spine, rapid grower, and the hardiest of all long Cucumbers, in other respects similar to the above, 2*s.* 6*d.* per packet. This will give every satisfaction to growers.

Victory of Bath Cucumber, 1*s.* per packet; Winter Cucumber, Lord Keynon's Favourite, 2*s.* 6*d.* ditto; Gordon White Spine, 1*s.* ditto; Chamberlain's Essex Hero (very fine), 2*s.* ditto; Sunderlandwick Cucumber (very fine), 2*s.* ditto; Hunter's Prolific, 1*s.* ditto; and numerous other good varieties, at 1*s.* per packet.

MELONS, the best sorts, true to name, and such as will give every satisfaction.—Tiley's Incomparable, 1*s.* 6*d.* per packet; Tiley's Bromham Hall, 1*s.*; Tiley's Golden Ball, 1*s.*; Tiley's Queen, 1*s.*; Tiley's Bowood, 1*s.*; Victory of Bath, 1*s.*; Camerton Court, 1*s.*; Beechwood, 1*s.*; Windsor Prize, 1*s.*; Emperor, 1*s.*; Fleming's Hybrid Persian, 1*s.*; Hampton Court, 1*s.*; Blackhall's Green Flesh, 1*s.*; Bailey's, 1*s.*; and numerous others.

*** A Packet of each of the first-named Cucumbers, and two packets of either of the Melons named, sent free for 60 penny stamps.

HOLLYHOCK SEED, saved from a splendid collection of all the newest and best varieties out, 2*s* 6*d* per packet.

GERMAN ASTER SEED, from some of the finest flowers ever exhibited, 1*s.* per packet, or a packet of this and of the Hollyhock for 3*s.*

ANTIRRHINUM SEED (SPLENDID), 1*s.* per packet.

A remittance must accompany every order by cash or penny postage stamps, when the whole or any part (as the case may be) will be immediately forwarded.

EDWARD TILEY, NURSERYMAN, SEEDSMAN, & FLORIST,
14, Abbey Churchyard, Bath, Somersetshire.

KILMARNOCK WEEPING WILLOW, OR SALIX CAPREA PENDULA.—The Trustee on the sequestrated estate of Thomas Lang, Nurseryman, Kilmarnock, intimates that he is now ready to supply plants of this beautiful new Willow. Mr. Lang has received numerous testimonials as to its being a new, distinct, and interesting addition to our Ornamental Trees, from Professor Lindley, of London, Mr. MacNab, Royal Botanic Gardens, Edinburgh, and others: but the following letter from Sir William Jackson Hooker, Director of the Royal Gardens, Kew, is of itself sufficient both as a description and a recommendation of the plant.

"Royal Gardens, Kew, Sept. 29, 1853.

"Sir,—The Salix caprea pendula, or Kilmarnock Weeping Willow, is doing well with us, and is much admired for its decidedly weeping character. It bears the same relation to the ordinary Salix caprea that the Weeping Ash does to the Common Ash, and I need say nothing more in its favour. Every branch is gracefully curved downwards, and the great breadth of the foliage and its dark colour give it a totally different character from the common Weeping Willow, Salix Babylonica. I think very highly of it as an ornamental small tree.

"I am, &c. (signed) W. J. HOOKER."

Prices.—Furnished Plants, on own roots, trained to one stem, 2*s.* 6*d.* each.; do. do. extra fine, 3*s.* 6*d.* each; a few plants, grafted on tall stems, 5*s.* each.

☞ Plants will be delivered in London for 6*d.* each additional, and despatched from thence to any address.

Orders to be addressed to Mr. JOHN DICKIE, Seedsman, Kilmarnock, the Trustee, who will also forward, on application, a printed list of the General Nursery Stock, which is now being sold off at extremely low prices. The Trade supplied on favourable terms.

HIMALAYA CEDAR.

MAULE AND SONS beg to intimate to Noblemen and Gentlemen engaged in Forest or Ornamental Planting that they still hold large supplies of this universally admired and fine timber tree, which they are sending out at the below quotations.

CEDRUS DEODARA, 1 year seedlings,	20*s.* per 100,	8*l.* per 1000	
,, ,, 2 years ,,	25*s.* ,,	10*l.* ,,	
,, ,, *1 foot ...	5*l.* ,,		
,, ,, *1 to 2 feet ...	7*l.* 10*s.* ,,		
,, ,, *2 to 3 feet ...	42*s.* per doz.,	15*l.* per 100	
,, ,, **3½ to 4 feet ...	60*s.* ,,	23*l.* ,,	
,, ,, **4 to 4½ ft., extra fine, for Avenues and single planting	80*s.* ,,	30*l.* ,,	

☞ Those marked * are grown in suitable sized pots; those marked ** may be had either in pots or from the open ground.

Large supplies of Taxodiums, Cryptomerias, Pinus excelsa, Abies Smithiana, Cupressus Goveniana, Lambertiana, &c. &c., offered at such prices as will admit of their introduction into mixed forest and other plantations. Terms sent on application.

The Nurseries, Bristol, Jan. 14.

MESSRS. J. AND H. BROWN will forward their New Catalogue of 1854 by post for six stamps; they also offer the following choice Plants and Fruit Trees, which they will forward when the weather permits.

	s.	*d.*

Tropæolum minus coccineum
,, Lilli Schmidt
,, Sheurmanianum
,, Lobbianum
,, Moritzianum, var. ornatum
Venidium calenduloides
Wahlenbergia grandiflora

Fine Flowering Plants of Aquilegia glandulosa, 2*s.* each, or 20*s.* per dozen.—14, Tavistock Row, Covent Garden, London.

TO NOBLEMEN, GENTLEMEN, AND COMPANIES PLANTING.

THOMAS JACKSON AND SON respectfully invite an inspection of their extensive and fine collection of ORNAMENTAL SHRUBS and TREES; they are of fine growth, and in excellent condition for planting for immediate effect. To the undernamed T. J. & Son especially desire attention. Prices may be obtained by letter or personal application.

American Arbor-vitæ, 2 to 10 ft.
Chinese do., 2 to 8 feet, fine
Arbutus, 2 to 5 feet
Aucubas, 2 to 4 feet, very bushy
Cedar, Deodar, 2 to 12 feet, fine
Cedar of Lebanon, 2 to 9 ft., fine
Variegated Hollies, 2 to 9 feet
Green do., 2 to 9 feet
Weeping do., 5 feet stems, fine
Berberis aquifolium, 2 to 3 feet, bushy
Taxodium sempervirens, 3 to 12 feet, fine
English Yews, 2 to 9 feet
Irish do., 2 to 8 feet, very fine
Tree Box, 2 to 7 feet
Arancaria imbricata, 1 to 5 feet, fine
Deutzia gracilis, 1 to 2 feet, fine
Pinus excelsa, 3 to 8 feet, fine
Pinus insignis, 3 to 5 feet
Cryptomeria japonica, 2 to 6 ft.
Taxus pyramidalis, 2 to 6 feet, fine
Laurustinus, 1 to 3 feet, very bushy
Evergreen Oaks, 2 to 7 feet, fine
Portugal Laurels, 2 to 5 feet
Magnolia acuminata, 4 to 10 ft.
Do. grandiflora Exmouth, 2 to 5 feet, fine
Tree Pæonies, 1 to 3 ft., bushy
Chinese Junipers, 2 to 8 ft., fine
Upright Cypress, 5 to 8 ft., fine
Forsythia viridissima, 2 to 4 ft.
Red Cedars, 3 to 5 feet, fine

T. J. & Son having added to their previously good stock of American Plants, about one-third of the entire stock of the Norbiton Nursery, so long famed for its collections of Hybrid Rhododendrons, Azaleas, &c., can now offer on most advantageous terms—

Rhododendron ponticum, 1 to 5 ft., in great variety.
Do. aureum, and the varieties of yellows, 1 to 7 ft.
Do. Smithi, tigrinum, and other scarlets, 1 to 9 ft.
Do. campanulatum and light varieties, 1 to 7 ft.
Azaleas, Indian, American, and Ghent varieties, 1 to 6 ft.
Kalmia latifolia, and others, 1 to 4 ft.

T. J. & Son have a splendid healthy stock of the Sikkim Rhododendrons, of which they will furnish the 12 following fine kinds, in pots, for 63*s.*, viz., Thompsoni, fulgens, glaucum, glaucum nanum, niveum, Falconeri, ciliatum, Edgeworthi, lancifolium, cinnabarinum, ferruginosum, and calycatum.

Fine Fruit and Forest Trees; strong Quick for Fences, and all other kinds of Nursery Stock.—Nurseries, Kingston, near London.

SUPERB LATE WHITE BROCCOLI—"EMPEROR."

EDMUND PHILIP DIXON having purchased the entire stock of the above Broccoli of Messrs. Elletson, Market Gardeners, Thorngumbald, near Hull, begs to announce that after the 1st of January next he will be prepared to send it out in sealed packets at 2*s.* 6*d.* each. This Broccoli has been raised by the Messrs. Elletsons, the raisers of the Mammoth, sent out some time ago, who state that the EMPEROR, if sown at the same time, will come into use before it. Is of very dwarf growth, perfectly hardy, with heads from 15 lbs. to 20 lbs. weight; keeps its colour, and stands firm three weeks after it is ready to cut. A noble flower and commands the best price of any other in the Hull market, where it is well known, and will be a great acquisition to the market gardeners around London, as well as those who wish for a first-rate Broccoli.

May be had of Messrs. NOBLE, COOPER, & BOLTON, 152, Fleet Street; and Messrs. HURST & M'MULLEN, 6, Leadenhall Street, London. Also of the Advertiser, 57, Queen Street, Hull.

IMPROVEMENT OF GRASS LANDS.

SUTTON'S RENOVATING GRASS SEEDS FOR IMPROVING OLD PASTURES.—Many Old Upland Pastures, Parks, and Meadows are nearly destitute of Clovers and the finer and more nutritious sorts of Grasses, in which case we are in the practice of furnishing such sorts only as are wanting. If the Seeds are *sown early in the season*, the improvement in the Pasture will be very considerable, and at a small expense.

The following is similar to many other letters received from former purchasers:—

From D. T. Cunynghame, Esq., Wellesbourne, Warwick, Nov. 1852.

"The meadows that were renovated with your Seeds are looking very well. I cut nearly 2 tons of hay to the acre, and three years ago the same land hardly produced half a ton per acre. The Garden Seeds I have had from you exceed by far any that I have bought elsewhere."

Quantity of Seed required, 8 *lbs. to* 12 *lbs. per acre. Price* 1*s. per lb.*, Carriage Free.—Address

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

N.B.—We have a very fine Stock of Mangold Wurzel and Carrot Seed.

DILCOCK'S BRIDE BROCCOLI.

BAINBRIDGE AND HEWISON (late Jas. Edward), have the pleasure of again offering to their friends and the public their DILCOCK'S BRIDE BROCCOLI, at 2*s.* 6*d.* per packet, each containing 1300 Seeds; and while returning their thanks to their numerous patrons of last season, they beg to refer them to the following extract, taken from the *Yorkshireman* newspaper of the 30th of April last, when it was exhibited at York, for the fourth time:—"Mr. Dilcock deservedly obtained all the three prizes for Broccoli with his seedling—the 'Bride.' Taking the season into account, these vegetables were really remarkable specimens." It was equally successful the two previous years.

B. & H. will be prepared to send out their Catalogues of Kitchen Garden and Flower Seeds for 1854, early in January, post free, on application, and also their Catalogue of Plants early in March, containing Stove, Greenhouse, &c., including many of the newest and choicest of the season. Their Seeds will be of the very best quality, and in the greatest possible variety.

Sold Wholesale by NOBLE, COOPER, & BOLTON, Fleet Street; CHARLWOOD & CUMMING, Covent Garden; and by all respectable Seedsmen in town and country.—York Nurseries, Dec. 31.

CEDRUS DEODARA AND ARAUCARIA IMBRICATA.—The beauty and unique character of the above hardy and most ornamental of all Evergreen Trees are too well known to admit of any comment. Our plants are grown within 500 yards of the wash of the Sea, in this the most eastern point of England, and consequently fully exposed to the gales of the North Sea and German Ocean, which they stand with impunity. It is, therefore, obvious to Noblemen and Gentlemen who purpose planting their Marine Villas, and other exposed situations, that they will not meet with that disappointment so frequently attending plants reared in milder counties. We submit the following scale of prices for robust, handsome, and well-formed plants, either in or out of pots:—

CEDRUS DEODARA... ...	4 to 6 inches	6*s.* per dozen
,, ,, ...	12 to 15 ,,	12*s.* ,,
,, ,, ...	1½ to 2 ft.	20*s.* ,,
,, ,, ...	2 to 2½ ft.	30*s.* ,,
,, ,, ...	3 ft.	42*s.* ,,
,, ,, ...	3½ to 4 ft.	60*s.* ,,
,, ,,	large specimens, 15*s.* to 21*s.* each.	

If 100 or more of the above be taken, a considerable reduction will be made.

ARAUCARIA IMBRICATA ...	4 inches	6*s.* per dozen.
,, ,, ...	1 ft.	30*s.* ,,
,, ,, ...	1 ft. to 1½ ft.	42*s.* ,,
,, ,, ...	1½ to 2 ft.	60*s.* ,,
,, ,, ...	2 to 2½ ft.	80*s.* ,,
,, ,, ...	3 ft, fine,	15*s.* each.

Catalogues will be forwarded free on application. Orders of 2*l* and upwards are delivered Carriage Free to London or Hull, or to any Railway Station within 150 miles of the Nursery.

YOUELL & Co., Royal Nursery, Great Yarmouth.

"FASTOLFF RASPBERRY."—It is with much satisfaction that we announce a third award made by the London Horticultural Society, on 26th of July last, for examples of the above most excellent Raspberry, unequalled by any other variety for the size of its fruit and richness of flavour.

It is reported in the *Gardeners' Chronicle* of July 30th, page 486, as follows:—"Messrs. Youell, of Great Yarmouth, sent a boxful of beautiful fruit of the Fastolff Raspberry; they were unusually fine, and well deserved the certificate of merit awarded them."

Strong well-rooted canes, 15*s.* per 100; Large White Raspberry, 24*s.* per 100; New Monthly Fruiting, 24*s.* per 100.

CHOICE FRUITS. (Warranted true to name.)

APPLES, standard, in best selection, good heads			9*s.* per dozen.
,, dwarf	,,	,,	6*s.* ,,
,, trained	,,	,,	30*s.* ,,
PEARS, standard	,,	,,	12*s.* ,,
,, dwarf	,,	,,	8*s.* ,,
,, trained	,,	,,	30*s.* ,,
PLUMS, dwarf	,,	,,	9*s.* ,,
,, trained	,,	,,	36*s.* ,,
PEACHES, dwarf trained, in fine strong plants,			36*s.* to 60*s.* ,,
NECTARINES, dwarf trained,	,,		36*s.* to 60*s.* ,,
APRICOTS ,,	,,		36*s.* to 60*s.* ,,
CHERRIES, standard, in fine variety ...	...		12*s.* ,,
,, dwarf	,,	... ...	9*s.* ,,
,, trained	,,		36*s.* to 42*s.* ,,

GOOSEBERRIES, 25 of the finest varieties (good bushes), selected for size and flavour, 30*s.* per 100; 4*s.* per dozen.

CURRANTS, improved large white Dutch, Black Naples, Raby Castle (red), and Large Red Grape, 4*s.* per dozen; Knight's Sweet Red, 6*s.* per dozen; these are the most desirable kinds in cultivation, and are highly recommended.

RHUBARB, Myatt's Victoria, 9*s.* per dozen; Royal Albert, 9*s.* per do.; Linnæus, 9*s.* per do.; Tobolsk, 6*s.* per do. (strong).

SEAKALE, extra strong, 2 years, 6*s.* per 100; 3 years, 8*s.* per do.

ASPARAGUS, extra strong, for forcing 5*s.* per 100; 3 years old, 3*s.* 6*d.*; 2 years old, 2*s.* 6*d.*

*** Less quantities than those named above supplied at the same prices. Orders of 2*l.* and upwards are delivered Carriage Free to London or Hull, or to any Railway Station within 150 miles of the Nursery.

YOUELL & Co. beg to refer to their Advertisement of a choice and extensive Collection of Plants which appeared in this Paper of October 15, and for Conifers, October 22. Catalogues will be forwarded free on application. Anemone Seed, saved from selected roots, 10*s.* per lb. The usual discount to the trade.

YOUELL & Co., Royal Nursery, Great Yarmouth.

JUDSON'S
RICHMOND VILLA BLACK HAMBURGH VINE.

ARTHUR HENDERSON AND CO. have the pleasure of informing their patrons and friends that they have good plants of this valuable and much-esteemed Vine at 5*s.* each; extra strong plants, 7*s.* each.

N.B.—For full particulars of the distinguishing characteristics of this Vine, we beg to refer our customers to the *Gardeners' Chronicle* of October 25th, 1851.

HUGH LOW AND CO. have the pleasure to announce to their Friends and the Public that they have now received the greater part of their Stock of Vegetable and Flower Seeds, selected with considerable care from the best growers. They would more particularly recommend their collections of German Flower Seeds, consisting of Stocks, Asters, Larkspurs, Balsams, Zinnias, &c., all which are of the best quality, and imported direct from Erfurth.—Clapton Nursery, London, January 14.

QUICKS! QUICKS! QUICKS!

WILLIAM YOUNG begs to inform Gentlemen, Contractors, and others, that he has a large quantity of extra large Bedded Quicks, besides several hundred thousand of four and five years old Quicks, fine, samples of which, with price, will be forwarded on application. Likewise a quantity of bedded Mahonia aquifolium or American Berberry, for Cover.
Milford Nursery, near Godalming, Surrey.

YORK NURSERIES.

JAMES BACKHOUSE AND SON respectfully inform their friends and the public that they have erected new and much more commodious PREMISES, near the Village of Holdgate, on the west side of the City, and will henceforth carry on their business of NURSERYMEN and SEEDSMEN in all its branches there. The situation is very superior to that formerly occupied in Fishergate, and the distance from the Railway Station nearly the same—about one mile. A large tract of ground being now devoted to the cultivation of Horticultural Seeds, Ornamental Forest Trees, &c. &c., under their immediate superintendence, they believe that they will thereby be enabled more successfully than ever to supply articles of the best quality to all who favour them with their orders.

PYRAMIDAL PEAR TREES ON THE QUINCE STOCK.

J. AND J. FRASER, NURSERYMEN, Lea Bridge Road, Essex, beg to offer the above in fine strong trees, and such as would fruit the first and second year after planting, at the undernamed prices. These Pears are remarkable for their compact style of growth and prolific bearing; the collection comprises the following fine sorts:—Beurré d'Amanlis, Beurré d'Aremberg, Beurré de Capiaumont, Beurré Diel, Beurré Easter, Beurré Grise d'Hiver, Nouveau, Beurré Rance, Williams's Bon Chretien, Crassane, White Doyenné, Duchesse d'Angouleme, Forelle or Trout Pear, Glout Morceau, Hacon's Incomparable, Jargonelle, Louise Bonne of Jersey, Marie Louise, Napoleon, Winter Nelis, and Passe Colmar.—Price 2*s.* 6*d.* to 3*s.* 6*d.* each.

A BEAUTIFUL ORNAMENT FOR THE DRAWING-ROOM.

THE DOUBLE LILY OF THE VALLEY is universally admired, on account of its delicious Fragrance, Elegant Flowers, and Graceful Habit; as a pot plant it is superior to any flower in cultivation, its hardy nature also renders it a suitable ornament for the open garden. One dozen Roots, with directions for their culture both in pots and the open garden, will be sent free by post to any part, on receipt of 36 penny postage stamps.—JOHN J. REID, Monkton Nursery, Ryde, Isle of Wight.

PEAS! PEAS! THE BEST VARIETY IN CULTIVATION.

CHAMPION OF ENGLAND, a blue wrinkled Pea, very productive, of quick growth, and of a most delicious flavour. This extraordinary Pea combines in one the merits of all others, and has none of their demerits; for, although a wrinkled Pea, it is both hardy and early, and being of quick growth, it is the best kind to plant throughout the season for each crop. It is highly productive, bearing very long pods of a lively green, which are well filled, and the Peas are generally as large as small horse Beans, of a deep green colour, and beyond all others of a most delicious flavour. Height, 3 ft. to 3½ ft.

Price, in quantities of not less than 1 peck ... Bag included 6*s.*
" " " 1 bushel ... ... " 16*s.*
" " " 1 sack (4 bushels) " 60*s.*
" " " 8 bushels (1 qr.) " 106*s.*

Delivered, freight paid by Railway to London.
Orders, with remittance or satisfactory reference, will have immediate attention on application to
H. AND A. WALLIS, SEEDSMEN, Ipswich.

T. APPLEBY AND SON, NURSERYMEN and SEEDSMEN, Victoria Nursery, Uxbridge, return their sincere thanks to their numerous patrons during the past year, and beg to inform them and the public in general, that their ANNUAL CATALOGUE of NEW SEEDS is now ready, and will be sent free on prepaid application.

T. A. & SON have a large stock of the finest varieties of Show and Fancy GERANIUMS, which they are prepared to dispose of at reduced prices. A good stock of TRAINED FRUIT TREES yet on hand.

SELECTED GARDEN SEEDS.

We beg to offer the following Collections of Kitchen Garden Seeds, containing all the best sorts of Vegetable Seeds, to stock the garden throughout the year:—

	£	s.	d.
No. 1. A complete Collection, suitable for a large garden	3	0	0
No. 2. A Collection of smaller quantities, but equally choice	1	10	0
No. 3. A choice Collection for a small garden	0	15	0

Nos. 1 and 2 Collections will be sent Carriage Free to any part of Great Britain.

A large quantity of SPRUCE FIRS, 1½ to 6 feet, on sale.
Victoria Nursery, January 14.

CHOICE SEEDS.

BASS AND BROWN'S SPRING CATALOGUE FOR 1854 is now in the Press. The Part containing the SEEDS can be forwarded immediately, on application, for two penny stamps.

PEAS, FINE NEW KINDS, of last and present year's introduction.

Fairbeard's Nonpareil, earlier than Champion of England, and fine rich flavour	5*s.* 0*d.*	per quart.
Waite's Daniel O'Rourke, very early	2 6	"
Sangster's New No. 1, 2½ ft., very early, prolific and fine pods	2 0	"
Stuart's Paradise, 4ft., a very fine large long-podded marrow, three weeks before Thurstone's Reliance, or other Peas of the same character	2 0	"
Hairs' Defiance, 4 ft., a fine new wrinkled marrow	2 0	"

The three last mentioned were grown last season by ourselves, and we can recommend each as an acquisition. Sangster's No. 1 *and Stuart's Paradise will be included in the collections below.*

BASS AND BROWN'S ASSORTED COLLECTIONS OF VEGETABLE SEEDS, comprising the best in cultivation, including several new sorts of excellent quality.

	£	s.	d.
No. 1.—Collection for a large garden, containing 20 quarts Peas, in 20 best sorts, and all other vegetable seeds in proportion, for one year's supply...	3	0	0
No. 2.—Collection in smaller proportions	2	0	0
No. 3.—Collection do. do.	1	5	0
No. 4.—Collection of good kinds for a small garden ...	0	15	0

Copies of the Autumn Catalogues may still be had for three penny stamps.

Goods (not under 20*s.*) carriage free to all stations in London.
Seed and Horticultural Establishment, Sudbury, Suffolk.

PARADISE PEA.

STEWART AND MEIN having received from all quarters the most favourable reports of the above Pea, beg again to call attention to it, and to intimate that in consequence of the generally defective crop of last season, their stock of it is very limited, and they would therefore advise an early application from intending purchasers. Price and other particulars may be had on application. Agents in London: Messrs. Charlwood & Cummins, Covent Garden; and Messrs. Nutting & Sons, Cheapside; and in Edinburgh, Messrs. Lawson & Son, and Messrs. Dickson & Sons.

S. & M. have also on hand Ash-leaved Kidney, Jackson's Improved Ash-leaved Kidney, Shaw's Early, and Chinese Early Potatoes, at moderate prices.
Paradise Nurseries, Kelso, Roxburghshire, Jan. 14.

DISSOLUTION OF PARTNERSHIP.

THE PARTNERSHIP which has existed for thirty-five years between my cousin and myself, as Seed Merchants and Nurserymen in this City, under the firm of "FRANCIS AND JAMES DICKSON," and also in Manchester for upwards of four years, under the firm of "FRANCIS AND JAMES DICKSON AND CO.," has been this day DISSOLVED by mutual consent; and I beg to tender my grateful acknowledgments and sincere thanks to the numerous patrons and friends of the late firm, for the kind and liberal patronage extended to my late partner and myself for so many years, and as I have now entered into Partnership with my Sons, I venture to hope that we may, unitedly, continue to merit a share of that confidence and patronage which I enjoyed for so long a period as senior partner in the late firm.

Our Seed Business will be carried on in the same premises as before, and our Nursery Business at the Upton Nurseries near Chester, under the firm of FRANCIS and ARTHUR DICKSON & SONS.
Chester, Dec. 28, 1853. FRANCIS DICKSON.

SEED WAREHOUSE, 106, EASTGATE STREET.

FRANCIS AND ARTHUR DICKSON AND SONS, in soliciting a continuance of the confidence and patronage enjoyed by the late firm, have only to state that they are determined that every article sent out by them, whether in Seeds or Plants, shall not only be of first quality but shall also be charged the most moderate price; and they further assure their customers and friends that no effort shall be wanting on their part at all times to meet the wishes of those who entrust their orders to them. Their stock of New Seeds for the ensuing season is now complete; catalogues of which will be ready in a few days, and may be had on application.—January 14.

The Gardeners' Chronicle.

SATURDAY, JANUARY 14, 1854.

MEETINGS FOR THE ENSUING WEEK.

MONDAY, January	16	Chemical	8 P.M.
		Statistical	8 P.M.
		Horticultural	2 P.M.
TUESDAY, —	17	Linnean	8 P.M.
		Civil Engineers	8 P.M.
		Pathological	8 P.M.
WEDNESDAY, —	18	London Institution	7 P.M.
		Society of Arts	8 P.M.
		Geological	8 P.M.
THURSDAY, —	19	Antiquarian	8 P.M.
		Royal	8½ P.M.
FRIDAY, —	20	Royal Institution	8½ P.M.
SATURDAY, —	21	Asiatic	2 P.M.
		Royal Botanic	3½ P.M.
		Medical	8 P.M.

IT is now many years since we began to insist upon the paramount importance of as continual an access of air to plants as to animals; and our most intelligent correspondents have from time to time abundantly supported our assertion. Now-a-days we hardly think that experienced men entertain a doubt upon the subject; for it is fully understood that there is as much difference in the health, colour, flavour, and other qualities of coddled plants and those over which free air incessantly passes, as between a pallid factory child and the stout ruddy urchin that is all day running about in the fields.

The fact is admitted; but the difficulty is to secure a copious admission of ever-changing air, without the dryness or the wetness, or the coldness which accompanies it. We have in this case a theoretical certainty in direct and formidable opposition to a practical difficulty, which, indeed, is so great that nine-tenths of the attempts which have been made to overcome it have ended in failure. We want the breath of ZEPHYR, not the gusts of BOREAS or the parching air of NOTUS, or the icy embrace of AQUILO or EURUS.

Perhaps no one has, upon the whole, succeeded more skilfully, on a small scale, in overcoming the difficulty attending this subject than the Rev. T. PHILLPOTTS, of Porthgwidden, near Truro. An account of this gentleman's operations was published in the Journal of the Horticultural Society for January, 1852, with good working plans, which enable any builder to follow his suggestions. At that time results had been obtained which left nothing to be desired. As it will, however, sometimes happen that good and ingenious plans go wrong in the long run from a variety of unexpected circumstances, it was with no little gratification that we received, the other day, from Mr. PHILLPOTTS the following communication:—

"You cannot too strongly urge the necessity of ventilation, or rather of keeping up a constant circulation of air in plant-houses, Cucumber pits, &c., at *this season especially*. A few weeks ago you mentioned that a Cucumber had been cut about the end of November, 18 inches long. On the 13th December we cut one of 23 inches; and I see no reason to doubt that we might do the same at any time. As this was done with a very moderate fire-heat, I attribute it principally to a good system of 'æration,' without which, success is almost impossible. An account of my pits was published in the Horticultural Society's Journal for January 1852, and subsequent experience only confirms my opinion of their efficiency. They have, you may observe, a constant supply of fresh air night and day."

NIGHT and DAY! We hope that these words will not escape observation. To feed plants with good nutritious air all day long and to stifle them at night, is to undo with the left hand all that the right hand has been labouring to accomplish. And yet how constantly this happens everywhere except in the lap of our Mother Nature, where plants are rocked all night long, however gently they may be lulled during the day.

Such a subject as this cannot be too much discussed; and we very much wish that those who have experience, whether successful or unsuccessful, in perpetual æration, would communicate their observations. There is not a gardener in the United Kingdom who would not be grateful for the information, and able to derive some advantage from it.

What, for instance, has been the result of the system of æration by means of underground drains, put in action some years since at Drayton Manor by the late Sir ROBERT PEEL?

AT the time we issued an invitation a few days since to such intelligent cultivators as are in the habit of paying attention to the DISEASES OF PLANTS, to communicate good specimens of morbid changes of structure accompanied by illustrative remarks, we were not aware that a similar proposition had been laid by Dr. ALEXANDER BRAUN before the Horticultural Union of the Royal Prussian States, in the form of a circular from the Agricultural College, accompanied by a request that members of the Union would forward for inspection well selected cases of disease in different stages of development, in order that they might be submitted to microscopic inspection. Dr. CASPARY, who was formerly resident in this country, and paid great attention to its more obscure vegetation, has just forwarded to us some of the results of this proposition in a joint memoir by himself, Dr. BRAUN, and Dr. ANTON DE BARY, the latter of whom has published a very instructive volume on the various species of rust with which living vegetables are affected. Four cases are brought forward, all of which are new, and one of considerable interest, detailing the particulars of a disease with which Heaths, as exemplified in *Erica Wilmoreana*, are affected in winter, and totally different from one to which they are subject at an earlier period of the year, which has been described by Dr. KLOTZSCH.

It is not our intention to enter now into the particulars of the disease, as they will find their proper place in some future communication, but merely to point out one curious circumstance, that the communication has brought to light a very striking instance of a second form of fruit, capable of germination, arising from the spawn of a minute mould, and preceding in order of time the larger and more complicated spores which are the true fruit of the parasite—a fact of the same import clearly as the different forms of fruit which appear in *Fusisporium Solani*, the fungus which is so characteristic of the Potato murrain of MARTIUS. *M. J. B.*

AMONGST other arguments adduced by LIEBIG against the GROWTH OF PLANTS by means of organic matters contained in the water which is absorbed by their roots, is that which asserts that within a given time water cannot contain so much humic acid or humate of lime in solution as is necessary for the increase in weight of plants for that time, supposing that to be the only source of nutriment. This, if correct, would be almost decisive of the point, but it is evident that the data for such questions are, to say the least, very unsatisfactory; and, even supposing the quantity of rain which falls insufficient for the purpose, there is another source of moisture from beneath, by means of the ascending waters of springs which arrive already charged with organic matter; while, moreover, other modifications of humus, easily dissolved in water, are generally present, insomuch that the two before mentioned, taken by themselves, are no proper measure of the nutritious powers of the water which is imbibed.

Another argument, which may be called the geological argument, asserts that plants must originally have derived their nutriment simply from air and water, because humus could not exist before the decomposition of vegetable matter had taken place. It is, however, quite incorrect to suppose that carbon existed only in the air, for it could be supplied in quantities amply sufficient by the bituminous shales, basalts, and lavas. Water, therefore, derived from more or less deep seated springs, could carry a supply of nutritive matter amply sufficient for vegetation, without the necessity of the requisite materials being drawn from the surrounding atmosphere. The proportions of oxygen and hydrogen

moreover, in coal, are quite different from those which would prevail, had the plants of which it is composed been nourished merely by carbonic acid and water. According to URE's analysis it contains from 75-76 per cent. of carbon, 5-8-10 O, 5-6 H, and 1-2 N If, however, it be a hydrated carbon, there must be from 40-48 O to 5-6 H, that is, eight times as much per cent. of oxygen. There is, however, on the contrary, an excess of from 4-5 per cent. of hydrogen, which is quite inconsistent with the notion in question.

Another argument still remains, which may perhaps be called the topographical, deduced from certain facts recorded by DARWIN and others to the effect that in many parts of the world successive crops are borne by land through a long series of years without any accession of manure, and that luxuriant vegetation takes place in soils where no humus exists. Without entering upon any particular instances, it is easy to see that in the former cases there is always an abundant supply of humus, sometimes of many feet in thickness, which gradually imparts its nutritious qualities to the water which either falls upon it or ascends from below, and the cultivation of crops like Maize in dry sand is effected by irrigation, the influence of which depends, in great measure, on the organic matter contained by the water. Besides, the deep land in question after a series of years loses its fertility, and whereas in the sandy soil in which Cocoa trees flourish, the nutriment is derived from beneath, there is an immense difference in the degree of fertility in proportion to the richness of the water in humates. While on some coasts the Cocoa Palm bears fruit in eight years, in proportion as nutriment is deficient the period is deferred, and while in one situation fresh flowers are produced every month, and the produce amounts annually to 100 nuts, in others the production of flowers is much less frequent, and the produce diminished to six or even to two nuts. Many other examples might be brought forward as recorded by BUCHANAN HAMILTON respecting the cultivation of cotton in India, by RAFFLES and JUNGHUHN in Java, by FORTUNE in China, all tending to show the fallacy of those theories of vegetation which would derive the nutriment from air and water alone.

The fertility of soil depends upon its capability of communicating to the water with which it is more or less saturated, those matters which are requisite for the nourishment of plants, and in due proportions. The insolubility of the ulmin of turf renders it unfertile, while matters too easily soluble would supply more nutriment than could be borne consistently with health, and cause a wasteful expenditure by percolation. Plants require for their proper nutriment a very attenuated solution, insomuch that perfectly limpid water may contain a sufficient quantity of humates for all the purposes of vegetation. It is in consequence of the highly attenuated state in which nutriment is received that plants are endowed with such amazing powers of evaporation, which is so excessive in the case of *Pistia Stratiotes*, that the negroes of Guinea keep it in their houses in vessels filled with water, for the purpose of cooling the air.

Several other matters are brought forward by Dr. SCHULTZ in corroboration of his argument, as the easy conversion of humus into gum and sugar, the analogy of humates to many of the products of vegetation, the facility with which humus is obtained from sap, &c., to which we cannot now advert particularly. We shall mention only, in conclusion, the fact connected with the first of these points, of the far greater success which attends the cultivation of Sugar Beet and Vines in soils which are black with humus—in both which cases the formation of sugar is the main object. In light-coloured soils, though the immediately apparent produce may sometimes be greater, the sugar is less in quantity, and consequently the wine weaker. One of the best manures for Sugar Beet is turf which has been well exposed to the action of air, while ammonia and fresh animal dung prevent almost completely the formation of saccharine matter.

VEGETABLE PATHOLOGY.—No. II.

1. HISTORICAL.—Those plants by the cultivation of which the common comforts and necessities of man are principally supplied, are subject to so many diseases, the consequences of which are so fatal to the interests not only of the cultivator but of society in general, that it was impossible, even in the infancy of agriculture, that they should fail to attract very general notice. We find accordingly in the earliest records various indications on the subject confirmatory of the great truth in which the religious man finds his most certain ground of confidence, while the sceptic regards it as an excuse for doubt, "that all things continue as they were from the beginning of the creation." The blasting and mildew in the corn, the casting off of the young fruit of the Grape, of the flowers and fruit of the Olive, the stinking Grapes which belied the hope of the Vine-dresser, the barrenness, badness, and casting of the green Figs, are all so many indications of affections to which the several plants are subject now. In ancient Rome, again, so fearful were the ravages among the crops, that an especial Deity was erected, according to their custom, whose wrath might be deprecated, and her protection sought. It would be an easy matter to select passages from the earlier and later Greek and Latin authors, either occurring incidentally or in works expressly devoted to the subject of vegetables, illustrative of the matter before us, but at present it would be quite out of place to do so. The revival of literature in the middle ages brought with it but few just views on such matters, nor indeed was it to be expected that very sound and tenable opinions should be held on points which even now are subjects of dispute, so long as all the absurdities of animal pathology, which were current up to a very late period, were received with undoubting favour. The subject, however, taken as a whole, did not at a comparatively later period excite much interest amongst men of science, and even up to the present day, except as regards particular affections, the list of works is meagre almost beyond conception. Till the beginning of the 18th century we can find nothing but a very few scattered notices of particular diseases. During the course of the 18th century itself, beginning with 1708, we have Academical Dissertations, or short pamphlets by Zwinger, Eysfarth, Hasselbom, Bring, Seetzen, and a larger work by Zallinger,* with a slight admixture of tracts on particular subjects, amongst which one of the most important towards the close of the century is that of Forsyth on the diseases of fruit and forest trees. At the commencement of the 19th century appeared the important work of Re, with which our readers are well acquainted, from the translation which has appeared in our pages. It was the first attempt at a system of classification, and though relating to many objects, on which we are in this country very imperfectly informed, it is throughout full of interest, and may still be read with advantage. At the same time with the first edition of Re, appeared that of Werneck, on the diseases of plants and their remedies, consisting of a few pages only, and bearing principally on points connected with the culture and treatment of forests. In 1833, Turpin published his notions on vegetable nosology, always harping on his one idea of the important part performed by chlorophyll, or as he calls it globuline, not only in the formation and increase of vegetable tissues, but in the production of certain diseases; and in the same year Unger printed his remarkable treatise on the eruptions of plants, in which, after the manner of so many of his countrymen, he strove to make it appear that the organisms by which they are accompanied, or rather caused, are mere modifications of the cellular tissue of the matrix, or the spontaneous development of matter with which the intercellular spaces are gorged. In 1846 Raspail gave his work on the "Natural History of Health and Disease in Vegetables and Animals," with a view, however, principally to human pathology. Previously to this, in 1839, an article by Moretti appeared in "Bibliotheca Agraria," tom. XXII., and in the same year a formal treatise of considerable merit by Wiegmann, in which the diseases of vegetables are arranged according to their functional effects; viz., 1, those which affect the system of nutrition; 2, those which affect the organs of respiration; 3, those which affect the organs of reproduction. Two years later a very important, but unhappily imperfect and posthumous, work appeared from the pen of Meyer, in which diseases are divided into external and internal. Even in its present form it must be regarded as a valuable contribution to the subject, though confined principally to the description of disease, forming, in fact, only part of a complete whole which he had in view. Finally, in 1847, a small pamphlet appeared, containing the substance of a lecture by Regel on the influence of external agents on the life of plants, which places many matters in a very clear and interesting light, and of which the author of the present series of papers has availed himself in the short article on the Diseases of Plants in the Encyclopædia of Agriculture.

It is not pretended that the list above given is at all complete; it, however, contains the principal sources from which general views on the subject can be obtained, though hundreds of separate memoirs might be quoted treating on particular points, and some, like those of Knight, Decaisne, Payen, Schleiden, &c., containing matter of the greatest import on the subject of vegetable pathology in general.

The researches of the last ten years on the true structure of the cellular tissue in plants, as ascertained by the improvements, not only in the microscope, but in organic chemistry, have more especially tended to throw light on many points which were before obscure, and give hopes that the day is not far distant when vegetable pathology will stand upon as firm ground as animal pathology. *M. J. B.*

EXTRACTS FROM A REPORT FROM DR. ROYLE TO MR. KENNEDY ON THE USEFUL PROPERTIES OF THE DEODAR AS A TIMBER TREE.

(From 31st Report of Commissioners of Her Majesty's Woods and Forests; Appendix No. 19, M.)

HAVING heard, much to my surprise, that doubts are entertained by some respecting the goodness of the Deodar as a timber tree, I have been induced, though considering it unnecessary, to inquire again into the facts upon which the general, but opposite opinion has been formed. These I beg to be allowed to bring to your notice, as you are making arrangements for planting the royal forests with this magnificent tree. The Court of Directors of the East India Company have now for several years introduced Deodar seeds into this country from their botanic garden at Saharunpore, near the foot of the Himalayan Mountains, in consequence of its having been considered a valuable acquisition for this country. These seeds have been freely distributed to landed proprietors, as well as to nurserymen, so that the tree, from being one of the most rare, is becoming one of the more common of the imported kinds. Mr. Loudon, in his Arboretum, in the year 1838, quotes the plants as being sold for 2*l.* 2*s.* They are now obtainable for 6*d.* a-piece. This tree is everywhere admired for its beauty, and valued as a hardy evergreen. I hope it will be still more esteemed for the goodness of its timber.

The Deodar or Devadara (so named from Deva, a deity, and Dara, timber), called also Kelon, is one of the sacred trees mentioned in the ancient hymns of the Hindoos. Hence the inhabitants of different parts of India are apt to apply the name to trees indigenous in their own districts. There is no doubt, however, that the true Devadara of the Shastras is a tree of the Himalayan Mountains; but there the name has been applied to two distinct trees, one a Cypress and the other the Pine, which is the subject of this communication, and which is the true Deodara. It is so called by the natives of several districts in the Himalayas, and was known to Avicenna 800 years ago, as I have stated in my Hindoo Medicine, who mentioned it by the name Duidar as an Indian Pine, yielding a kind of turpentine, perhaps tar or Cedar oil, which the Cypress does not do. The tree is the Cedrus, or Abies Deodara, of botanists.

Some discussion has, I observe, lately taken place respecting the Deodar as to whether it is specifically distinct from the Cedar of Lebanon. This is a revival of an old opinion: Major Hodgson, when surveying the Himalayas, promulgated this idea, which was adopted by Captain A. Gerard; but neither could have had any materials for comparing the Deodar of the Himalayas with the Cedar of Lebanon. Though both plants are now common in this country, the former has not yet attained maturity, and therefore no good comparison can be made, until it has flowered, and formed its cones. In habit and general appearance nothing can be more distinct than the two trees, considering that they are considered by some to be so nearly allied. I myself do not believe that any sowing of the seeds of one plant will produce the other. Besides which, the cones of the Deodar differ from those of the Cedar in this, that they cannot be prevented from falling to pieces, the scales and seeds falling to the ground immediately they are ripe, so that, even to retain them as specimens, we are obliged to envelop them with a netting, while the cones of the Cedar of Lebanon remain for months upon the tree, and may be kept for years after they have been detached, and are even then with difficulty separated into pieces and the seed extracted. This identification with, or difference from, the Cedar of Lebanon as a species, might be considered immaterial, for the Deodar still retains its own peculiar and beautiful habit as a tree; but it seems to have been inferred, that as the Cedar of Lebanon is indifferent as a timber tree, it is probable that the Deodar is not better. But Dr. Lindley has well observed, "that no inference can be legitimately drawn from the supposed relationship of it (the Deodar) to the Cedar of Lebanon is sufficiently shown by the Scotch Pine and the Pinaster: they are also nearly related, and yet the old timber of the first has great durability and strength, while the latter is at all ages worthless for any purpose except firewood." "A similar, but more striking contrast is offered by the Pinaster and Pinus hispanica species, surely more nearly allied than the Deodar and the Cedar of Lebanon." He has further observed of the Deodar, "that it is an evergreen tree of singular beauty, perfectly hardy in these latitudes, the value of which cannot be over-rated, whether it be regarded as a nurse, most useful for protection and profitable for thinning, or, according to the testimony of those who were familiar with it in India, strong and durable as timber."

Before proceeding to adduce testimonies respecting the nature of the timber, it is desirable to take some notice of the natural sites and climates in which the Deodar grows and flourishes. Major Madden, who has written expressly on these Himalayan Coniferæ, describes the Deodar as found on the higher parts of these mountains, from Nepal to Cashmere, at elevations of from 5500 to 12,000 feet above the sea, but to be seen in perfection near the snowy range and lofty mountains of the interior, where for nearly half the year it is enveloped in snow. It seems very indifferent to site and substratum, flourishing equally amongst the clefts of the most scarped rocks, gneiss, quartz, limestone, granite, clay, and mica slate, as in the black vegetable mould of the brae or glen, provided always the surface of the latter slope to an angle sufficient to ensure thorough drainage. The climate of the various localities differs much at different seasons of the year; for from March to the middle of June there is considerable dryness in most of the situations where it is found; from the middle of June to the middle of September there is a cloudy atmosphere, almost continuous rain, and great moisture of the climate. In

* A translation of the work of Zallinger, in German, appeared as late as 1809.

autumn there is fine clear weather, but in winter heavy falls of snow occur; with great reduction of temperature at the higher, and down to the freezing point of water at the lower elevations. So that there are great vicissitudes of climate, not only with regard to temperature, but also in reference to dryness and moisture, which account for its being able to bear so well the extremes of temperature, as well as of moisture, from one end to the other of the British Isles, as I long since anticipated would be the case in my Himalayan Botany, pp. 42 and 350. In its natural sites the Deodar attains a great size both in diameter and in height. On lofty mountains and near the sources of the Ganges, forests of this tree may be seen from 15 to 20 feet in circumference; several have been measured 33 and 36 feet in circumference, 4 and 5 feet from the soil. Some trees that had fallen have been measured, and found to be 160 feet in length; others have been calculated to be 180, and even 200 feet in height.

This gigantic, and at the same time most beautiful of Pine trees, being common near Gungotree, the reputed source of the Ganges, might easily come to be esteemed a sacred tree. But though it might on this account be at first selected, it would not continue to be employed as a timber tree, unless it possessed some valuable properties. The natives, however, of the Himalayas, having within their reach every variety of tree and its timber, select that of the Deodar, and prefer it to all others for the construction of their houses, temples, and bridges. They appear fully justified in their preference, as may be seen from the testimony of European residents and travellers. Many of their houses and temples are built on a plan which, though most trying to timber, is yet well calculated to show how capable the Deodar is of bearing all the vicissitudes of the Himalayan, and therefore, probably, of any other climate. It is used not only as timber is commonly used, under cover, but for the verandahs and the roofs, as well as for the external frame-work of their houses. This frame-work is first made, and then the interstices between the timbers are filled up either with hewn or unhewn stones, so that the wood is exposed as much as the stone, as well to the influence of wet as to cold and drought. Their bridges are wooden bridges, formed by Deodar timbers overlapping each other until they meet in the centre, the other ends being steadied by being sunk into the banks, and kept down by great weights. In Cashmere the Deodar is also employed for making the piers of the bridges on which the arches rest, as well as for building houses and mosques. It is evident, therefore, that the people must have considerable experience respecting this wood, and that the impressions of Europeans who have travelled in these mountains and seen these various buildings, may be considered to have some weight.

Taking them in the order in which they have written, I may first mention Mr. J. B. Fraser, the earliest British traveller in the Himalayas. He writes of the Deodar—Edinburgh, 16th May 1853, "It is a tree that must strike all travellers with admiration, and is certainly used throughout the districts I have known for the purposes you allude to, wherever durability was a desideratum. My impression is, that all the old wooden temples, houses, &c., were built of it, and that it was generally regarded as imperishable. I have not a doubt that, when fully grown, its wood (that is, the fully ripened heart-wood) will be found as lasting as that of any known tree, quite equal to, if not surpassing, the Cedar of Lebanon, which it so much resembles, and superior to the Larch, which, when old, is known to be so durable. Colonel Hodgson, the first surveyor of the Himalayas, describes the Deodar as "the largest, most noble and durable of all trees."

Moorcroft, who was a careful observer and trustworthy narrator, says, "the most valuable tree of Cashmere is, however, the Deodar, a variety of Cedar, the timber of which is exclusively employed in the construction of houses, temples and bridges; pieces of it from the Zem-al-Kudal bridge (over the Jelum) were found little decayed, although exposed to the action of water for 400 years." In his Journal, as quoted in Lambert's Pinus, he also says, "that a building erected by the Emperor Akbar was taken down, and its timber, which was that of the Deodar, was found to be so little impaired as to be fit to be employed in a house built by Rajah Shah." Its age, it was calculated, could not be less than 225 years. He also mentions a building with dome of excellent brick and mortar work, in which was buried the mother of a sovereign who began to reign in A.D. 1417, and died in A.D. 1473. In this building pieces of Deodar were let into the walls, by way apparently of strengthening the bond, and their ends or sides were left on the same plane with the brick-work. This wood, though so much exposed to the influence of the weather, was neither crumbly nor worm-eaten, but was jagged, from the softer part of the wood between the plates or ribs having been often washed by the rain, though its structure had not been attacked by the worm." Further, in his travels, vol. ii. p. 121, he describes the great Jumma Musjid of that city, built by Aurungzebe, as entirely constructed of Cedar: "Such also is the durability of the Deodar, that in none of the columns was any vestige of decay from exposure or insects to be discovered, although they have been erected above a century and a half, and have received for some time past very little care or attention."

Mr. Vigne also, in his travels, writes, that "in Cashmere, bridges, boats, and musjids are built of the imperishable Deodar." *See a musjid built of Deodar.* Vigne's Travels, I. p. 269.

Lord Elphinstone and Mr. Hardinge, still more recent travellers, I am informed by the Hon. Leslie Melville, bear the same testimony to the durability of the Deodar, especially adducing the fact of almost all public buildings in Cashmere being constructed of it, and referring especially to the very tall pillars in the principal mosque being of Deodar wood; also to a much older mosque, of very curious architecture, which is built entirely of Deodar wood. This is said to have been constructed at the latest in our fifteenth century. The same parties refer to the great esteem in which the Deodar is held as a timber in Nepal. Both these valleys, it may be observed, are moist in climate.

The late Sir A. Burnes, in his Travels, Vol. I. p. 50, says, when at Pind Dadun Khan, "The frameworks of the houses are made of Deodar Cedar, which is floated down with the inundations of the River Jhelum or Hydaspes from the Himalayas. The durability and fragrance of the wood recommend it for buildings of every description."

Major Madden writes, "In the walls of temples in Kunawar beams were pointed out to me, showing no signs of decay, except being a little charred and blackened on the surface by the action of the sun and weather, and these temples were said to have been built from 600 to 800 years ago. This is probably an exaggeration; but Captain P. Gerard lived in a house at Summer Kot, between Rooroo and Rampore, the property of the Bissehur Rajah, and ascertained to be 200 years old, in which the timber was as sound as the day it was cut. It is in great request for the walls and roofs of temples and houses, and for granaries, chests, and other purposes, where the ravages of insects, &c., are apprehended." The climate of Kunawar, it should be added, is a dry one. Of the timber of the Deodar Major Madden writes, generally, that it is held in the highest estimation in the Himalayas, being considered almost imperishable, and peculiarly exempt from the attack of worms and insects. It has the advantage of requiring little or no seasoning, takes the saw kindly, but will not split into planks. Its only defect for building purposes lies in its being extremely inflammable, and, on this account, brands of it are often employed as torches."

I will conclude these several favourable testimonies with a note from Lieut.-Colonel Tait, C.B., to the Hon. W. Leslie Melville, and an extract from a report by Dr. Jameson, both of whom have had most recent experience of the Deodar as a timber tree, the one for house and the other for boat building. Colonel Tait writes, 30th April, 1853, "You yesterday asked some questions regarding the Deodar Pine as to its durability. When in Cashmere, I found the bridges over the River Jhelum, at the town of Terrienuggur (the old capital) built entirely of Deodar. Even the piers on which the arches rest are composed of large blocks of this wood; and, from the constant rising and falling of the river, they must be exposed alternately to the action of water and to the burning heat of the sun, as well as to intense cold in winter; and these bridges are known to have existed for an immense number of years, and may have been built centuries ago. They appear never to have had aid from painting. In all the old temples in Cashmere, where wood is employed, the Deodar alone is used, and the antiquity of some of the temples is very great indeed. When my regiment was ordered to be cantoned at Jhelum, in the Punjab, after the last campaign, we had to build houses for ourselves, and lines for our men to live in. I procured the Deodar timber from the hills bordering on Cashmere, as being considered the kind of wood best adapted for building purposes, both on account of its durability, and as being less likely to suffer from white ants."

Dr. Jameson, Superintendent of the East India Company's Botanic Garden, in a report on the Physical Aspect, Agriculture, Botany, &c., of the Punjab, dated 5th October, 1851, says of the wood of this tree, "Of all coniferous trees met with in the Himalayas, the Deodar is most valued for its durability and wood, which is compact, rather close grained and long-fibred, highly resinous, and giving a delicious perfume to the air. For both naval and architectural purposes it is admirably adapted, owing to its strength and great durability, it lasting for numbers of years, even though much exposed to the elements, and being but little affected by water. On the banks of the Jhelum, Chenab and Ravee Rivers, extensive boat manufactories exist, and the following are the prices asked: for boats completely built of Deodar, 1400 to 1500 maunds (that is, from 114,800 to 123,000 lbs.) measure, 1200 to 1500 rupees. A boat of 1400 or 1500 maunds, outside Deodar, and lined with Cheel (that is, the wood of Pinus longifolia), 1000 to 1200 rupees. A boat of 400 to 450 maunds, outside Deodar, and lined with Cheel, 250 to 300 rupees. A boat built of Deodar will last from 20 to 30 years." In his concluding remarks, Dr. Jameson further says, "In the foregoing observations we have briefly noticed all the species of coniferous trees met with in the British Himalayas, pointed out that the Deodar (Cedrus Deodara) is most valuable both for ship-building and for architectural purposes. The only timber fitted for spars for ships is the Deodar, all other being either too soft or too easily acted on by the weather; that timbers of the Deodar, of the dimensions (80 to 90 feet in length) wanted by the ship-builders in Bombay, as stated by the Superintendent of Marine (July 1844, No. 498) could not be transported from the British Himalayas with advantage, owing to the rugged and inaccessible nature of the country, and the difficulties caused by falls and rapids existing in the Sutlej. On the banks of the Beas but few Deodar timbers, comparatively speaking, exist worth exporting."

The foregoing testimonies in favour of the wood of the Deodar might, I believe, be easily multiplied by consulting several other officers who have travelled in, or have been on duty in the Himalayas; but this appears to me unnecessary; for in reply to my inquiries, I have obtained only uniform and unvarying testimony in favour of the wood, and consequently of the great value of the Deodar as a timber tree.

It is much to be regretted that no good specimens of Deodar wood are attainable in this country for experiment; I myself possess only a small piece, which, from its appearance, would seem to have been cut from the outer, and consequently younger part of a tree, and therefore not calculated to give a fair idea of the mature wood. A large piece of the Deodar, which was being sent to the Great Exhibition of 1851, unfortunately fell into the River Hooghly as it was being hoisted into the ship with other timbers. Dr. Jameson has reported that several thick planks, 20 feet long, and cut from a tree 5 feet in diameter, have been despatched from the Saharunpore Botanic Garden to the India House. In the meantime we may refer to the reports which Major Madden quotes, and which were chiefly made by engineer officers in India. But he first mentions Mr. Mines, apparently a practical man, as giving the following opinion of the Deodar wood: "It has a peculiar odour, so that no insect will touch it; the grain is open and straight; it is not liable to warp, even in thin boards exposed to all weathers, and may, in a word, be considered the best wood of its class in the world. Like all other woods, if cut young, it will soon decay when in contact with much damp."

The Deodar had been said by some one to be inferior to the Cheer, another Himalayan Pine tree (P. longifolia), in resisting pressure at right angles; but Major Abbott, of the East Indian Company's Engineers, gives Cheer 593 and Deodar 760 as the relative strength of picked specimens of these two woods. Captain W. Jones, of the Bengal Engineers, found the specific gravity of the Deodar on an average of 20 trials to be 680. He further submitted the Deodar wood to careful experiment, and states that pieces of seasoned Deodar wood 4 feet in length and 2 inches in breadth, broke with weights of 1588 lbs., 1636 lbs. and of 1540 lbs.; that is, pieces of good straight-grained wood; while pieces of 8 feet long, 2½ and 3 inches thick, broke the cross-grained with 1092 lbs., the fine-grained at 1188 lbs. and 1700 lbs.; but that knotty pieces broke at 750 and 964 lbs., while specimens of the same length and thickness, but which had been cut only one month, broke at 829, 908, 964, 1116, and 1028 lbs., the two latter from the heart of the tree, the others from the outside of the tree.

Having taken all reasonable pains to inquire into the opinions of others who have had opportunities of judging correctly of the nature of this wood, I think I am justified in concluding what I have long thought, that the timber of the Deodar, from fineness of grain, strength, and durability, is not only one of the most valuable of the Himalayas, but as good as any other of its class in any other part of the world. Its durability is probably owing to its being so thoroughly imbued with resinous matter, which, though diffusing rather an agreeable odour, of course increases its inflammability. The wood is fine enough in grain to allow furniture, chests of drawers, and even writing desks to be made of it. It is strong enough to be employed for the vertical pillars of mosques, and not only for the piers, but also for the horizontal beams of wooden bridges. It bears exposure to the wet, dry, and cold seasons of the Himalayas when employed for the roofs, verandahs, and the outer framework of houses and of temples seemingly without injury for ages; while boats made of it float on the Sutlej for 20 and 30 years. There seems therefore no doubt of the Deodar being fit for all the purposes to which any of the Pine tribe are applied in Europe. If required, it may form the "mast of some great Admiral," be probably as good as the Larch for building the hulls of ships, and better than the much used yellow Deal for spars.

The great precaution required in planting this, as in other timber trees, is to avoid planting it in too moist or too rich a soil when it is required for timber. It would be proper, indeed, to select well-drained sites, on the steep and barren acclivities of hills. With respect to climate, there are few parts of the British Isles where it will not succeed, as it already flourishes as far north as Forres; so that we may hope to see everywhere continuous forests of "the Deodar of young Gunga," that is, of the sources of the Ganges, or, as Colonel Hodgson calls it, one of "the gigantic sons of the snow."

BALSAMINA LATIFOLIA ALBA.

If it cannot be said of this Balsam that it is one of the most beautiful plants which we possess, it certainly is one of the most useful, for it is perpetually in bloom, forms specimens of good size in a short time, and is so easily managed that even the most inexperienced grower could scarcely fail in its cultivation.

If afforded a gentle bottom heat, cuttings made of firm pieces of the wood emit roots freely; they should be planted in sandy soil, covered with a glass, placed in a shady situation, and not allowed to droop. When sufficiently rooted to bear handling, pot them singly in small pots, and replace them in a close moist warm situation, shading them from direct sunshine till they get established in their pots; then give air more freely and pinch out the tops in order to obtain a bushy plant.

Shift into 6-inch pots, and get them strong well established plants in these before winter. To effect this the cuttings need not be put in earlier than June. The young plants should be placed near the glass in a house where the temperature may average about 50°, giving no more water to the soil than will keep the foliage in health. Towards March, or earlier if required, remove them to a warm house, placing them where they will receive all the light possible; and give a liberal shift, using good, rich, turfy loam, leaf-soil, and thoroughly decayed cow manure, in about equal proportions, well intermixed, adding sufficient sharp sand and lumpy pieces of charcoal to keep the compost open and porous, in order to ensure the free percolation of air and water through the mass. Peg down the shoots, and as they advance in growth stop the stronger ones, keeping the leading shoot tied up to a stake and regulating the others so as to obtain nice well-furnished pyramidal specimens. Give a free supply of water to the soil, and keep the atmosphere moist; syringe the plants over-head morning and evening, and if green-fly makes its appearance fumigate with tobacco. As the plants advance in growth, more pot room will soon be wanted, and the second shift should be into the flowering-pots, the size of which must be regulated by the size which it may be desired to have the specimens. With a light, warm, airy position the plants will make very rapid growth, and soon form large handsome specimens. Discontinue stopping a few weeks—say three—before the time you may wish to have your plant in bloom; and except pinching out the point of any shoot which may incline to so far outgrow the others as to spoil the form of the specimen, stopping should not be practised after the plants are considered large enough for flowering. By keeping them in a light, sufficiently airy position while in bloom, they will grow slowly, forming short-jointed wood, and retaining a compact bushy habit; and as a constant succession of blossom depends upon securing a regular development of healthy young wood, it is of importance to provide for this, which will be best done by placing the specimens while in bloom where it will be convenient to regulate the admission of air, &c., according as the state of the plant may indicate.

With attention to the above remarks, a somewhat close part of the greenhouse will be found a very suitable position for those blooming during summer; but if it should be desirable to prolong their flowering into autumn they must be removed into an intermediate house, when cold damp weather occurs. Give a liberal supply of water at the root, and clear weak manure water may be given once or twice a week with advantage to such as are at all pot-bound.

I may add that it is useless to occupy space in winter with large plants of this Balsam, therefore attend to keeping up a stock of young ones, and throw old specimens to the rubbish heap after blooming. *Alpha.*

Home Correspondence.

Sequoia sempervirens and gigantea the same.—I am well acquainted with every part of the country trod by Douglas. Douglas's journeys seldom exceeded 30 miles from the coast, and it he visited the grounds in latitude 38° 15′ N., the only Coniferous tree he could have seen for 20 miles from the coast was Taxodium sempervirens, some scattered specimens of Abies Douglasi, and Pinus Edgariana. From 20 miles from the coast eastward to an elevation of 1000 feet on the Sierra Nivada, scarcely a coniferous tree of any kind exists. Hartweg travelled over Douglas's tract from south to north, and never saw Wellingtonia, from which I venture to say that that plant was never found except in the locality stated in the *Chronicle*, which is more than 160 miles from the coast, and full 120 miles from Douglas's track. The tree alluded to by Douglas is unquestionably the Taxodium sempervirens of Lambert, or Sequoia of Endlicher, which he must have seen in great abundance both on the mountains of Santa Cruz and of Santa Lucia. From my own knowledge of this tree, it abounds along the coast from latitude 35° 20′, to Humboldt in latitude 41° North, which may be its northern limits. It occupies the deep, gloomy ravines of the western slopes of the mountains, rarely on the east sides, and seldom beyond the elevation of 2000 feet above the level of the sea. Taxodium sempervirens is the largest tree I saw in California, before the discovery of Wellingtonia; it presents to the eye all the beauty and grandeur that Douglas has described. I have often seen trees 300 feet high, and from 10 feet to 15 feet in diameter. *W. Lobb.* [It will be seen from this statement that we were right in regarding Wellingtonia as different from the plant described by Douglas. Sequoia gigantea must now be erased from catalogues, it being a non-entity.]

Seedling Larch.—Persons are not sufficiently careful in the choice of seedling trees. I have 7 acres of Larch on a hill looking north, and which I have vigorously thinned, and yet every other has the rot; in many cases the wood has grown round the rotten part vigorously. I attribute this rot, in a place otherwise well adapted to Larch, entirely to the seedlings having come from some rich or confined or low ground. *Constant Reader.* [We must question this conclusion.]

Johnson's Almanac: Trade Directory.—Mr. Johnson having advertised in your columns that his Almanac contained a "correct list" of nurserymen and seedsmen in England, and my business lying, as it does, exclusively with that branch of gardening, I purchased a copy, and was much disappointed at finding such an incorrect and false statement of names and addresses inserted in its directory. Several of the principal firms are altogether omitted, and many persons who have left the country, or are dead and have been so for many years, have still their names continued in it, making it perfectly useless to me, and I think it only justice to others situated like myself, to give publicity to the fact. My doing so may also possibly be the means of inducing a more correct list to appear in his next edition. *J. Edmonson, Wells, Somerset.*

Weather in Dorsetshire.—

1853 Date.	Cold of the Night.	Thermometer at 9 A.M.	Rain Gauge.	Heat of the Day.	Thermometer at 9 P.M.	Barometer.	Wind.	Observations.
Dec.								
12	25	29	...	38	30	29.5/10	NE	Cold; dull day.

24	27	30	.6	33	29	29.7/10	NE	Clear morning; variable day.
25	21	25	...	31	23	29.9/10	NE	Clear.
26	17	20	...	31	30	29.9/10	NE	Clear.
27	23	23	...	...	...	29.7/10	W	Clear; sprinkling of snow on ground.
1854 Jan.								
1	21	21	...	30	25	29/10	W	Clear; snow; 1½ in. more.
2	25	29	...	35	20	29	SW	1½ in. more snow.
3	19	23	...	30	29	28.8/10	NE	Cold snowy stormy day.
4	26	27	.45*	32	30	28.5/10	NE	Stormy night; snow much drifted.
5	23	25	..	35	31	28.5/10	N	Clear morning; depth of snow in all 8½ in.—sleet.
6	21	23	...	34	31	28.7/10	SW	Clear.
7	29	37	.50†	41	36	28.6/10	W	Stormy and wet.
8	25	37	.43	41	34	28.6/10	SW	Clear.
9	33	35	.6	35	...	28.7/10	W	Overcast; showers.

* Snow-water. † Snow-water.

Until these last few days, the most remarkable feature of this month has been—the ground continuing soft under foot, with the thermometer so low. *W. F. S., Melbury, Dorset.*

Weather in East Suffolk.—

1854. Jan.	Temperature. Max.	Min.	Mean.	Observations.
1st	23	8	15½	Bright morning, snow storms at times during the day.
2d	29	14	21½	Bright morning, alternately bright and stormy during the day.
3d	27	21	24	Bright morning, snow storms with stormy wind in the evening.
4th	27	25	26	Dull day, violent S.E. winds, with some snow storms.
5th	29	27	28	Dull day, sleet and rain, wind very changeable.
6th	33	24	28½	Dull day, some showers, westerly winds
7th	36	30	33	Morning very changeable, afternoon heavy rain.

W. Breadley, Somerleyton Hall, Lowestoft.

Cuthill's Black Prince Strawberry. — Permit me to say that this variety has again proved, with me, to be the best for early forcing, as I have this day (Jan. 3) gathered a dish of fine fruit, and I have likewise a quantity well set. The blooms appear in succession, and I expect that I shall be able to gather continually from it for the next two months. *Wm. Brown, Waltham Abbey, Essex.*

The Barbarossa Grape.—I have read Mr. Cooper's excellent letter on this subject in your number of Saturday last, which may very probably clear up the real name of this unquestionably valuable Grape. On perusal of the list of Vines sent from Italy, I find the name of Barbarou (Dunal) and Barberousse (Dunal)—is this, therefore, the "Barbaroux" which Mr. Cooper asserts is mentioned by Miller? I am inclined to think it must be, though there are many Vines with far more gigantic bunches, as any one who has travelled in the autumn in the sunny south can testify. I should very much like to hear of any one acquainted with the list of Vines named, and also of the Siracusa—but particularly the Galetta (Black and White), which I believe to be a first-rate Grape; very many I ordered from their peculiar shaped berries; some I have still, and others I sent to Luton Hoo, Beds, but whether any valuable sorts remain there I know not. *Charles T. Warde, Clopton House, Stratford-on-Avon, Jan. 9, 1854.*—P.S. - Speaking of gigantic fruit, I saw a Pine Apple (Cayennensis) at Florence, 18 French lbs. weight; is this kind grown in England? *C. T. W.* [The old French pound was an ounce and more heavier than the lb. avoirdupois. No Cayenne of anything like this weight has been fruited in England.]—In Prince's Treatise on the Vine we find the Barbarous is inserted as a synonyme to the Black Morocco. This is well known to be a large, black, oval, or somewhat obovate Grape. Amongst black oval Grapes, as classed by Audibert of Tonelle, near Tarascon, there is the name of Barbera noir, said to be cultivated near the Po; and the same author places the Barbaroux rose amongst Grapes with grizzly or rose-coloured berries, said to be grown near the mouths of the Rhone. In the Catalogue of Dauvesse, of Orleans, we find the name of Barba rosa. M. Jamin, Bourg-la-Reine, near Paris, mentions the Barbarossa as a large white Grape, requiring a warm situation. He also has the Barbera noir marked in his Catalogue as a large Black Grape. From the above it is probable that the Black Morocco, the Barbarous Grape of Prince, the Barbera noir of Audibert and of Jamin, are the same, but certainly different from the Black Barbarossa exhibited in this country. Then, according to Audibert, there is a Barbaroux rose, a rose-coloured Grape, which may be the same as the Barba rosa of Dauvesse. And, finally, according to Jamin, the Barbarossa has white fruit. Mr. Warde is of opinion that the Grape known in this country as the Black Barbarossa is one of those which he marks with an asterisk; the most probable amongst them is the Damasco nero, for the so-called Black Barbarossa appears to be allied to a group of such sorts as the true Black Damascus, Black Prince, Black St. Peters, &c. *R. T.*

Cottagers' Stoves. — I have observed with great interest the attention recently paid in your columns to the subject of cookery for the poor. In your last, you advert to the great desirability of an effective cooking stove. Such an one as you suggest is much needed. In the United States they have stoves of the very sort you describe. They are of iron, however, with suitable apertures, and well adapted for coal. I observed, while a medical student in France, a delf or porcelain stove, which I have often thought, if pierced for cooking vessels, would answer very well. It realised a very genial temperature. Wood was employed to heat it, but turf, charcoal, and cinders or coke would also suffice, if not coal. Such a cooking stove could be made for a very trifle out of common pottery clay or fire clay. A ventilating chamber, oven, and draught regulator might be easily added. Such a stove would cook, heat, and prove a great boon to the multitude. Permit me to pass a word of remark on some of the recent cooking receipts. They are calculated, unless with a proper stove, to lead to the consumption of a great deal of fuel, and to take up much time. Besides, it is quite a mistake to suppose that to boil a pound of rice in a gallon of water creates a gallon, or whatever a gallon weighs, of food. There is just a pound of nutriment and no more, though a hogshead of water were used. Such messes are highly useful to eat with bread, but almost worthless as exclusive nourishment. *Henry M'Cormac, M.D., Belfast.*—It has been observed, with regard to the cooking stoves indicated in the *Gardeners' Chronicle* of the 31st ult., that, on account of ventilation, they would not be advisable for families occupying but a single room for sleeping as well as all other purposes; but this objection was made on the notion that the stove would be built into the chimney, so as to prevent the usual current of air upwards through the shaft. On the contrary, it is essential that though the draught through the stove itself should be capable of regulation, yet the chimney itself should be left open, excepting that small part of it occupied by the pipe from the stove. Such an opening is essential for the carrying up the water evaporated in cooking, as also the various odours that arise from it. The pottery recommended as the material of such a stove would doubtless be not only the best, but also the cheapest substance of which it could be composed. Small cooking stoves of pottery are made in France, and sold for so small a sum as 12 sous, (6*d.*), including for this price an iron grating, and an iron bandage around the fireplace. The fuel for these stoves is charcoal, and they are found to be exceedingly economical. Some years ago a gentleman requested a friend in the East India Company's service to bring home one of the common stoves used by the Chinese; it was procured accordingly and proved to be, of course, China ware, and of precisely the same form as the above-mentioned French stoves. The Chinese stove was, for many years, used for experiments in a chemist's laboratory, and proved in frequent use to be far more durable than are the French ones, though these last long with moderate care. *B.*

Humus and Ammonia as Fertilisers.—The paper of Dr. Schulzenstein, on the fertilising action of the humates, quoted by "M. J. B.," at p. 3 of your current volume, is of so much apparent importance, that an abstract of it (if too long to give entire) would be very desirable. Whether he may have generalised too far, upon the many cases hardly reconcileable with the mere carbonic acid theory, without due consideration of those for which the humates will not account, we may better judge when his own arguments are before us. Of "J. H. K." "On the Action of Ammonia," p. 11, who seems to incline towards the other extreme, I would ask, whether he has borne in mind, 1st, That in starch, wood, &c., the hydrogen is still united with oxygen, in the full proportion to form water, so that they may be regarded, atomically, as compounds of water and carbon; 2d, That nitrate of soda produces the like profuse and luxuriant vegetation to ammonia? A mixture of nitrate of soda with gypsum and wood ashes threw up such a dark green dense mat of Clover, 2 to 3 feet deep, as I have rarely seen; while the other fields, on the same estate, were pale, thin, and sickly looking; probably not half the crop. And gypsum, with farm-yard dung, has been found to produce a heavy crop of Beans (Mr. Hannam, *Highland Journal*), different from "M. J. B.'s" inference. *J. Prideaux.*

Orchard Houses.—One of the chief demands upon a gardener's attention being a good supply of fruit for his employer's table, it becomes an important question with

him to decide upon the best means of securing that requisite. Foremost, in the estimation of many at the present day, stands the orchard house. "A house for the cultivation of miniature fruit trees in pots." Now, I admit, that such trees are well adapted to afford a vast amount of pleasure to the cultivator, and also some fruit; but are they adapted to supply a table with fruit regularly for the season, such as with Peaches, Nectarines, Apricots, Plums, Cherries, and even Pears? I doubt not. They were in the first place intended for small gardens, where the proprietor himself would direct and assist in the management of the trees; and if "the pleasure" arising from the cultivation of the trees is considered an equivalent for fruit, they will doubtless prove satisfactory; but where, I would ask, is the experienced cultivator who would substitute these "miniature trees in pots" for his walls, or say his walls faced with glass? Let me beg of those who advocate them so strongly as rivals to garden walls, to publish a fair statement of their success both with these houses, and with walls faced with glass; giving the average of the produce in each case, and the time devoted to their management; thus balanced, I think the superiority of walls will be apparent. If we are to have (as I anticipate and trust we shall have), glass structures or houses for the cultivation of our tender fruits, let us have them something like equal to the demand to be made on them, and instead of covering a few square feet with glass, let us adopt the ridge and furrow principle of roofing, over a much larger space than we have hitherto been in the habit of doing. We might then plant in the borders in brick compartments or divisions, training the tops to trained wires, espalier fashion, or otherwise, as might seem best, having still a quantity of portable plants in boxes and tubs: we might then safely calculate on producing a serviceable supply of fruits, besides choice winter and early spring vegetables, salads, &c. With such a structure I would still think it unwise to abandon walls for Pears, Plums, and Cherries; and a good south wall in favourable localities for Peaches and Nectarines, even without glass, will generally supply a very useful amount of fruit. Until we get something near what I have just been attempting to describe, my experience is in favour of walls faced with glass, as compared with small orchard houses for the purposes mentioned. *W. C. E., Gloucester.*

Advantages of Draining Woodlands before Planting.—Arboricultural operations are now being more looked into, and the future benefits of such are better understood than they were 30 years ago. At that time it was thought sufficient to drain only decidedly wet portions of land and at about 50 feet apart, and even the practice then was to plant with Oaks, averaging 5 feet in height—adoptions known by the scientific arboriculturists of the present day to be highly disadvantageous where rearing a healthy crop of trees is kept in view; for it is now ascertained that thoroughly draining land before planting, constitutes the very key-stone of future success; and the neglect of this in former days accounts for the general inferiority of plantations which at present exist. Drainage does not merely remove stagnant water, which is all it is supposed to do by many, it has also a tendency to open up the soil, thereby admitting heat and furnishing food congenial to the growth of vegetation; nor are these all the advantages to be derived from drainage—it also ameliorates the climate, for in undrained plantations there always exists a humid atmosphere, which favours the growth of Lichens and other plants that like moist air; while, on the other hand, in thoroughly drained plantations the atmosphere is kept free of all such noxious vapours. Seeing, therefore, that such circumstances as those described above are favourable to the healthy growth of trees, I would at this time urge on all foresters the great necessity there exists for thorough drainage; such as putting the drains in at about 35 feet apart, 30 inches in depth, and, of course, with a proper outlet. Although at the time this kind of draining may be thought an "unnecessary waste of money," the future results will show the contrary to be the fact. Planting with Oaks averaging 5 feet in height is still partially adopted; such never succeed so well as plants from 2½ to 3 feet high, even although the ground be covered with rough Grasses, for they are affected so much by wind as to loosen the earth round the stems, permitting frost to enter, thereby causing damage to the roots; and in addition to trees of such a size never succeeding so satisfactorily as those of a smaller description, the former before being removed have become habituated to their situations, they have taken permanent hold of the soil, making large growths; and, in short, they appear as if they had set themselves down with the intention of never being removed; consequently, when taken out for planting, it is a long time before they begin to grow, and they never afterwards make such vigorous growths as they formerly did; while, on the other hand, Oak trees from 2½ to 3 feet in height are not subject to such inconveniences. Although they may at first be overtopped by rough Grasses, yet a few shillings extra expense will obviate this difficulty; better have a future healthy crop than a sickly and unpromising one. I would also in most cases strongly recommend the use of Larch as nurses, more especially in sheltered and low-lying situations; they have been found by experience to be best adapted to the rearing of Oak, and to soonest repay the planter. Larch has now nearly beat its rival (the Scotch Pine), although the latter is preferable in high lying districts, where a much greater degree of shelter is required, and where by its thick foliage it may nurse the Larch, although not in perfection. *W. R. A.*

Gardeners' Royal Benevolent Institution.—I perceive by my polling paper that an election of two Pensioners on the funds is to take place on the 18th inst. Being a subscriber I think it no more than prudent to raise my voice against the present system of electing pensioners on the funds of this charity. There are 17 candidates, and out of that number there are the names of seven who have not been subscribers at all. From the last report, it appears that the funded stock of the Institution is 3000*l.*, and the present 19th Rule shows how that money is disposed of. It looks as if annual subscribers would never be much benefited by the liberal donations which some are so kind to give to the Institution. If, therefore, the committee shall continue to allow non-subscribers to be placed on the same footing with subscribers, and do not think proper to confine the pension to subscribers only, giving the preference to such as have contributed longest, I, as well as I believe many others, shall feel disposed not to subscribe any more to the funds; for any reasonable man cannot, I think, but admit that the present system of election is very unjust. *A Subscriber.*

Societies.

Entomological, *Jan* 2.—The President in the chair. Amongst the donations to the library and museum were the recent publications of the Natural History Society of Vienna, the Entomological Society of Stettin, an elaborate memoir on Blatta orientalis by Dr. Cornelius, a number of beautiful lepidoptera (from Bogota) by Mr. Jones Stevens, and also a variety of rare British micro-lepidoptera by Mr. Vaughan, of Bristol. The Secretary gave notice that, at the anniversary meeting, it was intended to propose the removal from the council of Messrs. Spence, Curtis, Westwood, and Janson, and the introduction of Messrs. Dallas, Stainton, F. Smith, and Edward Shepherd in their place; and that no alteration was intended to be proposed in the officers. Mr. Samuel Stevens exhibited some specimens of the splendid Morpho Ganymede (M. Sulkowskyi, of Kollar), received by him from Mr. Jones Stevens, of Bogota; one of the specimens had arrived saturated with an exudation of grease, which he had entirely removed by dipping the insect in camphine, and then covering it with magnesia, by which its beauty was quite restored. Mr. Stevens also exhibited some rare lepidoptera from Manilla. The Secretary read an extract of a letter from Mr. Jones Stevens, on the occurrence of numbers of species of micro-lepidoptera in Bogota, many of which come to the lamps at night, but are difficult to be captured and preserved in good condition. He also read the account of the mode of taking honey from bee-hives in China, given by Mr. R. Fortune in a previous number of the *Gardeners' Chronicle* (1853, p. 822), upon which Mr. Westwood stated that a similar plan of taking honey by turning up the hives and raising a cloud of tobacco-smoke had been adopted by an apiarian neighbour of his at Chiswick, and that he had himself succeeded in driving the bees into an empty hive and cutting out as much comb as was considered advisable, even without any smoke, simply by working slowly and quietly, brushing off the few bees that remained on the comb with a feather. Mr. Curtis read a note on the habits of Panurgus ursinus, a curious wild bee which he had observed forming its burrows in hard earth at Tunbridge Wells. He had noticed the females occasionally curled up as if asleep in the flowers of Hieracium, and at other times with their hind legs laden with pollen. The first portion of a memoir by Mr. Baly on the Chrysomelidæ of Australia, containing monographs of the genera Phyllocharis and Lamprolina (new gen.) was read; also the description by Mr. Hewitson of some new species of butterflies from Bogota, presented to the Society by Mr. Jones Stevens, with two plates, and an elaborate memoir by Dr. Davy, F.R.S., on the chemical composition of the excrement of insects, from which some remarkable results were derived, by way of analogy with the nature of the urinary and excrementitious secretions of birds, serpents, &c.

Notices of Books.

In *Rendle's Price Current and Garden Directory for 1854*, the descriptive notes and practical observations will, on the whole, prove useful. We must, however, observe that what is called a "complete" collection of seeds, "sufficient for a large garden" for one year's supply, is by no means what it professes to be. In the first place, 1 quart of Knight's Tall Marrow Pea is not enough; nor is 1 pint of French Beans. Half an ounce of Cauliflower seed is a very small quantity to withstand all risks, and afford a large supply. No Cardoons are furnished. The quantities of Mustard and Cress are insufficient, and many things deservedly recommended in the Descriptive Catalogue are not included. Mazagan Beans "esteemed the best for early crops;" Hammersmith Hardy Green Cabbage Lettuce, "the best for autumn sowing to stand the winter;" Lettuce-leaved and Flanders Spinach; all recommended in the Price Current, are omitted, to say nothing of Corn Salad, and various other things requisite in a large garden. The "collection" in question is, on the whole, a good one; but most certainly neither complete nor sufficient for a large garden.

Beauties of Byron. (Murray's Railway Reading.)—A careful selection, "by a Clergyman," from the prose and verse of the greatest of our modern poets. The name of the publisher, and the profession of his editor, offer a satisfactory guarantee that the volume contains nothing which is unfit to be placed before the most fastidious reader. To us the poetical selections appear to have been made with taste as well as care, and to present a really good example of the various styles of a most versatile and brilliant writer.

The first volumes of the Geographical and Natural History divisions of the *English Cyclopædia* (Bradbury and Evans) are now completed, and dedicated to Her Majesty. It is difficult to conceive that the capital woodcuts in the Natural History department can be the same as those in the "Penny Cyclopædia," so great is the difference between beautiful and bad typography.

Once Upon a Time (2 vols., 12mo, Murray), is the quaint title of a collection of literary pieces from the agreeable pen of Mr. Charles Knight. As may be inferred from the title, they refer to things and times now for ever passed away, and we know no one in whose hands such subjects would be more successfully treated. The Farmer's Kitchen will be recognised by everyone who can reckon half a century in his life, as a truthful and clever sketch of agricultural manners, that we suspect have now wholly died out even in Ireland, although we saw some remains of them a few years ago in that country.

A very useful supplement to *Willich's Popular Tables* (Longmans) has just appeared, explaining the duties upon successions and legacies chargeable under the act passed last session of Parliament.

New Plants.

37. Dendrobium cymbidioides, *Lindl.*

The "Botanical Magazine" for December contains (fig. 4755) a good figure of this rare plant, which has been obtained from Java, by Messrs. Rollisson. It is a psuedo-bulbous species, with a pair of short leathery oblong leaves, and an erect raceme of five or six rather distant yellow flowers, with a white crimson and yellow lip. If it should prove easily cultivable, as is probable, it will form a gay ornament to hothouses.

38. Mathieua galanthoides, *Klotzsch.*

This is a diminutive bulb brought from Payta, in Peru, by M. Warczewitz, which has flowered with Mr. Mathieu, of Berlin. It appears to have the habit of a Snowdrop, with from 2 to 4 sessile, erect, white flowers, tipped with green upon a solid compressed scape, about 3 inches high. The leaves are oval, narrowed into a long petiole. According to Dr. Klotzsch, who has published an account of it in the *Allgem. Gartenzeitung*, 1853, p. 327, the genus is near Calostemma, from which it differs in having a straight three-cornered tube and inflated limb, a toothless coronet, sessile flowers, &c. It seems to be a mere botanical curiosity.

FLORICULTURE.

The Calceolaria.—Within the last few years, this flower has improved much, both in form, size, and colour of marking, and we now possess an almost endless variety; yet—it is the case as with other flowers—all are not perfection that are offered for sale; in fact, many of them are scarcely worth cultivating. It therefore behoves the amateur to use some caution, if he intends to make a judicious selection. The properties of the Calceolaria, I believe, are very generally admitted to be the following: a plant of a shrubby or half-shrubby habit, the flower-stems strong and erect, the flower large and globular, good outline and clear of indentation, and the marking decided and striking in colour. I believe the Calceolaria is generally considered difficult of culture; but this is a fallacy easily refuted, for, with care and attention there is scarcely any florists' flowers better to manage; and often do we see this plant in cottage-windows glossy, luxuriant, and full of bloom. The grand secret in growing the Calceolaria is to keep the plants tolerably dry in winter, and well protected from frost, with as little fire-heat as possible; and during the summer months to supply them liberally with water, and keep them well shaded from the scorching rays of the sun. I grow the plants in frames placed against a wall with a south-east aspect, the front and ends being glass as well as the top. The top lights lift up, instead of sliding, so that I can admit air (most essential to the successful culture of this plant) in wet foggy weather, and at the same time exclude the rain. The frames are elevated by brick-work, about 2½ feet, in order to show the plants when in bloom to greater advantage, as well as being a more convenient height for watering and general management. In autumn I like my plants rather small than otherwise, if healthy and well-rooted; then I place in 4-inch pots, in compost consisting of one-third good friable loam, well rotted from an old pasture, one-third peat or heath soil, and one-third leaf or vegetable mould, well mixed together, with a quantity of silver sand: good drainage is indispensable. Such new varieties as I require I get from the nurserymen as soon as I can in autumn. During the winter months the plants require but little water, but they must be kept from flagging; all decayed leaves should be picked off; and they should be well protected from frost by covering at night with mats, &c. If the plants should by any means get frosted, keep them covered up for a few days from the light and sun (which would now prove fatal); and if not too far gone they will recover. About the last week in February, the plants begin to exhibit signs of growth, and then I re-pot them into a fourth vegetable-mould, and one-fourth good rotten cow or horse dung, with silver sand as before; and during

the two succeeding months of March and April I continue to re-pot them according to their growth, until I get them into the pot I intend them to bloom in. The "one-shift system" does not at all answer with the Calceolaria. About a month previous to their coming into bloom, I use a little weak guano-water, about twice a week, which I find excites their growth considerably, and improves the bloom. Watering the plants over the top with a fine rose and tepid water, occasionally, in the mornings, during their growth, will be found very beneficial. In May and June they will be in full bloom, and then the cultivator receives his reward for the "care and attention" bestowed on them during the inclemency of winter, by the grand display of flowers which they furnish. After the plants have done blooming, cut them down, top-dress, and remove them to a shady situation, supplying them liberally with water, when they will soon throw out side-shoots, which must be taken off when 2 or 3 inches long, for increase. After blooming is a trying season for the Calceolaria; for the plant is greatly exhausted, and if exposed too much to the sun, it causes the thrips (the greatest enemy to this plant); and the loss of the old plants is then the almost inevitable consequence. Green fly is also a great pest, and must be kept down at all seasons of the year. This may be done effectually by fumigating with tobacco. In September, offsets and cuttings may be taken, and struck in the usual compost, adding more silver sand, by inserting them about 2 inches apart, in wide-mouthed pots; if a bell-glass is placed over them, they will strike all the sooner. After the cuttings are well rooted, plant them in 4-inch pots, as before recommended; and, by proper treatment, they will make fine blooming plants in the ensuing spring. *B.*

HYDRANGEAS.—In his article on the Hydrangea (see p. 839, 1853), your correspondent has inadvertently fallen into error in the following passage, viz.:—"Few I imagine will have forgotten the fine specimens of this plant that were exhibited in the Horticultural Society's Gardens by Mr. Hill, in 1852; these were in small pots, and were certainly excellent examples of skilful cultivation;" I therefore take the liberty of correcting him. The plants referred to were exhibited by me and in my name, Mr. Hill being at that time my foreman. I have every reason to believe that I shall produce, in the coming season, plants in every respect as fine as those so deservedly praised by "E. B." *John Westwood, Floral Nursery, Acton Road, Turnham Green.*

PICOTEES: *H F.* Mrs. Barnard (Barnard), light-edged rose; Alfred (Dodwell), heavy-edged purple; Princess Royal (Wilmer), heavy-edged red. Yellows: Euphemia, Princess Alice, and Conrad. We never recommend dealers.

Miscellaneous.

Improvements in the Manufacture of Paper. By R. A. Brooman, 166, Fleet Street. (A communication.) Patent granted June 10, 1853. (No. 1422).—*Claim.* The manufacture of paper from wood and woody fibres, reduced to fibrous pulp by means of mechanical agents, acting in the direction of the length or grain of the said fibres, and parallel thereto, together with water or other suitable liquid, applied as described. — *Mechanics' Magazine.*

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

CONSERVATORY AND STOVE. — If not already done this season, take advantage of the present unfavourable state of the ground for out-door operations to thoroughly wash the paint and glass of all plant houses, especially the show-house, in order to give all a clean and neat appearance, as well as to facilitate the admission of the greatest possible amount of light to the plants. Nothing adds so much to the enjoyment of a collection of plants as seeing not only them, but everything connected with the houses, scrupulously clean and orderly, and the gardener who studies his own interest as well as the gratification of his employers, will make order and cleanliness his first consideration. See that the foliage of Camellias and other broad-leaved plants is perfectly clean before the blossoms begin to expand, for nothing detracts so much from the beauty of such plants as seeing their leaves covered with dust, or otherwise exhibiting signs of neglect; and this should be effected before the blossoms open, as it cannot afterwards be done without injuring them. Salvia splendens, and Euphorbia jacquiniflora, although requiring very different treatment during the growing season, are exceedingly useful for the decoration of the conservatory in winter, both being brilliant in colour and remaining long in beauty; they do very well in a temperature of about 50°, and they will sustain no injury if, on severe nights, the house is allowed to sink to 40°. Except for its bad habit, Poinsettia pulcherrima is one of the most effective winter blooming plants in cultivation; Luculia gratissima is also a splendid plant for winter decoration, loading the atmosphere of the house with the pleasing fragrance of its large heads of blossom. When plants have done flowering remove them from the show-house, throwing away at once such as can be spared, reserving in the case of Salvia splendens, and such things as are annually propagated from cuttings, only one or two plants, and others as circumstances may dictate; this will avoid over-crowding the houses with useless stock, and allow of giving proper attention and sufficient space to that kept. Take every opportunity of admitting air to greenhouse plants, and when necessary use a little fire-heat by day to dispel damp. On frosty nights be satisfied with a temperature a few degrees below the mean, and avoid the drying effects of fire-heat as much as can safely be done. For the present the mean night temperature of the stove may be about 55°, raising it to 65° by day, and with sunshine and air 75° may be allowed. Such plants as Allamandas, Clerodendrons, Ixoras, Dipladenias, &c., may now be started into growth when wanted to be in blosson early. Old specimens of the two former should be pruned back rather closely, and disrooted, repotting them in such sized pots as will allow of giving them a liberal shift by-and-by. Such plants will be greatly benefited by a gentle bottom heat, particularly those that may have had their roots disturbed. Crowea saligna and others of this genus, if placed in a light part of the stove, will make vigorous growth during the spring, and bloom finely in the conservatory for months in summer. These are amongst the most useful plants we possess and well deserve the attention of those who have a show-house to keep gay. By making two divisions of the stock of plants, and placing one portion of them in heat at once and the other about the latter end of March, they will be in bloom from May till November. COLD PITS.—The past fortnight has been a trying time for bedding stock wintered in cold frames, showing the absolute necessity, in garden affairs, of exercising forethought and precautionary measures betimes. Where the previous directions of the Calendar have been properly attended to, the plants having been rooted early, well established, and hardened by exposure to air, will have ceased growth some time ago; and the wood being now in a firm state will not be injured by exposure to a few degrees of frost, and will not be so liable to suffer from damp if excluded from light and air for a few days as if the tissue had been full of sap, and the plants in a soft growing state. Keep the atmosphere of the pits as dry as possible by giving air on every favourable occasion, removing at once any leaves, &c., affected by mould or frost, and covering up early in the afternoon to avoid condensation and damp. Look over your plants at the earliest opportunity, comparing them with your wants, and remove to a growing atmosphere at once such as it may be necessary to propagate extensively. Healthy young wood of Verbenas, Anagallises, and most "bedding out plants" roots very freely when placed in a temperature of about 70°, and with proper care soon forms nice stock. It is, however, of importance to provide a sufficient stock of cuttings at once, so as to allow of getting them rooted, and the plants removed to cold frames, thus making room for other things in the propagating house, and securing strong plants, properly inured to the weather, by turning out time.

FORCING DEPARTMENT.

PINERY.—Where leaves and tan are used for affording bottom-heat, take advantage of the earliest possible opportunity to provide a stock proportionate to the demand, storing them in a dry place till wanted for use. Tan should always be procured some time previous to its being wanted for use, and placed under cover, allowing it to heat sufficiently to drive off the superfluous moisture it may contain, which will tend to prevent its heating excessively when placed about the roots of the plants. Having a stock of necessaries in good order and readiness, greatly facilitates the operation of shifting and rearranging the plants, and allows of this work being done at the proper time. Attend to the directions in last Calendar as to temperature, &c. VINERY.—Maintain a moist atmosphere, syringing the Vines morning and evening on bright days. Proceed slowly during the present unpropitious season, remembering that a few degrees maintained against cloudy dull weather are barely repaid by the result; and that a little hindrance now is easily made up under the favouring assistance of sunshine, which may be expected soon. Do not exceed 55° by night, until all the buds are plump and ready to start into growth; but by day, with sunshine, 65° or even 70° may be allowed. See that the roots are at least properly protected from the vicissitudes of the weather, for without a healthy root-action it is vain to hope for success. PEACHES.—Except that the temperature should be slightly lower, and a freer circulation of air afforded, the above remarks are applicable here. Trees in blossom should not be syringed, and air should be admitted on every favourable opportunity. Look over the stock of Strawberry plants in pots, and remove to the protection of a cool house or pit, a portion to succeed those first placed in heat.

FLOWER GARDEN AND SHRUBBERIES.

Proceed vigorously with any alterations which may be in hand whenever the state of the ground and weather will admit. Where it can be done, alterations, particularly those involving the transplanting of large shrubs, should be done in autumn, for there is much less chance of failure in removing evergreens, &c., at that season than at the present; and, in most cases, the longer such work is delayed after this time the more care and expense will be required to ensure success. Sweep and roll lawns and walks after the late frosts, which will be of great service in improving the surface and giving it a neat appearance. If not already done, get plants on walls pruned, and nailed or tied as soon as possible, leaving Tea Roses, or any plants liable to be injured by frost, to be done in March.

FLORISTS' FLOWERS.

As much cannot be done out of doors whilst the weather continues so unfavourable, everything which will be required for summer's use should undergo a thorough repair; possibly there may be some small hand-glasses broken—these should be mended. Carnation sticks may be repainted; the larger ones, used for supporting Dahlias, will also require seeing to, and those which are decaying at the bottom will want repointing. It is well to char the ends of new ones, or give them a coat of gas tar as far as they are inserted in the ground. The lights of the Auricula frame may possibly be defective, and it will be highly necessary to see to them. Make also a quantity of small deal pegs, smoothing them on one side so that they may be written on; these should be rubbed with white paint, so that when wanted at a moment's notice, in the summer, to mark seedling Pansies, or any other florists' flowers, they will be ready, and form a cheap substitute for "Mapplebeck's Menogram." As for what is to be done with the general stock we must talk about that when the weather allows such operations. The hint we have now thrown out, if acted on, will, we are sure, prove beneficial.

HARDY FRUIT DEPARTMENT & KITCHEN GARDEN.

Proceed with the pruning and nailing of wall trees whenever the weather will allow of doing so, but, depend upon it, there is nothing gained by keeping the hands at this sort of work in all weathers, as some gardeners do. Push forward the pruning of small fruit bushes; and take advantage of frosty mornings to get manure or compost wheeled upon the ground where it may be wanted; and get all vacant ground dug or trenched, throwing it up rough so as to expose the greatest possible surface to the action of the weather. See that Peas above ground are not injured by birds or slugs, and as soon as the state of the ground permits get in a second crop, and also of Beans. Look carefully after Lettuce, Endive, and Cauliflower plants, &c., under glass, admitting air on every possible opportunity, and protect them from slugs. Preparations should be made for planting Potatoes in frames by getting leaves and manure sweetened by fermentation previous to forming the bed.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Jan. 12, 1854, as observed at the Horticultural Gardens.

*The highest temperature during the above period occurred on the 19th, 1823—therm. 60 deg.; and the lowest on the 19th, 1838—therm. 4½ deg. below zero.

Notices to Correspondents.

BOOKS: *A C.* The best treatise in English on Peach management is in the last volume of the Journal of the Horticultural Society. Lindley's "Theory" is out of print; but a new and much enlarged edition is in preparation. The "Guide to the Orchard" can be had of all booksellers. There is no likelihood of a new edition of the last.

DISEASE: *R C A.* Your inquiry is not intelligible. What is meant by "the" disease of Larch? That tree, like others, is subject to many wholly different kinds of disease.

FEIGI DOMO: *A M.* If you will refer to the advertising columns of our last week's Paper, p. 9, you will find the information you seek respecting this material. ‡

GOOSEBERRIES AND CURRANTS: *Alpha.* For training against a wall, the most deserving, on account of flavour, is the Red Champagne; and its shoots naturally grow upright. If you wish a larger sort, and to be trained horizontally, the Red Warrington is recommended. Currants for a wall, Knight's Large Red and the White Dutch. ‖

MUSHROOMS: *Reader.* The most certain plan would be to make a new bed. If, however, you have any means of applying heat, either in the shape of dung linings or otherwise, to the one you have, you may still perhaps be able to infuse sufficient warmth into it to induce the spawn to run. ‡

NAMES OF PLANTS. We have been so often obliged reluctantly to decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*A D.* Pray make no apology; we are always happy to attend to inquiries from correspondents like you. The plant is Pholidota undulata.—*F H S.* A very bad variety of Oncidium Cavendishi.—*H R S.* A Gesnerad, called Nematanthus chloronema.

ORCHIDS FROM INDIA: *T P.* You will find full particulars in the first number of our volume for last year. The agents in Calcutta to whom you must apply are Messrs. Charles Cantor and Co.

PEACH-HOUSE: *S B.* A foot from the glass is considered a proper distance to train the trees. ‖

MISC: *Gaidheal.* We do not know, and cannot satisfy your curiosity; certainly not Scotland, we rather think Bedfordshire.

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

MANURES.—The following Manures are manufactured at Mr. LAWES' Factory, Deptford Creek:—

Turnip Manure	... per ton	£7	0 0
Superphosphate of Lime	,,	7	0 0
Sulphuric Acid and Coprolites... ...	,,	5	0 0

Office, 69, King William Street, City, London.

N.B.—Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia.—Sulphate of Ammonia, &c.

PERUVIAN GUANO, the guaranteed import of Messrs. ANTONY GIBBS AND SONS, Lobos Island Guano, Superphosphate of Lime, and all Artificial Manures, Linseed and Rape Cakes, &c.—WM. INGLIS CABNE, 10, Mark Lane, London.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desirous of receiving instructions in Chemical Analysis and Assaying, will find ample facility and accommodation at the College.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained from the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 60*s.* per ton, and in quantities less than half a ton, at 4*s.* per cwt., for ready money only, and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage.

It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, and from all the other Agents of the Company. Recommendations and Testimonials may be seen at the Works.

REDUCTION IN PRICE.

WEIR'S IMPROVED GALVANISED WROUGHT IRON LIQUID MANURE PUMP.

The Fittings of these Pumps are wholly of Brass, and there is no leather or other matter which can be affected by the manure.

Price, complete, with 10 feet of Flexible Suction Pipe, 4*l.* 15*s.* Terms, cash on delivery.

EDWARD WEIR, Agricultural Engineer, 16, Bath Place, New Road, London. Removed from Oxford Street.

Catalogues, with Illustrations, sent free by post.

WARNER'S PATENT FARM AND COTTAGE PUMPS.

Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

	£	*s.*	*d*
Patent Pump	1	15	0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3	0	0

Larger sizes if required.

The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

JOHN WARNER & SONS,

8, CRESCENT, JEWIN STREET, LONDON.

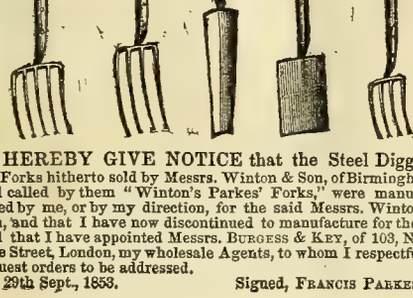
Every description of Machinery for Raising Water; Fire Engines, &c.

An Illustrated Book sent on application post free.

PRIZE CHURN.

ANTHONY'S PATENT AMERICAN.—The Royal Agricultural Society again awarded the prize to this Churn, at their last meeting at Gloucester; at the trial this Churn made 4 lbs. 6 oz. of butter from 4 quarts of cream, the best of the other Churns tried made only 3¾ lbs. from the same quantity and quality of cream; 2000 of these Churns are sold yearly. Copies of testimonials, and list of prices sent on application.—BURGESS & KEY, Agricultural Implement Warehouses, 103, Newgate Street, and 52, Little Britain, London.

WINTON'S PARKES' STEEL DIGGING FORKS.



I HEREBY GIVE NOTICE that the Steel Digging Forks hitherto sold by Messrs. Winton & Son, of Birmingham, and called by them "Winton's Parkes' Forks," were manufactured by me, or by my direction, for the said Messrs. Winton & Son, and that I have now discontinued to manufacture for them; and that I have appointed Messrs. BURGESS & KEY, of 103, Newgate Street, London, my wholesale Agents, to whom I respectfully request orders to be addressed.

29th Sept., 1853. Signed, FRANCIS PARKES.

THE LANDOWNERS' DRAINAGE AND INCLOSURE COMPANY.
INCORPORATED BY SPECIAL ACT OF PARLIAMENT.

Tenants for Life, Trustees, Mortgagees, Incumbents of Livings, &c., can have all works of Draining, Warping, Irrigating, Inclosing, and every other improvement to land, executed by the LANDOWNERS' DRAINAGE COMPANY, either by Contract or on Commission. They will provide the money by a permanent charge on the inheritance, or repayable by instalments. They are also ready to undertake the Drainage of Towns, and all works incident to such improvements. This Company having been engaged in extensive works for many years in most of the Counties in England, and having in their employ the largest Practical Staff in the United Kingdom, whose sole attention is devoted to such improvements, is the best guarantee for the success of their works.

Every information will be given at the Offices of the Company, 30, Parliament Street, London, or 9, Bedford Circus, Exeter.

THOMAS MAY, Secretary.

TO LANDOWNERS, SOLICITORS, ESTATE AGENTS, ETC.

THE LANDS IMPROVEMENT COMPANY, incorporated by special Act of Parliament, 1853, having perfected their organisation, are prepared to receive applications for the execution of improvements, under the provisions of their Act.

The Act extends to England, Wales, and Scotland; and empowers persons in the actual possession of lands, or in receipt of the rents, such as tenants for life, trustees, bodies corporate, incumbents of benefices, mortgagees in possession, guardians of infants, &c., to effect substantial improvements on their estates, and to convert the outlay on such improvements into a terminable annuity or rent-charge of from 14 to 25 years, at will.

The Company, acting under the supervision of the Inclosure Commissioners, will undertake and execute improvements, or will supply the capital to landowners preferring to execute improvements themselves, or will grant the powers of their Act to landowners seeking merely to charge the inheritance with the outlay on improvements from their own funds.

The Agricultural Works of Improvement particularly specified in the Company's Act, are:—

1. The Drainage of any Lands by any such means as the Inclosure Commissioners shall approve.
2. Irrigation, and Warping of Lands.
3. Embanking of Land from the Sea, or Tidal Waters, or Rivers, in a permanent manner.
4. Enclosing or Improving the Drains, Streams, or Watercourses of the Land, under the Inclosure Commissioners.
5. Reclamation of Land lying waste.
6. Making Farm-roads to the extent of one-half of the outlay for such roads.
7. Clearing Lands.
8. Erection of Farm-houses, and other Buildings required for farm purposes to the extent of three-fourths of the outlay for such Farm-houses and other Buildings.

In effecting the above Improvements there may be erected any Engines, Machinery, Engine-houses, Mills, Kilns, Sheds, Yards, Shafts, Tanks, and Reservoirs, Pipes, Conduits, and Watercourses for Irrigation, Tram-roads and other ways, Bridges, Weirs, Sluices, Flood-gates, and Hatches.

For Forms of Application and further Information apply to the Hon. W. NAPIER, Managing Director, 2, Old Palace Yard, Westminster, London.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

PATRON—His Royal Highness PRINCE ALBERT.
PRESIDENT OF COUNCIL—Earl BATHURST.
PRINCIPAL—Rev. J. S. HAYGARTH, M.A.
PROFESSORS, &c.

Chemistry—J. A. C. Voelcker, Ph.D., F.C.S.
Geology, Zoology, and Botany—James Buckman, F.G.S., F.L.S.
Veterinary Medicine and Surgery—G. T. Brown, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. Armstrong, C.E.
Manager of Farm—G. Austin.
Assistant to Chemical Professor—A. Williams, M.R.C.S.

The first Session of 1854 will commence early in February. The annual fees for Boarders vary from 45 to 80 guineas, according to age and other circumstances. The Fee for Out-Students is 40*l.* per annum. The College Course of Lectures and Practical Instruction is complete in one twelvemonth—though a longer time is recommended. There is a department for general as well as for agricultural purposes. Prospectuses and information can be had on application to the Principal.

The GUIDE TO THE ROYAL AGRICULTURAL COLLEGE FARM may be obtained of HAMILTON, ADAMS, & Co., Paternoster Row, London; and EDWIN BAILY, Cirencester. Price 1*s.*

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL AND GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.
Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

The Agricultural Gazette.

SATURDAY, JANUARY 14, 1854.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

THURSDAY, Jan. 19—Agricultural Imp. Society of Ireland.
THURSDAY, — 26—Agricultural Imp. Society of Ireland.

A FEW remarks will be necessary to explain the reports of last harvest, given by our correspondents in another page. We may mention, in the first place, that exception has been taken by some to the method of inquiry adopted. One of those on whose judgment we should be most inclined to rely, writes as follows in answer to our circular:—

"I must really beg to be excused making such a report as is here asked for, on the simple ground that I have no data worth the name on which to found such estimations. I can as yet only guess at the probable yield from my own farm; how much less can I know with any measure even of probability what it is for a neighbourhood, especially one where soil, &c., varies as it does in this county? This return now asked for is something very different from those general reports on the character of the growing crops which I have repeatedly furnished to you. I appreciate your endeavour to supply your readers with such information, drawn from all parts of the kingdom; but believing as I do that such estimations as are specified in the schedule must inevitably be delusive, I must decline having anything to do with it."

In reply to this we would only remark that the answers desired to our questions were simply the expression of such a judgment on the subject as could not but be formed after conversation at the market table or elsewhere amongst those whom the writer admits may each of them, by this time, be able to "guess" at the produce of his own farm. If *one* can state pretty safely, after what threshing has been done, the probable produce of his share of any given district, then surely the average verdict of all, thus arrived at, may be trusted with equal confidence for the whole of that district. This, conducted in of course a much more careful and systematic manner, was, we believe, the plan on which the estimates of the crops in Haddington, Roxburgh, and Sutherlandshire were formed for the Highland Society; and that it is not necessarily and altogether "delusive," that it is not likely rather to mislead than to instruct, may be judged of from the fact that such men as Mr. HOPE of Fenton Barns, Mr. GREY of Dilston, Mr. WOODWARD of Worcestershire, Mr. BAKER of Writtle, and others of similar standing in other counties of England and Scotland, have not hesitated to furnish the opinions asked for. We have omitted the names of our correspondents simply for want of room—as, if we are to publish any considerable portion of the correspondence which reaches us, we must condense and epitomise in every possible way. It will be remembered, however, that the several returns are for distinct localities and not for whole counties. The differences of judgment in any one county will be of course found considerable, in proportion to the variety of climate and soil it presents. In some this variety is very great, in others, as Worcestershire for instance, where geology and agriculture are both pretty uniform, no such great differences are observable.

We shall not now attempt to classify these reports or draw any detailed inference from them; but it must be remembered that the figures given represent produce per acre, and that the relation in which the crops are reported to stand to average produce is again significant merely of produce *per acre*. The produce of a district, a county, or a country, depends of course not merely on produce per acre, but upon the number of acres sown; and this in its influence on the past Wheat crop would very materially increase the deficiency of yield indicated in the reports from our correspondents. It was impossible to combine the two with any chance of telling a true tale; and we have, therefore, preferred stating the judgment pronounced only on the crop *per acre*, along with this reminder of the great influence, on the whole produce of the crop, exerted by the diminished breadth of the Wheat grown. As instances, we quote from the north and south of England three separate notices.

"YORKSHIRE.—Estimated crop of Wheat per acre, 18 bushels; *acreage* of Wheat [nearly] 20 per cent. below average—yield per acre, 20 below average; making the gross deficiency of yield below average 36 per cent."

This is translated in the adjoining page into—

YORKSHIRE: Bushels per acre, 18; one-fifth under average crop.

Again:—

"WESTMORELAND.—Estimated crop of Wheat per acre, 22 bushels; two below average—the great deficiency is in the short number of acres sown."

Lastly:—

"KENT.—I shall endeavour to comply with your wish respecting the growth of corn in 1853, not that I think my account will be of much value, as I do not get about now much amongst the farmers, and my system, as you are aware, being Wheat and green crop. I have threshed several small pieces of Wheat, the growth of which I now enclose; and to enable you to judge of the deficiency, I have added my average growth of the farm for the time I have occupied it. I think the little I have threshed will be a fair average of my year's growth; some I expect will be better, and some worse. I have since been through the whole of my growth, which I find for 24 years to be 4 qrs. 1 bush. 5 gals. What is your opinion of this quantity on light land worth about 20*s.* per acre? I have a letter this morning from a friend near Canterbury, who writes as follows:—I have threshed the whole of my Wheat,—total 91 qrs 1¼ bush., from 28 acres, something over 3 qrs. per acre; the Rivet, 3 qrs. only; White Peas, 21½ bush. per acre. The farm usually grows, I should think, from 32 to 36 bush. per acre of Wheat.

Average Growth of Wheat, Martin Farm, Langdon, near Dover.

THE guano market is closed! There is not a ton in the possession of the great importers, and the agents of the Peruvian Government are compelled to decline all orders till further supplies shall arrive from the Pacific. People naturally inquire how this has come to pass. Are the Chincha Islands, and the

Lobos, and all the other deposits, exhausted? Or are the Americans running off with this valuable substance? Nothing of the kind. The explanation we understand to be that notwithstanding a most unusual provision made by the importers to satisfy the demand here, that demand has increased so enormously as to baffle all calculation. Nearly three times the quantity consumed in 1852 has been bought in 1853.

We believe we are not far wrong when we set the sales of guano, during the last eight years, at something very near the following quantities :—

1846,	from June to	December,	24,600 tons.
1847,	,,	,,	15,200 ,,
1848,	,,	,,	22,600 ,,
1849,	,,	,,	23,800 ,,
1850,	,,	,,	28,000 ,,
1851,	,,	,,	24,000 ,,
1852,	,,	,,	23,400 ,,
1853,	,,	,,	64,000 ! !

Upon this we have no comment to make; no one could have anticipated a deficiency of supply when considerably above 60,000 tons were provided to meet a demand which had never exceeded 28,000 tons. Whether it is that the dread of a rise in price has caused consumers and dealers to lay in twice their usual stock, or whether Admiral MORESBY's report has led to the belief in an approaching scarcity, which we believe to be a groundless apprehension, we do not know; but the following passage in a circular now before us, issued by the Peruvian agents, seems to indicate that the former is believed by them to be the true cause of the unexpected demand which has arisen.

"We are inclined," say Messrs. A. GIBBS and Co., "to think that most of our friends have forestalled their demands, and thus thrown a large portion of our orders in the earlier arrivals, instead of spreading them over the whole season; but as we cannot execute them, *we must decline any new orders*, at all events, *till we see more clearly what the course of the business may be during the spring*, and in how far the large orders we have already executed have forestalled the demand which usually occurs later in the season."

For ourselves, we lean to the opinion that there are no great holders of guano, and that the demand has arisen from nothing more than the improved condition of the agricultural interest, and from an increased conviction of the sterling value of a manure formed of fish that have been digested by sea-birds.

In order to an inference of the weight of cattle from their measurement, there needs—1st, that such measurements be taken as shall furnish data for calculating correctly the solid contents of the cylindrical carcase; and 2d, that the weight of meat be known which that carcase furnishes on the average to every cubic foot of these solid contents. This weight must obviously vary considerably with the character of the breed, the age, sex, and fatness of the animal; and all such gauges as furnish only one indication to given measurements necessarily fail in every case, except the average one for which they are calculated and constructed. In Mr. EWART's cattle gauge, referred to last week, the same measurements are made to furnish a number of readings, any one of which may be selected according to the judgment of the valuer; and how necessary this is to an accurate judgment appears from our last week's table of weights, where three of the readings corresponding to the 'fat,' 'very fat,' and 'extra fat' condition of animal, are given, differing, it will be seen, very materially, and offering a choice which requires the exercise of considerable care on the part of the measurer. We quote the following explanation of the whole process from Mr. EWART's instructive article on MEAT in BLACKIE's Cyclopedia :—

"*The dimensions to be taken* are the length of the back of the animal, and its girth at the fore-ribs. The length should be taken from the junction of the cervical and dorsal processes," and it should extend "to that point on the upper part of the tail from which a plumb line will just include the whole of the round of beef. The girth should be taken *squarely* round the body, immediately behind the elbow of the fore leg. Both dimensions must be taken in feet and inches, with the most careful accuracy, when the beast is standing perfectly at its ease.

"*The Computation of the Dimensions.*—In the first place, to find the solid content of a cylinder, of which the girth and length of the animal are respectively the circumference and length, as noticed above :—The rule for this is to multiply the square of the circumference or girth by the decimal .07958, which is the area of the circle whose circumference is unity, and such product again by the length. Having thus found the solidity of the cylinder, the next step, to ascertain the carcase weight, is to multiply the former by some number representing the weight in stones of each cubic foot contained in the assumed cylinder. This weight we have found, from numerous experiments, to vary from about two and a half to four imperial stones per cubic foot; and by the use of which the rule will become the square of the girth in feet and inches, multiplied by the length in feet and inches, and that product again by .2 (very nearly the product of .07958 multiplied by 2½), or by .32 (very nearly the product of .07958 multiplied by 4), for the weight of carcase in imperial stones in the extreme instances of our experiments. Now, to meet the gradation in the extent of the several circumstances which occasion discrepancy of carcase weight of animals of equal dimensions, the following table of multipliers has been constructed from elements obtained in our experiments on the subject; and the classification as to breed which we have adopted therein, is the same as that used in ascertaining the carcase weight of oxen from their weight alive :—

Table of multipliers of the product of the square of the girth multiplied by the length, to ascertain the carcase weight of oxen in imperial stones—the dimensions being taken in feet and inches.

Condition of Beast.	Decimal Multipliers. Class 1.	Class 2	Class 3.
FOR BULLOCKS AND HEIFERS.			
Half fat	.23	.225	.22
Moderately fat	.24	.24	.23
Prime fat	.25	.245	.24
Very fat	.262	.26	.24
Extraordinarily fat	.275	.27	.25
FOR BULLS			
Moderately fat	.262	.25	.24
Ordinarily fat	.275	.262	.25
Very fat	.288	.275	.262
Extraordinarily fat	.32	.288	.275

FOR CATTLE NOT INCLUDED IN THE CLASSIFICATION REFERRED TO IN THE FOREGOING TABLE.

Dutch cattle require the same multipliers as those in Class 2.
Holstein bullocks fattened after having been worked in draught ... ... .22
Shetland bullocks and heifers, prime fat ... ... .2"

The result of the calculation is the weight of carcase in imperial stones. By comparing the actual and measured weights of cattle from last week, two things are, we think, apparent, namely, first that with certain unexplained exceptions there is a very considerable resemblance between them — and secondly, that the gauge such as EWART's, which furnishes a variety of readings to any given measurements, leaving the selection to the judgment of the measurer, is greatly to be preferred to one with only one class of readings, which can be true only of one set of circumstances. It will be seen that on the whole the verdict of EWART's cattle gauge, regarding the Baker Street cattle, is that they were more than 'fat,' verging, in fact, upon a 'very fat' show.

TURNIPS AS FOOD.

ON THE CONNECTION BETWEEN THE PER CENTAGE OF NITROGEN IN THE TURNIP, AND ITS QUALITIES AS FOOD FOR STOCK.

In a letter on the guano question, addressed by Mr. Caird to the editor of the *Times*, and published in that paper on the 17th November, he said :—"It is well to be publicly known that Peruvian guano, though the best guano for the production of Wheat, does not possess the same superiority over other and cheaper guano as a manure for green crops. Bolivian guano has been proved over and over again to be, weight for weight, the more effective manure of the two for the growth of Swedes."

It will be admitted that Mr. Caird has had opportunities superior to most of ascertaining the opinions of practical men on such a subject as the one in question. This conclusion, from general experience, is, too, in perfect accordance with the results of more direct experimental investigation at Rothamsted, bearing upon the points involved. Some of these have already been long ago published, and their bearings frequently pointed out; yet it may be well, when the practical question is thus brought prominently before the public, to take the opportunity afforded of reiterating, and a little further illustrating, some of the conclusions of direct experiment—which, being discordant with the doctrines currently taught on the subject, are but slowly accepted, unless when pretty obviously supported by the teachings of practice itself—but which, if true, it is the more important that they should be generally understood.

To say that the cheaper Bolivian guano is a more effective manure for the Turnip than the dearer Peruvian, is in fact to say, in other words, that in ordinary practice an artificial manure containing so large a proportion as does the Peruvian guano of the expensive element, nitrogen (or ammonia), may with advantage be substituted by those containing more of some less costly ingredient. Bolivian guano has not been imported into this country in large quantities; but it would appear that in point of composition it is intermediate between the Peruvian and that which was formerly imported from the island of Ichaboe. The average quantity of ammonia (or nitrogen estimated as ammonia) in these three kinds of guano, may be roughly taken at 15 to 17 per cent. in the Peruvian, 9 to 12 per cent. in the Bolivian, and about 7 to 8 per cent. in the Ichaboe. The phosphate of lime, on the other hand, is the highest in the Ichaboe, the lowest in the Peruvian, and in the Bolivian intermediate between the two. To manure an acre of Turnips, therefore, with a given weight of the Bolivian guano instead of the Peruvian, is to supply to the land one-third less of ammonia but a larger quantity of phosphate of lime and some other matters. It is not my object to enter upon the nevertheless, at the present time, very important commercial and economical considerations connected with the substitution of the cheaper for the dearer kinds of genuine guano—we say genuine guano, for unfortunately, owing to the enormous extent to which the adulteration of this manure is carried on, a variation in name or price is by no means certain to secure to the purchaser only a different kind of the genuine guano. Nor shall we now stop to recall attention to the particular effects of an excess of ammonia in the manure, upon the acreage yield of the Turnip crop—a point upon which the decisions of practical experience would seem daily to become more in accordance with those of more direct experimental investigation. The only points which we shall now endeavour very briefly to illustrate are—1st, that the per centage of nitrogen in the Turnip bulb can be greatly increased by highly nitrogenous manuring; 2d, that the per centage of nitrogen in Turnips cannot be taken as a correct measure of their comparative feeding properties. In reference to the first of these two points, we showed in our paper on "Turnip Culture," and also in one on "Sheep-feeding," published some years ago, the effects of nitrogenous manures in increasing the per centage of nitrogen in the Norfolk White Turnip; and it may be useful here to subjoin an abstract of the results then given in reference to the Norfolk Whites by the side of some more recently obtained with the Swede. This is supplied in the following table.

TABLE I.—Showing the effect of highly-nitrogenous manuring upon the per centage of Nitrogen in Turnips.

STANDARD MANURES.	By Standard Manures only.	By Standard Manures, with cross dressing of ammoniacal salts.	By Standard Manures, with cross dressing of Rape-cake.	By Standard Manures, with cross dressing of Rape-cake and ammoniacal salts.
NORFOLK WHITES. Season 1845.				
The standard manure, farm-yard dung ...	1.56	2.54		
Do. do., minerals only (No. 1)	1.46	2.82	1.93	2.22
Do. do. do. (No. 2)	1.58	2.89	1.89	2.44
NORFOLK WHITES. Season 1848.				
The standard manure, minerals only ...	1.56	2.08	2.36	3.20
SWEDES.—Season 1850.				
The standard manure, minerals only (No. 1) ...	1.48	1.77	2.15	2.60
Do. do. do. (No. 2)	1.30	2.20	2.24	2.58
Do. do. do. (No. 3)	1.28	1.30	2.08	2.47

The Rape-cake, of which there were in some of these cases very large quantities employed, itself contains about 4 per cent. of nitrogen; and hence the effect which it, when freely used, as well as the ammoniacal salts, is seen to have in increasing the per centage of nitrogen in the Turnip bulb. It would, however, be impossible in a mere notice of this kind to enter into any adequate explanation of the greater or less amount of increase in the per centage of nitrogen in the different cases. Some of these points we have alluded to more fully in our paper on "Turnip Culture;" and it is sufficient to say generally, that the variations depend chiefly upon the relative amounts of nitrogen in the manure, upon the season, and upon the state of maturity of the crop. It may, however, be mentioned that since the year 1845 the amounts of the ammoniacal salts have been diminished, and those of the Rape-cake considerably increased; and the effect of this upon the per centages of nitrogen in the produce is clearly seen. We have then, with different descriptions of Turnips, with different seasons, and with various proportions of nitrogen in the manure, the fact clearly brought out of a great increase in the per centage of nitrogen in the Turnip, by highly nitrogenous manuring. Indeed, we believe this result is in accordance with some of the published analyses of other experimenters; but the conclusion that has been drawn, viz., that the higher the per centage of nitrogen in the roots the better will they be as food for stock, would appear to be fallacious.

Dr. Anderson, in the report of his very elaborate investigation on the composition of Turnips grown under different circumstances, which he published in the Highland Society's Journal for 1851, apparently conforming fully to the current theory, in the more limited form of it recently put forth by Boussingault—namely, that the quantity of nitrogen is a very safe indication of the comparative values of different specimens of the same kind of food—says, "It is certain, however, that a tolerably close approximation is obtained, so long as we compare with one another similar kinds of food. Thus, for instance, to suppose a case, if we had two varieties of Turnip, one of which contained exactly twice as much nitrogen as the other, there is no doubt that their feeding values would be pretty exactly in the ratio of two to one."

There is, perhaps, no theoretical notion more currently taught, or more generally accepted, in agricultural chemistry, than that which assumes that the comparative values of foods generally are in proportion to their richness in nitrogen; and yet there is perhaps none more discordant both with common practice and with the records of direct experiment. In our various papers on sheep feeding, although at first we were ourselves to a certain extent inclined to adopt the current theoretical opinions, we have called attention to the bearing of the results on this point; and more particularly so in one on pig feeding, which will appear in the forthcoming Journal of the Royal Agricultural Society of England; as well as also in a paper now published as a report in the volume for 1852 of the British Association for the Advancement of Science. An examination of these papers, which relate not only to Turnips but chiefly to other foods, would show that by the results of direct experiment, we have been necessarily led to opinions opposite to those generally held by writers on the subject of the chemistry of feeding.

But confining our attention now exclusively to the subject of Turnips, we have given, in the upper portion of Table II., which now follows, a summary from our paper on sheep feeding (Journ. Roy. Ag. Soc. Eng., vol. x., part 1), of the results obtained by feeding sheep upon Norfolk White Turnips, which had been grown by different manures, and which contained accordingly very different per centages of nitrogen. And in the lower portion of the same Table (II.) is given a short account of the results of feeding experiments of a similar kind, not before published, in which Swedes, grown by different manures in the season of 1850, and also con-

tining very various per centages of nitrogen, were employed.

TABLE II.—Showing the per centage of Nitrogen in Norfolk White and Swedish Turnips, grown by different manures, in the seasons respectively of 1848 and 1850; and also the influence of this per centage upon the rate of consumption, and the increase of sheep fed upon them.

	By Mineral Manures only.	By Mineral Manures and ammoniacal salts.	By Mineral Manures and Rape-cake.	By Mineral Manures, and Rape-cake and ammoniacal salts.
NORFOLK WHITES. Crown Season 1848.				
Per centage of nitrogen in the dry substance	1.56	2.08	2.36	3.20
Lbs. of fresh Turnips consumed per 100 lbs. live weight per week	164 0 lbs. oz.	167 12 lbs. oz.	173 12 lbs. oz.	156 4 lbs. oz.
Lbs. of dry substance consumed per 100 lbs. live weight per week	15 5	14 1	13 10	12 5
Oz. of nitrogen consumed per 100 lbs. live weight per week	0 3¾	0 4⅝	0 5	0 6¼
Lbs. of increase in weight of six sheep in 68 days	28 0	45 0	22 0	20 loss
Lbs. of dry substance eaten to produce 100 lbs. increase in live weight	2452 4	1428 0	2583 12	
Lbs. of nitrogen eaten to produce 100 lbs. increase in live weight	39 0	29 8	60 12	
SWEDES. Grown Season 1850.				
Per centage of nitrogen in the dry substance	1.35	1.76	2.16	2.55
Lbs. of fresh Swedes consumed per 100 lbs. of live weight per week	85 10 lbs. oz.	92 12 lbs. oz.	90.12 lbs. oz.	89.8 lbs. oz.
Lbs. of dry substance consumed per 100 lbs. of live weight per week	9 5	9 13	9 5	9 0
Oz. of nitrogen consumed per 100 lbs. of live weight per week	0 2	0 2¾	0 3½	0 3⅔
Lbs. of increase in weight of 27 sheep in (about) seven weeks	114 loss	204 0	66 0	50 0
Lbs. of dry substance eaten to produce 100 lbs. increase in live weight	...	1165 0	3402 0	4475 0
Lbs. of nitrogen eaten to produce 100 lbs. increase in live weight	...	20 8	73 8	114 2

The Swedes consumed in the latter set of experiments were, like the Norfolk Whites in the former one, grown in our systematic course of Turnip experiments, upon land which has been devoted to that crop year after year since 1843; manures of the same description, but sometimes varying in the quantities employed, having been applied to the same plots throughout, Swedes being, however, substituted for Norfolk Whites, in the season of 1849, and since. For the purposes of the feeding experiment 10 tons of Swedes were weighed out from the produce of each of the four descriptions of manure indicated in the table; and each of these lots of 10 tons, the produce of a particular kind of manure, was allotted to 27 sheep. The four sets were folded side by side in a Grass field (which had previously been fed down quite close); and no other food was allowed, though of Swedes, after being cut, they were permitted to eat as many as they chose.

It is seen that whether we look to the amounts of constituents consumed by a given weight of animal within a given time, or to those required to produce a given amount of increase—there is a considerable difference between the results of the Norfolk Whites and the Swedes, in the quantities both of the nitrogen and of the total dry substance consumed under equal circumstances, the amounts required in the Norfolk Whites being always much greater than in the Swedes. Thus, taking the results of each variety of Turnips separately, and looking first to the amounts consumed by a given weight of animal within a given time, there is much less of uniformity in the quantities of nitrogen so consumed in the Turnips grown by different manures, than there is in those of either the fresh Turnips or the dry substance.

Looking next to the question of the amount of constituents required to produce a given result, and taking first the results of the Norfolk Whites, we see that, excluding those grown by mineral manures only, which were too far grown and "pithy,"—those of the other three lots, which contained the lowest per centage of nitrogen, and in which the animals consumed the least of it, gave the greatest increase; whilst the sheep fed upon the Turnips containing the highest amount of nitrogen lost instead of gained in weight. The result with the Swedes is very similar. In this case, however, there is an actual loss of weight, upon the Turnips grown by mineral manures alone—which, being much too far grown were not only, like the Norfolk Whites upon the same manure, very pithy, but they contained a per centage of nitrogen below the usually observed amount. Again, excluding, then, this lot, we find, that of the other three those Swedes containing the lowest per centage of nitrogen gave the best result, and those containing the highest per cent. the worst result.

Further, when we compare the amounts of food consumed to produce a given amount of increase in these experiments, with the amounts in other cases with foods of known superior quality—it is evident that those Turnips which in each set of experiments respectively gave the best result, were, notwithstanding the somewhat artificial circumstances of their growth, well adapted as food for stock. But it is equally clear that in all the other cases the bulk of matter which the animals were enabled to take into their stomachs contained barely enough of the important digestible non-nitrogenous constituents of food, to support the natural functions of the body.

We cannot, however, enter into a detailed consideration of the circumstances probably affecting the comparative feeding value of the Turnips, in the different cases—any more than of those yielding the particular per centages of nitrogen observed in the Tables—in, as we have said, a mere notice of this kind. Our only object at the present time, is, whilst the subject of the effect of highly nitrogenous manuring upon the Turnip crop is before the public, to fix attention upon the general facts so clearly brought out in the experiments quoted—namely, that the per centage of nitrogen in the Turnip is very much increased by the free use of highly nitrogenous artificial manures—and that a high per centage of nitrogen in the Turnip is no sure indication of increased feeding value—but, on the contrary, that such an increased per centage beyond a somewhat narrow limit would seem to be injurious. *J. B. Lawes.*

Home Correspondence.

Gorse Cover.—In answer to inquiry by "Fox" as to how to get up a Gorse cover, I should recommend the following plan :—First, have the ground dug 2 feet deep, that is, the upper and sub-soil dug, and then sow it with Oats and Gorse together, and cut the Oats when ripe. I have obtained a much better plant of Gorse by sowing with Oats than without. Gorse should not be put in too forward; being delicate, it is apt to be hurt by the frost. April is a good time. *Venator.*

Storing Swede Turnips.—This operation, like many others, has not yet attained to perfection, nor have your excellent correspondents the writers of the Calendar (as far as I can recollect), alluded to this subject at such length as would justify others in adopting their methods. It is therefore with the view of bringing it under their notice that I have recurred to the subject, and hope you will kindly devote a little space to what may be considered the best methods known of preserving the Swede till spring. Hitherto I have selected the following as being the safest way, viz. :—The first thing done is to select a piece of dry ground in the most convenient place ; then the Turnips (which should be ripe) are pulled and carefully topped, tailed, and led in dry weather, when they are piled in heaps about 6 feet wide at the base and 3 to 4 feet high ; these proportions in my opinion are the most convenient for covering, which should consist of short loose straw, and be laid on first about 6 inches in thickness, then covered with a coat of long straw about 2 inches thick, which should be laid on in the manner of thatch, and tied down with small ropes, and fastened in the sides or to the ground with pegs. The portion of the Turnip crop which is to be consumed on the land by sheep towards spring we protect in the following way :—The double mould or other plough is introduced between each drill a good depth, so as to cover the bulbs completely with a smooth furrow, in which state they are protected both from severe frosts and draughts, as the latter in spring are equally injurious. Towards this period they will begin to grow, and take severe hold of the land, when they are uncovered by heavy harrows, and collected into small heaps, which may be covered over with straw or with shaws until they are eaten off at seed time. Were they allowed to remain fixed by the roots even for a short period at this time of year, much of the nutritive properties would be lost by being converted into woody fibre. *P. Deane, Houghton, Dec.* 19.

Gas Lime.—In your last number's "Notices to Correspondents" I find—"Lime fresh from the kiln and gas lime are not capable of comparison. The latter is to be had cheapest (money value) and it is generally, we believe, intrinsically worth more than the other. Its value arises from a portion of it having been so acted upon, that by subsequent exposure to the air that portion becomes gypsum." Some years ago I applied to Professor Johnston, then chemist to the Agricultural Chemical Association of Edinburgh, for his opinion on the relative value of these articles ; I subjoin his reply. I should be glad to have your opinion as to its correctness, or whether it can be reconciled to the preference you give to gas lime, on the ground of its convertibility to sulphate of lime—"Unless you had sent some of the gas lime for examination, it is impossible to give an exact answer to your question ; but, from the examination of other gas limes, I suppose that yours may consist in a cwt. of about—water, 56 lbs. ; carbonic acid, 20 lbs. ; lime and sulphur, 36 lbs. ; total, 112 lbs. ; so that in 112 lbs. you have only 36 lbs. or thereabouts of lime such as you get it from the kiln in the state of shells." *C. Ley.* [We do not think that Professor Johnston's reply is inconsistent with ours. His "lime and sulphur" will, by exposure to air, become "gypsum," so that ultimately a certain portion of the whole is gypsum and the rest chalk, in such a mixture as is, we believe, worth more per ton in our market than an equal weight of lime shells at the kiln. The two, however, differ altogether in their uses, and hence are not capable of comparison directly, *i. e.*, one may be useless and the other useful, and *vice versâ*, according to the circumstances of the soil to which they are to be applied.]

Steaming Hay.—Steam being an excellent searching cleanser, I willingly store up the fact that it is a good means of sweetening spoiled hay ; but I wish to be informed how sweet hay is improved by steaming ? I can understand how vegetables with much starch (such as Potatoes) are improved by this operation, the starch being rendered soluble, which we know it is not in cold water. I believe the quantity of starch in hay is not great ; are the flesh-forming substances improved as food for cattle by being cooked ?—or are they only rendered more palatable, like Bean and Wheat straw ? *W. S.* [It does improve things that are not spoiled—at least, cattle think so. Try its effect on good clean Oat straw chaff—it improves the smell, and we doubt not the flavour too ; and so induces the cattle to consume more than they otherwise would, though we do not suppose it is intrinsically more nourishing from the process.]

Interest on money borrowed for Draining.—There is at this present time much agitation amongst tenant farmers of lands in my immediate vicinity ; a locality from its elevation causing a climate wet and late in its seasons ; and, on that account, almost exclusively confined to permanent Grass. The remarks I here wish to call attention to are upon the charges made for interest upon the public money borrowed to be expended in underdraining. This excitement, so far as I can judge, will seriously here increase, and I much fear must cause the ultimate abandonment of many of the holdings, held for generations past, unless great sacrifices be made by the owners of the soil. This state of things has all arisen for want of a little thought, as poor Richard says in his "Almanack," in not taking into consideration the vast difference between Grass and arable lands; for I hold this as an incontrovertible axiom, that the larger the expenditure necessary to produce and reap the crops, the larger the margin for the cost of permanent improvement. I trust some of your correspondents will canvass the subject more fully, and not allow me to be led away to assert that it is rare to find land in Grass for tenants to pay fair interest for deep drainage improvements even upon that of the first quality. I speak from long experience as a landlord. *C. P.* [We do not imagine that many will agree with you. Undrained pasture lands will generally benefit by draining sufficiently to pay for it, unless the work be done injudiciously or expensively.]

Rice.—A letter in your paper to the purport that Rice is neither good for, nor popular with, the peasantry of England, has caught my eye. I beg to say that in my parish I have for many years sold rice at cost price, or may be rather less, to the poor around me. It has been bought eagerly by an ordinary agricultural population. I attribute this to their being taught to cook it properly, which I have taken pains to do with the girls in the village school ; and I have traced the taste for this useful article of food, and the knowledge of its value, to the school, and the manner there inculcated of soaking Rice overnight, and slowly simmering it for hours before it is eaten, adding such flavouring as can be afforded. A little Oatmeal mixed with the Rice removes all astringencies, and makes it more agreeable to some palates. I think it is really of importance that Rice should be understood in a season of so much scarcity and high prices. *A Country Squiress.*

Farmers' Clubs.

LONDON : Subjects for discussion, 1854. Chairman for the year, W. Fisher Hobbs, Esq :

	Proposed by
February 6.—The present imperfect mode of taking the Corn Averages. (It is proposed to follow this up by a deputation to the Board of Trade on the day after the discussion. A general invitation is also given to the members of local farmers' clubs to attend this meeting)...	Mr. W. PAIN, of Compton, Winchester.
March 6.—Agricultural Statistics, and the best Mode of Collecting them	Mr. W. BENNETT, of Cambridge.
April 3.—On the Application of Manure in a Liquid State—to Roots, Grasses, and Grain Crops	Mr. W. C. SPOONER, of Eling, Hants.
May 1.—On the Diseases and Blights affecting Plants, and the best Means for their Cure or Prevention	Mr. R. BAKER, of Writtle, Essex.
June 5.—The present Policy of our Labourers' Friend Societies	Mr. J. C. MORTON, Upper Wellington St., London.
November 6.—How can the Letting and Hiring of Land be effected to best insure the General Interests of the Community at large?	Mr. S. CHEETHAM, of Tugby, Leicester.
December 5.—On the Results arrived at from the several Systems of Drainage in Practice during the last few Years ...	Mr. J. BAILEY DENTON, of Gravely, Herts.

The discussions will commence at half-past Five o'clock, P.M. There are no meetings for discussion in January, July, August, September, or October.

Poultry.

THE METROPOLITAN SHOW.—We believe we must at last discontinue the use of the term "poultry mania." That which has continued during a period of five years with increasing interest may safely lay claim to a more rational appellation, and must rest on a more solid basis. It is now proved beyond a doubt that the previously neglected question of poultry has assumed that measure of importance which legitimately belongs to it. In addition to the pleasure derived from keeping poultry, the friendly competition at exhibitions, while it offers an inducement to breed superior birds, at the same time provides a remunerating market for them. These shows also form an immense "conversazione," where amateurs meet, where knowledge and experience are acquired and communicated; where points are defined, and where the utility and profits of the various breeds are settled. For these reasons, to describe the different shows as they occur, is to chronicle an uninterrupted course of success ; save cases where, perhaps, three very small shows fill the space, which would be more profitably occupied by one larger. This is, however, for the consideration of the local committees, and does not impugn the justice of our preceding remarks.

The great Metropolitan Poultry Show of the past week had 1139 entries of poultry, 425 pens of pigeons, and 50 of rabbits, making a total of 1614 competing pens. There lacked not beautiful and perfect specimens of almost every breed, although some of the most celebrated exhibitors were prevented by the snow-storm of last week from sending up their birds. Following the classification adopted at Birmingham, the prize list opens with adult Spanish, producing 15 competitors. The prizes were awarded in order to Messrs. Fox, Botham, and Fisher. The chickens numbered 36, and Messrs. Plummer, Owen, and John Taylor, jun., took the prizes. Miss Shaw, and Messrs. Botham and Crawther were commended. This brings us to a novelty in prize lists, namely, two classes, one for a single cock and one for a single hen. The two prizes for cocks were awarded to Mr. Davies, of Hounslow, and Mr. Rake, of Bristol. For the hens, Mr. Plummer, of Bristol, and Mr. Mold, of Belper. Nowhere is the increase of competition more perceptible than in the Dorking classes ; in that for a cock and two hens there were 27 entries, and here the prizes went to the well-known names of the Rev. Mr. Boyes, Mrs. Finch Noyes, and Mr. W. Smith. In the sixth class, for a cock and two pullets, were 48 pens, many of them of great merit. The difference in the prize pens was but trifling, but they were taken as follows :—Mr. Smith, Mr. Terry, and Mr. Boyes. The next was the competition confined to cocks only, and here both prizes were easily gained by Mr. Fisher Hobbs. A pen of this gentleman's birds was purchased for his Royal Highness Prince Albert. Those for hens were awarded to the Rev. J. Boyes and Mr. Bleabitgton. Although the White Dorkings were as usual weak still there was an improvement. The awards in the two classes were to Messrs. Edwards and Jennens, and Messrs. Rawson and Davies.

We now enter upon the Cochin China classes, which have added to the success that seems to belong to some breeders, and especially to Mr. Fairlie. In class 11, from 21 exhibitors, Mr. Fairlie took both the first prizes. The honour of carrying off the first in class 12, where 134 pens entered the list, belonged to Mr. Steggall, of Weymouth ; second and third went to Mr. Fairlie. The numbers of competitors in some of these classes must, of necessity, weaken the others, and in 13 there were only 13 entries—in 14, 20. Here the awards were in favour of Messrs. Bridges, Fairlie, and Strutt ; and Messrs. Fairlie and Chater. Class 15 again presented a large array of entries, 81 in number. It was for a cock and one hen of any colour. This will always be a favourite arena ; numbers of amateurs can show a capital pair, who would not dare to hope for success, if it were necessary to produce four birds. The judges had but two prizes to award among these numerous competitors, and, after much labour, they went to Messrs. Gilbert and Gandy. The best white Cochin Chinas in class 16 belonged to Mrs. Herbert, Messrs. Reynolds and Rake, and were rewarded accordingly. The chicken class produced 25 entries, and added another triumph to those already recorded of Mr. Eason, Mrs. Herbert, and the Rev. S. Allen. The adult class of blacks was weak, and only one prize was given—to Mr. Fox. But in revenge 19 pens of chickens were sent ; this we believe is one of the largest classes yet seen of these beautiful birds. Every bird was taken out and accurately inspected in strong light, and the result was, that five cocks were found without apparent foul feathers. The prizes were awarded to Mr. Blake, of Birmingham, and Mr. Harding. Next came the contest for the best cock. Twenty-four birds competed, and Messrs. Rawson, and John Taylor, jun., took the honours. Forty-one hens were entered in class 21, and Messrs. Fairlie and Emery were successful. Next in order is the great novelty, viz., a class for Brahma Pootras. These birds after a long occasional appearance among the anomalies that make up the "various" class, have taken their stand as public favourites, and heading their list with the name of H. R. H. Prince Albert, brought 34 competitors. The first prize was gained by a pen of transcendent merit, which far outstripped all others, and belonged to Mr. Davies, of Spring Grove, Hounslow, and the second by a capital pen belonging to Mr. Gilbert, of Kensington. The Malays were better than usual, and the prizes went to Messrs. Cricket, Hedges, Leighton, and Owen.

The length to which a report runs, necessarily compels us to condense some of the more numerous classes, such as the game, but one thing will excuse it in this instance, which is, that the same birds are successful whenever their owners send them, thus showing that the necessary qualities insure success. First prizes for these birds were taken by the Rev. T. L. Fellowes, Messrs. Hatfield, Thumall, Lowe, Jennens, Choyce, and Fairhead. Second, by Messrs. Monsey (3), Farmer, Adkins, Vivian, and Freere. The golden pencilled Hamburghs merited a commendation for the whole class. The first prizes were awarded to the Rev. F. W. Freeman in both the adult and chicken classes. The second to Mr. Rawson and Mrs. Mills. In gold spangled, the first prize went to Mr. Mold and Mr. Henry Fookes ; the second to Mr. Adkins and Mr. Dixon. The adult class of silver pencilled was not a good one. The only prize awarded was to Mr. T. M'Cann. The chickens, however, made amends, by exhibiting in numbers and quality that justly gave them importance. After much competition, the Rev. F. W. Freeman and Mr. Aberdein were successful. Classes 39 and 40 of silver spangled Hamburghs were also excellent, and we were glad to notice the absence of the hen-tailed birds, evidently crossed with laced bantams. The Rev. T. L. Fellowes, and Mr. Edwards, of Bulstrode, took first, and Messrs. Jordan and Dixon second prizes. The first prize for Black Polands with white crests, as usual, was taken by Mr. Adkins, of Birmingham. In chickens, Mr. Edwards, of Bulstrode, and Mrs. Mills, were successful. Class 43, for golden Polands, awarded their favours to Messrs. Bush and Rawson. Class 44, chickens of the same, to Messrs. Vivian and Kostin. The next in order were the silver Polands, and a beautiful class : Messrs. Adkins and Baker took the prizes ; the chickens were equally meritorious. Messrs. Edwards, of Bulstrode, and Boulnois, jun., were here successful. The honour of class 47 went to Messrs. Dutton and Fairlie, and Mr. Vivian took both prizes in class 48. The various classes were rich in its curiosities, and the following were distinguished by the judges :—Mr. John Taylor's Andalusians; Mr. H. F. Davies's Rangoons ; Mr. Higgs's, of Southampton, birds ; Rev. T. L. Fellowes' black Hamburghs. Second prizes : Mr. Fairlie's dum-

pis; Mr. Vivian's frizzled and Normandy; Mr. J. C. Mold's rumpless.

We are bound to express our continued disapprobation of the next prize, viz., one for cross-bred birds. Judges cannot give satisfaction in such a class, as they have no rule to guide them; one prize was awarded to Mr. Thomas Sheen. The Bantams were good, but not equal to many exhibitions we have lately visited. The first prizes, both in gold and silver, went to Mr. Uriah Sharey. The second to Messrs. Adkins and Mousey. In white, first to Mr. W Curtis; second to Mrs. Caroline Brace. In black, first to Mr. Mousey; second to Mr. F. L. Astley. We are bound to mention in the class of "any other variety" some beautiful duck-wings, such as we saw last year, and which deservedly took first prize; the second went to Mr. Vivian for some remarkably handsome speckled and top-knotted birds. The geese were not a very good class; both prizes were gained by Mr. Williams, of Reading. Aylesbury ducks were excellent; Messrs. Terry and Brevington took first and second. Messrs. Green and Brooksbank were the successful competitors in Rouen; Messrs Fairlie (2), Botham, and Taylor in other varieties. It is almost unnecessary to say that Mr. Fairlie took the two first prizes for turkeys. Mr. Williams, of Reading, took the third. The show was deservedly successful, and all concerned exerted themselves most laudably. Their energies were put to the test, as Mr. Catling, certainly one of the most indefatigable secretaries in England, was absent from illness. The judges were—E. Hewitt, Esq., Eden Cottage, Spackbrook, Birmingham; W. Symonds, Esq., 6, Belfield Terrace, Weymouth; Mr. John Baily, Mount Street, Grosvenor Square. We should add, the commendations were deservedly so numerous, we must refer our readers to the prize lists for them. We would also warn exhibitors that in classes for cocks and two hens, disqualification follows if an extra hen is shown. Much trouble will be avoided, both to committee and judges, if more pains are taken in sending Hamburghs, to be sure they are accurately described, as it constantly occurs that pencilled are entered for spangled, and *vice versâ*.

Calendar of Operations.

JANUARY.

Forfarshire Glens.—During the past two months the weather has been very changeable, but, upon the whole, seasonable and favourable for farming operations. The miserable remains of the grain crops were carried home about the middle of November; the produce is even more deficient than during harvest was anticipated; no drying winds have come to carry off the superfluous moisture, consequently the deteriorating process has been still going on, and good seed and good meal will be valuable in this quarter before May month. Ploughing stubble and lea has progressed with but little interruption since harvest, and the work is well forward. Turnips have improved vastly, and, although not a full crop, are much better than was at one time expected; they are now being taken up and stored when weather will permit, to save them from the vermin, and to have a supply during frost. Feeding stock have improved apace, the Turnips having been generally fresh, and the weather mild. Where there is rough pasture, the young cattle still go out so long every day; good fodder is likely to be scarce before the end of winter, and is now carefully husbanded. The sheep are now generally gathered from the glens, well conditioned and healthy, and sent to winter quarters, in flocks of from 300 to 400 each, under the charge of one man and two dogs. Besides protecting and feeding the flock, the shepherd has to attend to the state of the fleece; so soon as any begin to break in the wool, from whatever cause, a remedy must be immediately applied. We find winter keep becoming yearly more difficult to be got. Many tenants of arable farms are prohibited from letting the foggage of their fields for sheep, as it is said, lest the sheep should break down the fences; but some would infer the true cause to be, lest the shepherd and his dogs should disturb or kill the game. The tenant is bound by his lease to keep up the fences; it therefore appears rather absurd that he should be denied a means of improving his farm and increasing his income for fear of breaking them down. We have been often told that the interests of landlord and tenant are one, but we feel the contrary. Doubtless it is the interest of both that the soil should be brought under the best system of cultivation, and made to yield the greatest amount of produce, but that is not always kept in view; smaller interests often press in from both sides, and mar the business. A sporting laird will prefer abundance of game and good sport to abundant crops and good husbandry. A narrow-minded tenant will prefer a small present advantage to a large one more remote, and will therefore often save his money when he ought to expend it. Farm letting is now-a-days quite a commercial transaction, and there the interests of landlord and tenant are as directly opposed as those of buyer and seller. As a general rule, the highest offerer is preferred, if he is supposed capable of fulfilling his engagements; but if the landlord would look to his own true interest, he would have regard to something else in his tenant besides the likelihood of his paying the rent. He should, if possible, choose a man of character, of education, and of some practical knowledge of his profession. Without the first he will, right or wrong, turn everything to his own advantage, and will prove to his landlord a continual source of annoyance; without the second he will rarely make progress; and without the third his progress, if any, will likely be in an unprofitable direction. Every landlord is entitled to the full value of his land; but if at any time he shall choose a tenant merely because he is the highest bidder, without regarding the other essentials, ten to one but at some future period he must repay all—and more than all—the additional rent he gets by so doing. A lease, like every other bargain, ought to be fully explained at once, and bear upon the face of it every payment of every kind which the tenant is required to make in the name of rent. The landlord has no right to come in at an after period with a demand for the performance of extra labour, for butter, cheese, and chickens; because at one time these, and similar payments in kind, constituted the rent, and have in many cases continued to be paid in addition to the rent. Whatever the landlord requires, either in labour or produce, beyond what is specified in the "tack" ought to be paid for; and when a lease is entered upon, the tenant ought to be as independent in his own sphere as the landlord is in his—nothing should be extorted by, and nothing yielded to, the mere force of influence. Up to Christmas-day, which was very fine, winter had only been seen waving his banners on the distant hill tops; since then he has come down upon us in his fiercest form—intense frost, heavy snowshowers, and strong north wind. The weatherwise say it is too severe to continue long; wise may they be. *S.*

Rhins of Galloway, *Jan.* 10.—Until yesterday ploughing has been at a standstill for nearly a fortnight. We have had a thaw for two days, but frost has again set in, which will be injurious to the young Wheat, much of which being late sown is not yet above ground. There has been a larger breadth of Wheat sown this season than on many former ones, the great desire being with most farmers to have it sown before spring, as that which was deferred till then has proved most deficient both in quantity and quality for several years past. Grain has been threshed off freely, to supply stock with fodder; it has required a much larger supply of food than usual to keep young stock in condition during the severe weather. Feeding stock are progressing satisfactorily, though in some cases they have suffered a little from not having a sufficiency of Turnips stored to meet an emergency; it should always be a first consideration in good management to make provision for any contingency which is likely to arise. Sheep and Turnips have had rather hard times of it of late, though they have had one advantage—having a dry bed. Several lots of feeding cattle have been sent to the Glasgow market, and realised good prices, from 50*s.* to 60*s.* per cwt., according to quality. Fat sheep have been making 7*d.* per lb., so that even with the high inlaid price of feeding stock, they are leaving a fair profit. Grain markets are still on the advance; 9*s.* per bushel can now be obtained for Wheat of good quality; and Oats are worth about 3*s.* 2*d.* per bushel. Work for labourers is plentiful; but of late they must have been pretty hard up, draining and other outdoor work not being able to be proceeded with, which is the more to be regretted, as the price of provisions is very high. We are much gratified to see that you propose giving a more full account of grain and cattle markets than usual, which will be a great boon to most of your readers.—[Only in the Monday's edition.]

South Lancashire.—We have closed the past eventful year of 1853 and commenced the new year 1854 with a very severe frost and a great quantity of snow, so much so that all our canals are impassable, and that the ice could not be broken this morning with even eight or nine horses, causing scores of flats laden with coals and other commodities for Liverpool steamers exportation, and the great Northwick salt works to be at a standstill. The contents of our stack-yard are fast being diminished. Hay is rising, although very inferior to past years, owing to the wet weather. Milk cows are selling high, and milk has a tendency to partake with other articles. Butter, too, has risen from 10*d.* to 1*s.* 3*d.* and 1*s.* 4*d.* per lb., whilst store pigs are selling at enormous prices, considering the high price of produce which parties will have to pay for their keep, and taking into account the vast number of pigs and their sties which have been ordered to be removed out of our large towns on sanitary grounds fat pigs are realising something like 6½*d.* and 7*d.* per lb., eggs 9 and 10 for 1*s.*, and poultry equally as dear. Winter fruit is also selling well, but scores of farmers have none to sell, where formerly they had loads to dispose of, owing to the obnoxious vapours from upwards of 40 copper, chemical, and alkaline works in the St. Helen's and Wigan districts, and which continue to do everlasting damage to all around, for last year we had four red carts newly painted, and within the last month they are all turned lead or slate colour. Our varnished Whitechapels are also turned, but into what colour no one can tell. Our brooks at present are a treat, for the ice is blue, green, black, white, or chocolate, and, indeed, almost every colour you could name, and that within the space of 100 yards; our field gates, door posts, and window frames, are all one uniform lead colour; our pocket keys, silver, copper, and even gold is instantly changed in our pockets; our coppers, brasses, and chimney ornaments are also varnished a Wimeberry colour. Such is the awful state of South Lancashire. On foggy mornings our macadamised roads are to all appearances tarred over by its devastating influence; what then must it be to our cattle and the tender family of the vegetable kingdom? Our Wheat crops in past years have been good, and the yield from 15 to 22 loads per Cheshire acre very frequently obtained, but this year the yield is proved and admitted to be from 4½ loads to 9 loads per Cheshire acre, only one side of the growing Corn and straw being affected. Oats and Barley suffered much from the bad weather, and the yield is much below former years, thanks for a slight increase of prices which makes up the deficiency. Turnips and Mangold Wurzel are but indifferent crops—much below the average, but it is our painful duty to record that during the past season several seedsmen have sold Scarisbrick and Cauliflower seeds for Improved Swede seeds, and many farmers have been great sufferers in consequence. This ought not to be, particularly by seedsmen professing to be classed amongst respectable tradesmen. Bones and superphosphate of lime are very much in demand in Lancashire. Agricultural day labourers are mostly out of employ, whilst farm servants are kept busily engaged in the barns. Sheep are scarce at moderate prices, and cheese is somewhat dearer. *J. A.*

Notices to Correspondents.

Barley and Wheat: *L P.* We do not know how you can separate them. Some sorts of Wheat would pass through a riddle which would retain Barley, and *vice versâ*.

Capital: *A Sub.* From 5*l.* to 15*l.* per acre! Positively, that is the only answer to your question as you put it. If you will tell us the quality of the land, and how you intend to manage it, something more explicit might be stated in reply.

Covered Corn Yards: *A Welsh Farmer* will oblige us by forwarding his address, and we shall then be able to send him a communication on the subject by post.

Damp in Buildings, &c.: *A Continental Subscriber*. In order effectually to provide against damp, you must take care that your foundation be perfectly drained, so that your walls may stand on a dry base. A course of slates interposed above the footings, or a layer of asphalte from ¼ an inch to an inch thick, would effectually prevent the rising of any dampness from the ground. Where neither slates nor asphalte, or the chief substitute for the latter (the pitch of coal tar), can be obtained, cement will be beneficial. The true preventive, however, is the perfect drainage of the foundation. A wall built hollow of two brick-lengths will, of course, be stronger than one of a brick and half. If brick and half be adopted, the half brick should be inside, and the two tied together by heading bricks. Not knowing the thickness of the brick, I cannot give a diagram showing the construction of the wall. It may be well to remark that, if the walls are well plumbed and cleanly built, the space between the outer and inner walls does not require to exceed 1½ or 2 inches. *J N.*—As to drains, the pipes must be placed end to end *close* to one another; the junctions will not be so tight as to hinder the entrance of water. The sum of all the spaces left for entrance by the tightest joints in the whole length of an ordinary tile-drain is much greater than the space for egress afforded at the termination of the drain. Blackie's Cyclopedia will, we hope, be concluded in two or three months.

Duty on French Wines: *J R S O.* The relationship of this matter to English Agriculture is really so very slight that we cannot in justice to other subjects enter upon its discussion.

Gas Lime: *G W L.* Most of the ammonia is taken up by the water in the purifying apparatus. The lime absorbs the sulphuretted hydrogen, and will to that extent become, by exposure to the air, gypsum. You should lay it in a heap and turn it frequently over, and by and by spread it, a ton or two per acre, over stubbles before ploughing.

Lamps: *L P.* For lampas, lance the bars of the mouth; burning is cruel and unnecessary. *W. C. S.*

Libraries for Villages: *Clericus.* We should have added to our former list "Spade Husbandry," by Alexander Yule, of the Palace Farm, Armagh.

Saturday's Edition: *W F G F.* You will no doubt have discovered before this that your remonstrance is founded on a mistake. The markets are reported as before—their position in the Paper only being altered.

Spring Wheat: *T P.* The true Triticum æstivum is a bearded red Wheat, called April Wheat, but varieties of T. hybernum have acquired habits of early maturity fitting them for spring sowing; among these the best is Le Couteur's Talavera.

DRAINAGE AND IRRIGATION.

HENRY WEBBER begs to inform Landowners and the Public, that having had several years' practical experience, he is prepared to undertake the Drainage and Irrigation of Estates upon the most improved principles, either by Contract or on Commission. Reference given.

H. W. wishes particularly to call attention to his improved and inexpensive method of Irrigation, whereby, at an outlay of a few pounds an acre, he can convert land having a sufficient quantity of water at command into water meadow, which may be mown every year without the application of manure. Any further information will be given on application.—Halberton Court, near Tiverton, Devon.

A GENTLEMAN of extensive literary and scientific attainments, and of experience in tuition, offers to teach the Sons of a respectable Farmer various branches, including Agricultural Chemistry. He might consider board and lodging an equivalent for his service.—M. W. M., Post Office, Southport.

WANTED, for breeding purposes, high bred BOAR and SOWS. They should be of the most celebrated strains of the various breeds, and the pedigree must be capable of proof. The Boar must be a remarkably fine one, and the Sows must be finely made, and be good mothers.—Address, William ——, Esq., Post Office, Kinson, Dorset, with particulars and prices asked.

DO YOU BRUISE YOUR OATS YET?—New Oat Crushers, 2*l.* 15*s.* 6*d.*; ditto, 4*l.* 5*s.* 6*d.*; Chaff Cutters, 1*l.* 7*s.* 6*d.*: ditto, 2*l.* 19*s.* 6*d.*; Mangles, 2*l.* 10*s.* 6*d.*; Flour Mills, 4*l.* 10*s.* 6*d.*—Mary Wedlake & Co., 118, Fenchurch Street.

THE BEST FOOD FOR PIGS.

DAMAGED WHEAT AND RICE MEAL is now acknowledged to be the best and cheapest FOOD FOR PIGS. References can now be given to the largest feeders in England, and to several who won prizes at the last Smithfield Cattle Show. In order that small consumers may test the merits of each, 1 quarter of Wheat and 2 cwt. of Rice Meal will be sent for Post-office order of 3*l.* 2*s.*, including sacks.

DAMAGED WHEAT ... ... 36*s.* per qr.
RICE MEAL ... ... 9*l.* 5*s.* per ton.

James May & Co., Finsbury Wharf, City Road Basin, London. Delivered to any Railway in London. 1*s.* 6*d.* each charged for Sacks.

TO MARKET GARDENERS AND OTHERS.

TO BE LET, with immediate Possession and liberal terms, about 8 Acres of good and productive GARDEN GROUND (the Stock on which is good and saleable), situated within three miles from town, with every facility for carriage to the Markets, comprising Dwelling-house, Stabling, Piggeries, and convenient Out-houses.—For particulars, apply to Phillips & Son, Auctioneers, 24, Chiswell Street, Finsbury, London.

ASPARAGUS FOR FORCING.

TO BE SOLD, by Private Treaty, 3 acres of very fine Roots, of four years' cutting, at an easy distance, seven miles west of London.—Apply to E. H., Post Office, Burfield's, Strand, London.

CHELTENHAM EXHIBITION, 1854.

To Parties about to Erect Conservatories or Public Exhibition Rooms.

TO BE SOLD.—At the end of July, the BUILDING now constructing in Cheltenham for the Crystal Palace Exhibition of Horticulture will be disposed of either in one or more Lots, to suit the convenience of Purchasers. It will comprise 20,000 superficial feet of Lights, in sizes suitable for Conservatories, Greenhouses, &c., made of the very best materials, and glazed with 16 oz. Sheet Glass. Parties contemplating the Erection of Exhibition Rooms or Greenhouses and other Garden Works, will find this a rare opportunity for providing themselves with the most expensive portions of such undertakings at a low price.—Applications to be made to Mr. G. Parsonage, Builder and Undertaker, Cheltenham.

WHITE FACED SPANISH FOWLS.

TO BE SOLD, a few COCKERELS and PULLETS of the above breed from a Cock bred by Capt. Hornby and Prize Hens.—Apply to Mr. John Read, Churchyard, Boston.

COCHIN COCHIN FOWLS.

MR. J. C. STEVENS will Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, 24th January, at 12 o'clock precisely, PRIZE COCHINS, buff colour, from the yards of J. Harrison, Esq., of Snelston Hall; G. W. Johnson, Esq., of Winchester; and Mr. Griggs, of Holloway, many of which especially deserve the attention of amateurs.—Catalogues by enclosing a stamped directed envelope to Mr. J. C. Stevens, 38, King Street, Covent Garden, London.

NURSERY STOCK, WEELEY, ESSEX.

R. G. CRASKE respectfully announces that the Sale of the above Stock, which was postponed on account of the heavy fall of snow, after about 300 lots had been sold, will be resumed on WEDNESDAY next, Jan. 18, and two following days, and the whole will be disposed of without the least reserve.—Catalogues may be had of the Auctioneer, Observatory House, Colchester.

TO NURSERY AND SEEDSMEN, FLORISTS, AND CAPITALISTS.

MESSRS. ACTON & SON will Sell by Auction, at the White Horse Inn, Coppergate, York, on TUESDAY, the 24th January, 1854, at Two o'clock in the afternoon, for Three precisely (unless previously disposed of by Private Contract, of which Notice will be given), together, or in the following, or such other Lots as may be determined upon at the time of sale.

LOT 1.—Part of the VALUABLE NURSERY GROUNDS situate in Fulford Road, York, and adjoining on Property of James Backhouse, Esq., containing 8A. 3R. 32P., well stocked with every variety of Choice Forest and Fruit Trees, Shrubs, Roses, &c., in vigorous growth. Upon this Lot, fronting the Fulford Road, is erected a Modern and Commodious DWELLING-HOUSE and SHOPS, with GREENHOUSE and other requisite OUT-BUILDINGS adjoining.

LOT 2.—The remaining Part of the NURSERY GROUNDS, containing 4A. 3R. 24P., lying between Fulford Grange and Lot 1; and also those two Substantial DWELLING-HOUSES, constituting neat and pleasant suburban residences for small families, with suitable OUT-OFFICES attached, also fronting the Fulford Road. The Land extends from Fulford Road to the New Walk, adjoining the river Ouse, is of freehold tenure, of first-rate quality, in a high state of cultivation, and comprises valuable beds of gravel. The late proprietor, Mr. George Clarkson, for many years carried on an extensive and flourishing business on the premises, and a most eligible opening is therefore presented for any person desirous of succeeding him. The Property is also well worth the attention of capitalists as an investment, the whole being available for building purposes. The purchaser may, if preferred, take the Stock, or a portion thereof, on liberal terms, and have immediate possession.—Further Particulars may be had, and Plans of the Property seen, on application on the Premises, or at the offices of Mr Luke Thompson, Solicitor, Judges' Court, York.

ESTABLISHED ABOVE SIXTY YEARS.

ROBERT METTAM, BRITISH and FOREIGN WHOLESALE WINDOW GLASS WAREHOUSE, 30, Princes-street, Leicester-square.

16 oz. Sheet Glass in Boxes of 100 feet.	Sheet Glass cut to size, not exceeding 40 inches.
Under 6 ins. by 4 ... 1¼d. p. foot.	16 oz. ... 3d. to 3½d. per foot.
6 by 4, under 8 by 6, 2d. „	21 oz. ... 3½d. to 5d. „

"There *can be no question now* that Rough Plate Glass is the most beautiful, as well as the most useful, kind of glass that can be employed in horticulture. It is free from all the faults of sheet or transparent glass, and it has many advantages peculiar to itself, *without a single disadvantage as a set-off.*"—*Gardeners' Chronicle.*

JAMES PHILLIPS & Co., Horticultural Glass Merchants, 116, Bishopsgate Street Without, London.

GLASS FOR CONSERVATORIES, GREENHOUSES, DWELLINGS, ETC.

ESTABLISHED MORE THAN ONE HUNDRED YEARS.

Warehouse, 87, Bishopsgate Street Without—same side as Eastern Counties Railway.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

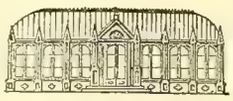
Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

HORTICULTURE IN ALL ITS BRANCHES.

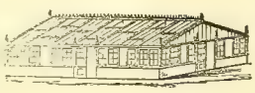
J. WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

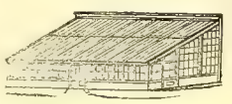
The Nobility and Gentry about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.



The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

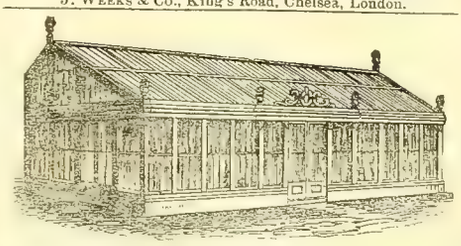


The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.



Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.



HOTHOUSES, CONSERVATORIES, &c., made and fixed complete, at a considerable reduction. CUCUMBER and MELON BOXES and LIGHTS of all sizes, made of the best materials, glazed and painted complete, kept ready for immediate use, packed and sent to all parts of the kingdom. Reference may be had to the nobility, gentry, and the trade in most of the counties in England.—JAMES WATTS, Hothouse Builder, Claremont Place, Old Kent Road, London.

METAL CONSERVATORIES, PLAIN OR ORNAMENTAL, ERECTED TO ANY DESIGN.

THOS. WALLER AND CO. (many years Foreman to Messrs. Deane, Dray, & Deane, Finsbury Iron Works, and London Bridge), Iron Founders. House and Ship Smiths, Gas Fitters, and Manufacturers of all kinds of Metal Conservatories, Greenhouses, Verandahs, Balconies, Summer-houses; Hot, Cold, Shower, and Fumigating Baths; Public and Private Buildings. Greenhouse Conservatories heated by hot water or the Patent Drying Apparatus. Every description of open and close Kitchen Ranges for large or small establishments. The Trade supplied with Metal and Iron Sash Bars for Conservatories and Greenhouses, bent to these or any other design on the shortest notice. Experienced workmen sent to any part of the kingdom.

Office, 47, Fish Street Hill, London.

Ratcliff Iron Works, 12 and 13, Rose Road, Ratcliff, near Stepney Railway Station.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1s. 3d. per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8d. per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

EDWARD AND A. WEEKS (late with J. WEEKS & Co.), Park Cottage, King's Road, Chelsea, are now in a position to execute any of the above works, in the very best manner, and at a reduced price. Materials and workmanship warranted best quality. Plans and estimates forwarded on application for all kinds of Horticultural Erections, also for the Heating of Churches, Hospitals, Halls, Offices, &c.

One, two, and three-light Boxes always on hand.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

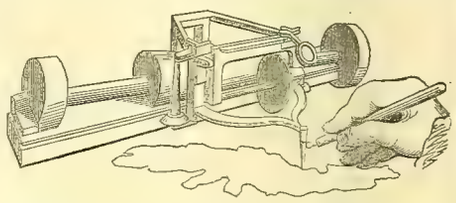
THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

GUTTA PERCHA BOOTS FOR SHEEP, for the Cure and Prevention of FOOT-ROT (price 4d., 5d., and 6d. each). Price of the Powder, in tin cases, sufficient for 100 sheep, 2s. 6d.—Address JOHN JONES and Co., Patent Works, Sheffield. London Agent, Mr. F. HAINES, 22, Lime Street, City.

TO SURVEYORS, ARCHITECTS, & ENGINEERS.



SANG'S PLATOMETERS; OR, SELF-ACTING CALCULATORS.—These Instruments tell accurately the contents of figures drawn on Maps. They effect a great saving of time and labour, as in order to find the area it is only necessary to lead a tracer round the outline of the figure, however irregular it may be. Price 10*l.* each. Sold by JOHN SANG, Kirkaldy.

WIRE FENCING, 6¾d. per square yard, in various widths, from 6 feet to 15 inches, an effectual fence against hares, rabbits, cats, dogs, sheep, deer, fowls, pheasants, &c. Wire Hurdles 3s. each (5 ft. 6 in. by 2 ft. 3 in). This Wire-work is worked in oil, and does not rust very quick, and is the cheapest article of the kind in the market.—R. RICHARDSON, 21, Tonbridge Place, New Road, near King's Cross, London.

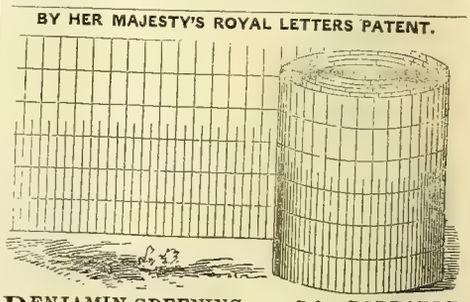
GALVANISED WIRE GAME NETTING.—7d. PER YARD, 2 FEET WIDE.

	Galvanised.	Japanned iron.
2-inch mesh, light, 24 inches wide ...	7d. per yd.	5d. per yd.
2-inch „ strong „ ...	9 „	6½ „
2-inch „ extra strong „ ...	12 „	9 „
1⅝-inch „ light „ ...	8 „	6 „
1⅝-inch „ strong „ ...	10 „	8 „
1⅝-inch „ extra strong „ ...	14 „	11 „

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised Sparrow-proof Netting for Pheasantries, 3d. per square foot. Patterns forwarded post free.

Manufactured by BARNARD & BISHOP, Market Place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

BY HER MAJESTY'S ROYAL LETTERS PATENT.



BENJAMIN GREENING AND Co.'s. PORTABLE WIRE FENCES, Manufactured by Patent Machinery.

The new method of manufacturing Wire Fencing (which B. G. & Co. have invented and patented) makes it at once the cheapest, strongest, and most durable fence ever offered to the public. It is elegant in pattern and light in appearance, being also an entire fence in itself; it is much superior to the common Wire Netting Fence now in use. It can be fixed or removed by any labourer. It requires fewer supports than any other, and is infinitely cheaper than hand-made Fences.

PORTABLE HORSE and CATTLE FENCE.—PORTABLE SHEEP and LAMB FENCE.—POULTRY-PROOF FENCING.—PORTABLE HARE and RABBIT-PROOF FENCING.

Trainers for Peas, Garden Bordering, Aviaries for Poultry, Pheasant Breeding Cages, Ornamental Varieties, Light and Cheap Kinds, Twisted Wire Strand Fence for the Colonies, &c.

For Prospectuses, Engraved Sheet of Patterns, and any other information, apply to Messrs. B. GREENING & Co., 1 and 3, Church Gates, and 2 and 2a, Cateaton Street, Manchester.

PRIZE MEDAL—1851.
AT A VERY ECONOMICAL RATE.

SAMUEL CUNDY, Mason and Builder, Pimlico Marble and Stone Works, Belgrave Wharf, Lower Belgrave Place, Pimlico, London.

Marble Chimney-pieces manufactured by improved machinery. The public are invited to view the stock, unequalled for quality and price. A good Marble Chimney-piece for 40s. Marble Work in all its branches at a remarkably cheap rate for Halls, Dairies, Larders, &c. Circulars sent on application.

N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application.

MAW'S ENCAUSTIC TILE PAVEMENTS.

MAW & CO. send for six stamps their NEW BOOK OF DESIGNS (with prices), adapting this most durable, economical, and decorative production of Mediæval Art to Entrance Halls, Passages, Conservatories, Verandahs, and every description of modern and ancient Building. Specimens at 11, Aldersgate Street, City.

Benthall Works, near Broseley, Shropshire.

HORTICULTURAL BUILDINGS, ROCK and RUSTIC WORK, ORNAMENTAL WATER, FOUNTAINS and FALLS, and LANDSCAPE GARDENING, executed on the best principles; Estates Improved, Land Laid Out for Building, &c., by Mr. Glenny, Valuer, Estate and Horticultural Agent, 420, Strand.

"FRIGI DOMO."—Patronised by Professor Lindley for the Royal Horticultural Society, the Royal Zoological Society, by his Grace the Duke of Northumberland at Syon House, and many cultivators of first class Horticultural and Floricultural produce.

"FRIGI DOMO," a Canvas made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1s. 6d. per yard run, of E. T. Archer, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey.

GARDEN NETS, FISHING NETS, SHEEP NETS, and RABBIT NETS, made by machinery, and supplied on very low terms. Samples sent free.—R. Richardson, 21, Tonbridge Place, New Road, near King's Cross, London.

SUBSTITUTE FOR GARDEN MATS.—Waxed Sheeting nearly 2 yards wide, 1s. per yard run—admits light and excludes cold; Thick Canvas Tarpauling, 1s. per square yard; Thick Canvas Waxed Sheeting, 1s. per square yard, may be had various widths: these Canvases are excellent for Roofing Sheds and Outhouses, as they are quite Waterproof.—R. Richardson, 21, Tonbridge Place, Judd Street, New Road, London.

EMIGRANTS' IRON and WOOD HOUSES from 10l. each; Drawings of 21 Houses sent free. Also maker of Iron and Wood Summer Houses for Gardens. Portable Poultry Houses, Pheasantries, &c.—R. Richardson, 21, Tonbridge Place, New Road, near King's Cross, London.

WATERPROOF CAPES, TARPAULINGS, &c.—Waterproof Capes to effectually protect a man from wet while stooping down, 3s. each; London Policemen's Capes, fresh dressed, 18s. and 24s. per dozen; Tarpauling Coats, 7s. 6d. each; Horses' Waterproof Loin Cloths, 7s.; Driving Aprons, 7s. 6d.; Tarpaulings, 2s. per square yard, any size made up; India Rubber Coats, 20s. each; all kinds of Horse Blankets, Rollers, Tilting, Nose Bags, &c., &c.—R. Richardson, 21, Tonbridge Place, Judd Street, New Road, London.

BERDOE'S WINTER OVER-COATS and CAPES.—One of the Largest Stocks in London of Superior Garments, at reduced charges; also of ditto for YOUTHS. All thoroughly waterproof. At W. Berdoe's, 96, New Bond Street, and 69, Cornhill. (*Nowhere else.*)

PROTOXIDE ANTI-CORROSION PAINT, at a very considerable reduction of price. This article is extensively used by the principal Railway and Gas Companies, and by Builders and others for painting Stucco. It prevents iron from rusting, wood from decay, masonry from damp, and the hottest sun has no effect upon it.—Manufactured by Charles Francis and Sons, Cement Works, Nine Elms, London.

STEPHENSON and PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

FIRE ANNIHILATOR, OR VAPOUR FIRE ENGINE.—Its practical value proved incontestably by 23 remarkable cases of successful use. See "Bradshaw" of this month, p. 132. Engines for Dwelling-houses, 3l. to 4l.—Office of the Fire Annihilator Company, 105, Leadenhall Street, London.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

BAILY'S ROUP and CONDITION PILLS for POULTRY.—This remedy has been extensively tried with uniform success, and is offered to amateurs and the public with the greatest confidence. It will effectually overcome that disease which has hitherto been the bane of the poultry-yard, and destroy that apprehension known to all poultry keepers, when a favourite and valuable fowl is seen to droop. It is inestimable for poultry returning from exhibitions, and greatly facilitates moulting.—Sold, with full instructions for use, in boxes containing 50 pills, by John Baily, 113, Mount Street, Grosvenor Square, price 3s. per box, or by post 3s. 4d. "Fowls by Baily," the most useful and plainest treatise of the day; price 2s., by post 2s. 6d.

Baily's Registered Fountains, universally adopted and approved. Drawings and particulars, by post, on application.—113, Mount Street, Grosvenor Square.

PAUL GAGE'S ELIXIR.—This family medicine has been established 44 years as a most valuable remedy for

PHLEGM,

and all the disorders arising from it, viz., bilious complaints, catarrh, asthma, convulsive coughing, indigestion, colics, cholera morbus, ague fevers, gout, worms, hooping cough, females' complaints, &c. It is demonstrated in a pamphlet on Phlegm, delivered gratis at all the depots, why Paul Gage's Elixir has not failed in desperate cases, where other means have been found of no avail. Sold in bottles at 2s. 9d., 4s. 6d., and 11s., by Paul Gage, 462, New Oxford Street; and by all respectable medicine vendors.

EDUCATION FOR YOUNG LADIES,
At Cheshunt, Herts, adjoining the Nurseries.

MISS PAUL, who has had several years' experience in Tuition, begs to announce that she has vacancies for a few Pupils as Boarders. Terms moderate. Prospectuses will be forwarded by post on application.

LAMPS, OIL, CANDLES, SOAP, ETC.

AT THE WHOLESALE PRICE FOR CASH, at the ALBANY LAMP and CANDLE MANUFACTORY, 55, ALBANY STREET, REGENT'S PARK.

Country orders amounting to £10 or upwards carriage free. Price lists sent on application.

PIGGOTT'S GALVANIC BELT, without any fluid, for the Cure of Disease. See the Treatise, sent free, for one stamp.—Mr. W. P. Piggott, Medical Galvanist, 523c, Oxford Street, London.

KNOW THYSELF!—Professor Blenkinsop continues to receive from individuals of every rank the most flattering testimonials of his success in describing the CHARACTERS of Persons from their HANDWRITING, pointing out their mental and moral qualities, whether good or bad.—Address by letter, stating age, sex, and profession, inclosing 13 uncut postage stamps, to Dr. Blenkinsop, 344, Strand, London.

DO YOU SUFFER TOOTHACHE?—If so, instant ease and a lasting cure will be effected by using Dr. Barker's ENAMEL, the only efficient preparation ever discovered for filling decayed Teeth, preventing Toothache, and stopping the progress of decay, rendering them sound and useful for mastication and ornament. Price 1s., sent post free, with instructions, &c., on receipt of 13 penny stamps, by Dr. Barker, 25, Argyle Square, London.—"My Teeth now look sound and good. Your Enamel has quite cured the Toothache." Miss Ray, Bath.—"I would have given a guinea for your Enamel 12 months ago." Rev. E. Smith.—"I have not had a moment's pain since I filled my Teeth; I can now eat my food freely." Mr. Roberts, Bedford.—"The decay is quite arrested, and my Teeth look as sound as ever they did." Major Banks, Windsor.

DO YOU WANT LUXURIANT HAIR WHISKERS, &c.? If so, use Miss Graham's NIOUKRENE, the most efficacious Hair generant ever introduced. It reproduces the Hair when lost either by disease or decay, prevents its falling off, effectually checks greyness, strengthens weak hair, and is guaranteed to produce those attractive ornaments, Whiskers, Moustachios, Eyebrows, &c., in three or four weeks. For nourishing and beautifying the hair, and sustaining its curling powers in all weathers, it has no equal. Price 3s., and sent post free to any part of the kingdom on receipt of 51 penny postage stamps, by Ellen Graham, 14, Hand Court, Holborn, London.—"My hair is quite restored." Miss Orme.—"I have a full pair of whiskers, thanks to your Nioukrene." H. Robb, Esq.

CLOSE OF HOLIDAYS.—The return of Youth to their respective Boarding Schools induces a solicitude from Parents and Guardians for their Personal Comfort and Attraction, and ROWLANDS' MACASSAR OIL, for accelerating the growth and improving and beautifying the hair, ROWLANDS' KALYDOR, for improving the skin and complexion, and removing cutaneous eruptions, and ROWLANDS' ODONTO, or Pearl Dentifrice, for rendering the teeth beautifully white, and preserving the gums, are considered indispensable accompaniments for the attainment of those Personal Advantages so universally sought for and admired. Beware of Spurious Imitations. The only Genuine of each bears the name of "Rowlands" preceding that of the article on the wrapper or label.—Sold by A. Rowland and Sons, 20, Hatton Garden, London, and by Chemists and Perfumers.

HOLLOWAY'S OINTMENT AND PILLS
CERTAIN REMEDIES FOR OLD SORES AND ULCERS.—Copy of a letter from Mr. John Johnson, of Tregaron, Wales, dated Dec. 19, 1853:—To Professor Holloway. Sir,—For 12 years I was afflicted with sores on my legs and arms, which gradually broke out into ulcerous wounds, and disabled me from following any of the active duties of life. I tried a variety of medicines, and applied several liniments without benefit; but a friend recommended me to use your Ointment and Pills, which completely healed the wounds, and restored me to health, after every other means had failed.—Sold by all Druggists, and at Professor Holloway's Establishment, 244, Strand, London.

THE EAST INDIAN ANTI-NERVOUS PILLS, a cure when all other means fail for Nervous Debility, Lowness of Spirits, Loss of Memory, Head-ache, Dimness of Sight, Fear, Blushings, Tremblings, Melancholy Thoughts, Rheumatic Pains in any part of the body, Urinal Diseases, Constitutional Wasting, &c.

Mr. Roberts, late Army Surgeon, discovered these Pills during his residence in India, testing their curative powers for years. In his own private practice, in numbers of hopeless cases, never failing to produce ease of body and tranquillity of mind in one or two days, and ultimately effecting a permanent cure.

Price, 1s. 1½d., 2s. 9d., 4s. 6d., 11s., and 33s. per box. Sent post free to any part upon receipt of postage stamps or Post-office order for the amount. Address J. Roberts, Surgeon, Hall Square, Yarmouth, Norfolk. Advice and Medicine in every form of disease sent to any part.

Pains in the Back, Gravel, Lumbago, Rheumatism, Gout, Indigestion, Flatulency, Nervousness, Debility, &c.

DR. DE ROOS' COMPOUND RENAL PILLS, as their name Renal (or the Kidneys) indicates, are a most safe and efficacious remedy for the above dangerous complaints. For depression of spirits, incapacity for society, study, or business, giddiness, drowsiness, nervousness, and insanity itself, when arising from or combined with urinary diseases, they are unequalled. Price 1s. 1½d., 2s. 9d., 4s. 6d., 11s., and 33s. per Box, through all Medicine Vendors, or sent (free) on receipt of the amount in postage stamps, by Dr. De Roos, 35, Ely Place, Holborn, London. At Home for consultation daily from 11 till 1, and 5 till 8, Sunday excepted. Advice and Medicines, 1l.

Price 5s. 6d. cloth,

Also, by the same Author, price 2s. 6d.; by post, 3s. 6d.,

A MEDICAL TREATISE ON NERVOUS DEBILITY AND CONSTITUTIONAL WEAKNESS, with Practical Observations, illustrated with Anatomical Plates, Health and Disease.

This work, emanating from a qualified Member of the medical profession, the result of many years' practical experience, is addressed to the numerous classes of persons who suffer from the various disorders acquired in early life. In its pages will be found the causes which lead to their occurrence, the symptoms which indicate their presence, and the means to be adopted for their removal.

GREAT WESTERN, GREAT NORTHERN, SOUTH-WESTERN, AND SOUTH-EASTERN

SEED ESTABLISHMENT, READING, BERKS,

FOR

SUPPLYING SUTTON'S HOME-GROWN SEEDS TO ALL PARTS OF THE UNITED KINGDOM.

THE GARDEN AND FARM SEEDS grown in Berkshire and the adjoining Counties having obtained great celebrity and gained us a very extensive connection in almost every county in the United Kingdom, we have made such arrangements with Messrs. Pickford & Co., who have Offices on most of the great lines of Railways, as will enable us (with a few exceptions), to deliver our Goods CARRIAGE FREE TO ALL PARTS OF THE UNITED KINGDOM.

Our General Catalogue of Seeds is now ready, with prices affixed to every article, and may be had post free in return for one penny stamp; but those who are not acquainted with the best sorts of Garden Seeds, and the proportions of each suitable for a Garden, are confidently recommended to order one of the undermentioned COMPLETE COLLECTIONS FOR ONE YEAR'S SUPPLY, *with descriptions and instructions :—*

SUTTON'S COLLECTIONS OF GARDEN SEEDS.

No. 1.—A COMPLETE COLLECTION OF GARDEN SEEDS, FOR ONE YEAR'S SUPPLY OF A LARGE GARDEN	£3	0 0
No. 2.—A COMPLETE COLLECTION, QUANTITIES REDUCED (SIMILAR SORTS)	2	0 0
No. 3.—A COMPLETE COLLECTION, EQUALLY CHOICE SORTS	1	5 0
No. 4.—A VERY CHOICE ASSORTMENT	0	15 0

If some kinds of Seeds are already possessed, purchasers are requested to name them, that increased quantities of others may be sent in lieu of them.—A List of the sorts and quantities in these Collections may be had in return for one penny stamp. The contents of the No. 1 *Collection is given at full in the third page of the* GARDENERS' CHRONICLE *of December* 31.

SUTTON'S COLLECTIONS OF FLOWER SEEDS.

These may be had in Collections of "*Hardy sorts only*," or assorted in "Hardy," "Half-hardy," and "Tender," as preferred.

No. 5.—THE MOST SHOWY 50 SORTS KNOWN (Post Free)	£0	10 6
No. 6.—THE MOST SHOWY 36 DO. DO.	7	6
No. 7.—THE MOST SHOWY 24 DO. DO.	0	5 0

N.B. Purchasers are at liberty to name any sorts of Flower Seeds they wish included in the above Collections; or the selections may be left to us, in which case the most showy kinds only will be sent.—The superior quality of our Seeds is plainly testified by the numerous orders we are daily receiving from parties who have had them in previous seasons. The following are a few Extracts from Letters now before us, which may be seen at our Counting-house, and hundreds of others similar :—

From Lord Cuninghame, Edinburgh, Jan. 26, 1853.
The Seeds sent by Messrs. SUTTON to Lord Cuninghame were most successful.

From Peter Murdoch, Esq., Glasgow, Jan. 31, 1853.
The quality of all seeds you have yet sent us has been first-rate; and we are much obliged to you for introducing here several new varieties of edibles, amongst others, the universal favourite, "Couve Tronchuda Cabbage."

From the Rev. C. J. Hume, Meonstoke, Jan. 12, 1853.
My friend complains that he cannot get satisfactory seeds. I have referred him to you for an end of all his disappointments in that way.

From Mr. Alex. Gray, Hartwood Gardens, N.B., Feb. 9, 1853.
The seeds sent last season were very fine. The Onions are beyond all praise.

From Mr. Thomas Rowe, Gardener to Mr. Nicholl, Edge Grove, Feb. 10, 1853.
I am glad you sent me a large packet of your Goliah Peas. It was the best cropper I had last season.

From Mr. W. Reid, Gardener to J. Hunt, Esq., Sydenham Hill, Kent, Oct. 24, 1853.
The flower seeds I had from you last spring gave entire satisfaction. I never had finer Stocks and Asters — they were splendid.

From Mr. John Capers, Gardener to Captain Cunynghame, Wellsbourne, Oct. 1, 1853.
I never knew a lot of seeds so good and so true to what they are represented to be.

From the Rev. J. Beauchamp, Crowell Rectory, Tetsworth, July 16, 1853.
I never saw two finer sorts of Lettuce grown than your White and Green Cos; also your Goliah Pea is first rate.

From Jas. N. Constable, Esq., Balmyh, by Blairgowrie, Feb. 15, 1853.
I particularly wish you to send me SUTTON'S Solid White Celery, which is the best I have ever had, and SUTTON'S Superb Pink, which is also excellent.

The advantages of purchasing "SUTTON'S COLLECTIONS OF SEEDS" *are threefold*, viz., superiority *of sorts*, superior *germinating* quality, and great *economy in the cost*; besides the benefit generally derived by procuring Seeds from a distance, being in fact *a change of soil.*

SUTTON'S PERMANENT GRASS SEEDS.

Gentlemen intending to lay down Land to Permanent Pasture, or for one or two years lay, are recommended to communicate with us, stating the nature of the soil and situation, that we may advise as to sorts of Grass Seeds most suitable.

OLD MEADOWS DEFICIENT OF THE MOST NUTRITIVE GRASSES AND CLOVERS may be greatly improved by sowing at this season "SUTTON'S Renovating Mixture" of Seeds, at the rate of 8 to 12 lbs. per acre, price 1*s.* per lb. Our finest LAWN GRASS SEEDS *are highly useful to improve Garden Lawns.*

Post-office Orders should be made payable to JOHN SUTTON & SONS; but WE DO NOT REQUIRE PRE-PAYMENT FOR GOODS, as we have connections in almost every county in the United Kingdom therefore a reference will be sufficient.

N.B.—We are extensive Growers of Mangold Wurzel, Turnip, and other Agricultural Seeds, of which a separate Catalogue is published.

JOHN SUTTON AND SONS, SEED GROWERS, READING, BERKS.

SEEDS.

COCHRANE, 128, High Street, Cheltenham.

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—At a General Meeting of the Members of this Society, held on Wednesday, the 18th inst., for the purpose of electing Two Pensioners on the Funds, the following was the result of the ballot:—

No.	Candidates.		Votes.
1.	Edward Marshall,	13th application, aged 73	—643
2.	John Appleby,	9th " "	61—214
3.	Cornelius Robinson,	7th " "	76—198
4.	Henry Schneider,	6th " "	88—210
5.	William Carter,	6th " "	73— 22
6.	John Blacke,	3rd " "	79— 25
7.	Sarah Lawrence,	3rd " "	65—349
8.	Robert Oliver,	3rd " "	71—215
9.	William Thacker,	3rd " "	66— 21
10.	Charles Charlton,	2nd " "	68— 85
11.	Elizabeth Curtis,	2nd " "	69—196
12.	Elizabeth Heath,	2nd " "	71—685
13.	Joseph Jeffrey,	2nd " "	61— 23
14.	John Kent,	2nd " "	71— 29
15.	George Kidd,	2nd " "	68— 66
16.	John Lawson,	1st " "	75— 13
17.	James Smith,	1st " "	68— 14

The meeting declared Elizabeth Heath and Edward Marshall, as having the greatest number of votes, duly elected pensioners of this charity. By order,
20th January. E. R. CUTLER, Sec., 97, Farringdon Street.

SEEDS—CARRIAGE FREE.

WILLIAM E. RENDLE AND CO. *have, from the very extensive patronage they have received, been induced this season to offer the following liberal arrangement to all who purchase Seeds from their establishment.*

ALL ORDERS ABOVE £5 WILL BE DELIVERED CARRIAGE FREE TO ANY RAILWAY STATION IN ENGLAND OR WALES, AND TO ANY STEAM PORT IN ENGLAND, WALES, IRELAND, OR SCOTLAND.

Two or three purchasers joining together will therefore have the advantage of having their orders delivered free of any cost for carriage.

RENDLE'S PRICE CURRENT FOR 1854 should be obtained by all who have gardens, or who take an interest in the cultivation of the soil.

SEEDS FOR IRELAND, SCOTLAND, & WALES.

SUTTON AND SONS having many customers in North and South Wales, Scotland and Ireland, whom they have supplied with Agricultural and Horticultural Seeds for many years, are well acquainted with the sorts which thrive best in each locality.

SUTTON & SONS *deliver their Goods Free of Carriage to the Seaports, and many other parts of Ireland, Scotland, and Wales. For particulars, address*

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

THE EARLIEST PEA IS "FAIRHEAD'S EARLY CONQUEROR." To be had of CLARKE AND CO., Borough, London; 2s. per quart (price per bushel on application).

YORK NURSERIES.

JAMES BACKHOUSE AND SON respectfully inform their Friends, that notwithstanding the scarcity of many kinds of Horticultural Seeds this season, their own crops have been safely harvested, and with very few exceptions are quite equal in quality to those of last season. *Being themselves Growers*, they are able to a large extent to insure the genuineness of the articles they supply.—January 21.

PELARGONIUMS.

JOHN DOBSON begs to announce that he is now sending out, in good strong plants, with four or five strong breaks to them, the new PELARGONIUMS raised by E. Beck, Esq., which will be found to possess every good quality. A Catalogue, with full description of the above, with every other good variety, may be had in exchange for one stamp.

J. D.'s Seed Catalogue is now ready, and will be found to contain the best varieties at the lowest possible prices. May be had in exchange for one postage stamp. A General Catalogue is nearly ready, which will contain every novelty in Fancy Geraniums, Pansies, Cinerarias, Antirrhinums, &c., and will be forwarded on receipt of one postage stamp. Any twelve of the following Geraniums for 42s., hamper, &c., included in the price: Optimum, Magnet, Commander, Rosa, Gertrude, Harriet, Purpurea, Virgin Queen, Magnificent, Rachel, Galatea, Basilisk, First of May, Plantagenet, Eleanor, Vulcan, Zaria, Exhibition.
Woodlands Nursery, Isleworth.

TO FARMERS.

IN ACCORDANCE with the wishes of Farmers, Millers, and others interested in the Corn Trade, an Edition of the AGRICULTURAL GAZETTE AND GARDENERS' CHRONICLE will be published every Monday Afternoon, in time for post. The Monday's Edition will, in addition to the usual markets, contain a full report of the Mark Lane, Smithfield, and Newgate Markets of the day.—May be ordered of any Newsagent. Price 6d.

SUPERB DOUBLE HOLLYHOCKS.

WILLIAM CHATER has now ready a fine healthy stock of young plants of all the leading sorts. For price and description see General List, which also contains hints on their culture, with observations on the exhibition of Hollyhocks, &c. &c., and may be had by inclosing a postage stamp.
Saffron Walden Nursery, January 21.

J. G. WAITE begs to return thanks to his friends and purchasers of the DANIEL O'ROURKE PEAS, and to inform them and the public generally, that on account of the extraordinary demand for this valuable Pea, he will not be able to supply any more this season.

J. G. W. will be ready to supply seed of this year's crop in the months of July and August.—181, High Holborn, London.

BRITISH QUEEN POTATO.—As early as a Shaw, the quality of a Regent, and one of the most productive kinds grown, recommended with perfect confidence; price per bushel, 10s.; per peck, 3s., bag included, for pre-payment only.
HART AND NICKLIN, Guildford, Surrey.

DOUBLE ITALIAN TUBEROSES.

DAWE, COTTRELL, AND BENHAM (successors to FREDERICK WARNER), have just received their Annual Importation of the above, in excellent condition, which they offer at 3s. 6d. per dozen, with the usual allowance to the trade. Their wholesale Lists of Garden, Agricultural, and Flower Seeds are ready, and may be obtained on application.
3, Lawrence Pountney Lane; and 36, Moorgate Street, London.
Established 28, Cornhill. 1720.

A BEAUTIFUL ORNAMENT FOR THE DRAWING-ROOM.

THE DOUBLE LILY OF THE VALLEY is universally admired, on account of its delicious Fragrance, Elegant Flowers, and Graceful Habit; as a pot plant it is superior to any flower in cultivation, its hardy nature also renders it a suitable ornament for the open garden. One dozen Roots, with directions for their culture, sent free by post on receipt of 36 postage stamps.—JOHN J. REID, Monkton Nursery, Ryde, Isle of Wight.

THE FINEST BALSAMS IN EUROPE, in Six Classes; Seed saved by Mr. GLENNY from flowers three inches across: the six 37 stamps, Mixed Seeds, 13 stamps, in Sealed Packets only, signed and sealed. The finest seeds that can be had procured to order, and all other choice Horticultural subjects.—420, Strand.

SUPERB FLOWER SEEDS.—The following select Seeds, saved from the best varieties, sent post free at 1s. per paper:—Antirrhinum, Petunia, Verbena, Double Balsam, and Pansy.—From WILLIAM KNIGHT, Florist, 53, High Street, Battle, Sussex. Select lists of Seeds sent on application.

"NORFOLK HERO" CUCUMBER. — Without exception the very best Cucumber for open ground cultivation that has yet been offered. It is a most prolific bearer, as handsome as any frame variety, and is delicate in point of texture, the fruit measuring from 16 to 20 inches in length. It is in the sole possession of YOUELL and Co., who will forward per post free (on receipt of postage stamps) packets containing six Seeds, 1s.; 18 seeds, 2s. 6d.—"To Market Gardeners the above will be found a great acquisition."
Royal Nursery, Great Yarmouth.

CHOICE FLOWER SEEDS,

ANEMONE, from the most showy and brilliant kinds,		1s.	"

FASTOLFF RASPBERRY SEED, for exportation, p. oz., 3s. 6d.
The above, per post, free.—Postage Stamps received in payment.
YOUELL AND CO., Royal Nursery, Great Yarmouth.

CHOICE FRUIT TREES.

JOHN ADAMS, NURSERYMAN AND SEEDSMAN, Brompton Park, Kensington Gore, London, begs to call the attention of the trade, and planters generally, to his extensive Stock of FRUIT TREES, embracing all the best varieties in cultivation, under their correct nomenclature; but more particularly to his Standard Trained Cherries, Plums, Pears, Apricots, Peaches, and Nectarines; Dwarf Trained Cherries, Pears, Plums, Peaches, and Apples; Standard Cherries, Plums, Pears, and fine large Mulberries; Dwarf Pears, Plums, Apples, and Nectarines, of which he has a large stock, all of first-rate quality.

TO FOREST PLANTERS.—The Subscribers beg to offer about 50,000 very fine English OAKS, 5 feet high, of great substance, and twice transplanted. They will be sold cheap. Price on application.—W. JACKSON & Co., Bedale, Yorkshire.

LIME TREES, 12 to 14 feet, 42s. per 100.—SPRUCE FIRS, 2 to 3 feet, 6s. per 100.—LAURUSTINUS, very fine, 30s. per 100.—Apply to BENJAMIN R. CANT, St. John's Street Nursery, Colchester.

FRUIT TREES, &c.—The following are very strong, and finely grown:—Dwarf-trained Moor Park Apricots, and other sorts, 42s. per doz.; Standard trained Peaches and Nectarines, 60s. to 80s. per dozen; Dwarf trained Green-gage Plums, 30s. per dozen; Prince Albert Rhubarb, strong to force, 6s. per dozen.
Berberis aquifolium and Berberis dulcis.—These beautiful shrubs are 1 to 2 feet high; 8s. per 100, 60s. per 1000.—Usual discount to the Trade.—JOHN JEYES Nurseryman, Northampton.

WHEELER'S SHORT SELECT SEED LIST.

J. C. WHEELER AND SON'S SEED LIST *is now ready, and will be forwarded free on application. We have tried to make it as short and as select as possible, leaving out the names of all inferior varieties, so that it is really a List of the best Seeds in cultivation. Grasses and other Agricultural Seeds, Garden and Flower Seeds, all described, and prices put to every article. We deliver our Seeds Carriage Free to almost every Railway Station in the kingdom, and take especial care that every sort we send out is true to name, and of the best quality.*

J. C. WHEELER & SONS, Seed Merchants, Gloucester.

RENDLE'S NEW PRICE CURRENT FOR 1854 *should be obtained by all who have gardens, whether small or large. It will be found to be a correct and useful Guide to the amateur and young gardener; a remembrance to the more advanced in horticulture, and a source of reference to all.*

Can be obtained from the London Publishing Office,
294, STRAND;
or from the Proprietors,
WILLIAM E. RENDLE & Co.,
Seed Merchants,
ESTABLISHED 1786. Plymouth.

KITCHEN GARDEN SEEDS	AGRICULTURAL SEEDS
FLOWER SEEDS	SEED POTATOES

AND BEDDING PLANTS.
Address JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

NURSERIES, SLEAFORD.

JOHN AND CHARLES SHARPE, SEED GROWERS and NURSERYMEN, beg to state that their Wholesale Priced List of Seeds and Nursery Stock is now ready, and may be had on application.

THOMAS SIBBALD, NURSERYMAN and SEEDSMAN, Bishop Auckland, will forward on application his DESCRIPTIVE CATALOGUE OF GARDEN AND FLOWER SEEDS. The stock is selected with care, and may be depended on as being genuine, and of equal quality with any offered.

DAWE, COTTRELL, AND BENHAM'S ANNUAL DESCRIPTIVE LIST OF FLOWER AND GARDEN SEEDS, &c., containing all the New and Choice Varieties of the Season, is Published, and will be forwarded post free to any address.—36, Moorgate Street, and 3, Laurence Pountney Lane, London. (Successors to F. Warner, established 28, Cornhill, 1720.)

STANDISH AND NOBLE'S CATALOGUE for the present season is Now Ready, and may be had on application. A selection from it appeared as a detailed advertisement in the *Gardeners' Chronicle*, of Saturday, Sept. 10th, to which they respectfully refer plant buyers. It contains many new and choice plants.—The Nursery, Bagshot, Surrey, Jan. 21.

CHARLES DIMMICK begs to announce to his friends and the public, that his CATALOGUE of GARDEN SEEDS is now ready, and may be had on application. They have been selected with great care from the best stocks in the country, and the growing qualities tried as soon as received.
Horticultural Establishment, 112 and 113, High Street, Ryde, Isle of Wight.—January 21.

DAHLIAS.

JOHN KEYNES, FLORIST, Salisbury, respectfully begs to announce that his Annual CATALOGUE of all the NEW and FIRST-RATE DAHLIAS for 1854 is now ready, and will be forwarded on application.

The two new and beautiful Dahlias, "FANNY KEYNES" and "RACHEL RAWLINS" will be figured in the February Number of "THE FLORIST;" and as drawings of these beautiful Dahlias cannot be procured through any other medium than "THE FLORIST," J. K. recommends his friends to order the February Number without delay.
Castle Street Nursery, Salisbury, Jan. 21.

AMERICAN PLANTS.

JOHN WATERER begs to announce that his NEW CATALOGUE of RHODODENDRONS, AZALEAS, CONIFEROUS PLANTS, &c., is now published, and may be had by enclosing two stamps for postage.

The colours of all the Rhododendrons worthy of cultivation are described in order to facilitate purchasers in making selections, together with a Treatise on their successful management.

☞ The Rhododendrons forming the American Exhibitions in the Royal Botanic Society's Garden, Regent's Park, London, are annually supplied from this establishment.

The American Nursery, Bagshot, Surrey, near the Farnborough Station, South-Western Railway, and 3 miles from Blackwater, South-Eastern Railway.

GEORGE BAKER begs to say that his DESCRIPTIVE CATALOGUE of AMERICAN PLANTS, CONIFERS, ORNAMENTAL SHRUBS, FRUIT and FOREST TREES, &c., may be had by enclosing two postage stamps.

G. B. wishes to call particular attention to his fine Stock of GREEN and WEEPING HOLLIES, from 1 to 12 feet high.

G. B. has supplied the American Exhibition in the Royal Botanic Gardens, Regent's Park, from its commencement.

American Nursery, Windlesham, near Bagshot, Surrey, about six miles from Staines Station, Windsor Branch, South-Western Railway, where conveyances may be obtained.

MYATT'S VICTORIA RHUBARB.—For Sale 4000 VICTORIA (true) RHUBARB ROOTS, in lots, to suit purchasers. Price on application.—Address JOHN SCHOFIELD & SON, Seedsmen, &c., Knowsthorpe, near Leeds, Yorkshire.

STANDARD TRAINED, "MORELLO AND MAY DUKE CHERRIES."

YOUELL AND CO. are commissioned to offer for Sale a few very handsome "fan-trained" trees of the above (seven years trained) in full bearing, and will remove with perfect safety. Stems from 4½ to 6 feet in height, and heads measuring from 10 to 16 feet across, price 15s. to 21s. each. Those wishing to furnish their walls without loss of time, will seldom meet with a like opportunity.

Royal Nursery, Great Yarmouth.

EXOTIC NURSERY, CANTERBURY.

WILLIAM MASTERS, at the commencement of a new season, has the pleasure to tender his very grateful thanks to his numerous Patrons for the very kind support with which they have favoured him during the last thirty-five years, and begs to solicit a continuance of the same on behalf of himself and his Son, with whom he has now entered into PARTNERSHIP, and who has been engaged with him in the practice of Landscape Gardening and the various branches of his business for some years.

WILLIAM MASTERS AND SON beg to offer the following Collections of GARDEN SEEDS, in assortments containing a supply for the whole year in proportionate quantities of each.

No. 1 Collection, for a large garden, containing 20 quarts of Peas in 20 best sorts for succession, 10 best sorts of Broccoli, 8 ditto of Lettuce, with all other vegetables in proportion	£2 10 0
No. 2, the best new and other sorts, in smaller quantities	1 10 0
No. 3, ditto ditto	1 0 0
No. 4, a Collection of esteemed kinds for a small garden	0 10 0

Grass Seeds for Lawns, Permanent Pasture, or alternate Culture.

FLOWER SEEDS, with printed Directions for their Culture, in Collections of 12 for 2s. 6d.; 25 for 5s.; 50 for 9s.; 100 for 18s.

Their New Seed Catalogue for 1854 will be forwarded on application.—January 21, 1854.

DISSOLUTION OF PARTNERSHIP.

THE PARTNERSHIP which has existed for thirty-five years between my cousin and myself, as Seed Merchants and Nurserymen in this City, under the firm of "FRANCIS AND JAMES DICKSON," and also in Manchester for upwards of four years, under the firm of "FRANCIS AND JAMES DICKSON AND CO.," has been this day DISSOLVED by mutual consent; and I beg to tender my grateful acknowledgments and sincere thanks to the numerous patrons and friends of the late firm, for the kind and liberal patronage extended to my late partner and myself for so many years, and as I have now entered into Partnership with my Sons, I venture to hope that we may, unitedly, continue to merit a share of that confidence and patronage which I enjoyed for so long a period as senior partner in the late firm.

Our Seed Business will be carried on in the same premises as before, and our Nursery Business at the Upton Nurseries near Chester, under the firm of FRANCIS and ARTHUR DICKSON & SONS.

Chester, Dec. 28, 1853. FRANCIS DICKSON.

SEED WAREHOUSE, 106, EASTGATE STREET.

FRANCIS AND ARTHUR DICKSON AND SONS, in soliciting a continuance of the confidence and patronage enjoyed by the late firm, have only to state that they are determined that every article sent out by them, whether in Seeds or Plants, shall not only be of first quality but shall also be charged the most moderate price; and they further assure their customers and friends that no effort shall be wanting on their part at all times to meet the wishes of those who entrust their orders to them. Their stock of New Seeds for the ensuing season is now complete; catalogues of which will be ready in a few days, and may be had on application.—January 21.

SEED ESTABLISHMENT AT 102, EASTGATE STREET, AND NURSERY GROUNDS AT NEWTON, NEAR CHESTER.

THE FIRM OF F. AND J. DICKSON having been DISSOLVED, I take the liberty of informing my Friends and the Public generally, that I purpose in future carrying on business in conjunction with my Sons, under the Firm of "JAMES DICKSON & SONS," and beg very respectfully to solicit a share of those kind favours hitherto conferred on my late partner and myself, and which will at all times continue to have my utmost care and undivided attention. I avail myself of this opportunity of returning to all the numerous customers and friends of the late Firm throughout the entire principality of North and South Wales, Cheshire, Shropshire, Lancashire, and adjoining counties, my most sincere thanks for the very liberal support and great kindness which for thirty-five years I have had the pleasure and satisfaction of experiencing whilst personally travelling through these districts. Trusting to be favoured with a continuance of the same support and commands, I am yours, very respectfully, JAMES DICKSON.

J. D. & SONS, holding a very heavy Stock of Forest, Fruit, and Ornamental Trees, Evergreen and Flowering Shrubs, and all kinds of Nursery Stock, on Grounds which must be cleared before the end of March next, have determined, rather than incur the additional expense of transferring them to other parts of their Grounds, to Dispose of the Stock thus situated at the lowest possible prices.

Their New Seed Warehouse, which is at 102, Eastgate Street, four doors from the south end of St. Werburgh Street end, towards the Cross, is fully supplied with a newly-selected Stock of all sorts of Garden, Farm, Flower, and other Seeds, of the very best quality, for the ensuing season, orders for which will much oblige.

J. D. & SONS beg to add, that the old-established Seed Business (heretofore carried on by the late firm) at 106, Deansgate, Manchester, has become their property, by which means they will be enabled to supply their friends in that city and neighbourhood with every article in the several branches of their business with every facility and despatch.

J. D. & SONS would further state, that they will retain and continue, on a greatly enlarged scale, the Nursery and Seed Establishment carried on by the late firm at Newtown, Montgomeryshire, from which place also they will have great pleasure and satisfaction in supplying their friends in that locality with such orders as they may favour them with.

SEEDS CARRIAGE FREE.

A large quantity of SPRUCE FIRS, 1½ to 6 feet, on sale.

Victoria Nursery, January 21.

PARADISE PEA.

STEWART AND MEIN having received from all quarters the most favourable reports of the above Pea, beg again to call attention to it, and to intimate that in consequence of the generally defective crop of last season, their stock of it is very limited, and they would therefore advise an early application from intending purchasers. Price and other particulars may be had on application. Agents in London: Messrs. Charlwood & Cummins, Covent Garden; and Messrs. Nutting & Sons, Cheapside; and in Edinburgh, Messrs. Lawson & Son, and Messrs. Dickson & Sons.

S. & M. have also on hand Ash-leaved Kidney, Jackson's Improved Ash-leaved Kidney, Shaw's Early, and Chinese Early Potatoes, at moderate prices.

Paradise Nurseries, Kelso, Roxburghshire, Jan. 21.

JUDSON'S RICHMOND VILLA BLACK HAMBURGH VINE.

ARTHUR HENDERSON AND CO. have the pleasure of informing their patrons and friends that they have good plants of this valuable and much-esteemed Vine at 5s. each; extra strong plants, 7s. each.—N.B. For full particulars of the distinguishing characteristics of this Vine, we beg to refer our customers to the *Gardeners' Chronicle* of October 25th, 1851.

CHOICE FERTILISED PETUNIA SEEDS.

ROBERT DEBRON begs to offer the above, which he can recommend with the greatest confidence as being carefully saved from one of the Finest Collections in the Kingdom. Warranted to produce flowers equal to any out. In packets, sufficient to grow 200 plants, 2s. 6d. per packet; second quality, 1s. per packet. Strong Seedling Plants from the above, established in separate pots in April, 3s. to 6s. per dozen.—May be obtained of Messrs. LEE, Hammersmith Nursery; also of Messrs. NOBLE, COOPER, & BOLTON, 152, Fleet Street, London.

Ely Nursery, Ely, Cambridgeshire.

SHRUBS, FRUIT AND FOREST TREES, SEEDS, &c.:—Sycamore, Chestnut, Walnut trees, 5 feet high, 3d. each; Laurels, 2d. each; Privet, 1d. each, 4 feet high; Red, White, and Black Currants, 3 feet high, 4d. each; Ilex Oak, English Yew, Euonymus, Weigela, Rosea, Gold and Silver leaf Cypress, variegated Holly, Escallonia macrantha, all at 1s. each; Cryptomeria japonica, 3s. to 5s. each; Cedar of Lebanon, 3s. to 5s. each; Rhododendrons, 1s. to 5s. each; Box Edging, 4d. per yard. Every other Shrub, Flower, or Tree, at equally low prices. —At W. CULLINGFORD'S, 1, Edmund Terrace, Ball's Pond Road, Islington, London. Flower and Vegetable Seeds of every kind.

CORN MARKET, WISBEACH, CAMBRIDGESHIRE.

CHARLES SHARPE begs to call the attention of the nobility, gentry, and trade to the undermentioned choice collection of SEED POTATOES, grown with great care upon marsh land near the sea, which is the most appropriate soil for the culture of the Potato, as it is less affected by the disease, and of finer quality. The undermentioned prices include hampers and package. Smaller quantities can be had if required. The Trade Price can be had on application.

Fine Flowering Plants of Aquilegia glandulosa, 2s. each, or 20s. per dozen.—14, Tavistock Row, Covent Garden, London.

GREAT WESTERN, GREAT NORTHERN, SOUTH-WESTERN, AND SOUTH-EASTERN

SEED ESTABLISHMENT, READING, BERKS,

For Supplying SUTTON'S HOME-GROWN SEEDS to all parts of the United Kingdom.

THE GARDEN AND FARM SEEDS grown in Berkshire and the adjoining Counties having obtained great celebrity and gained us a very extensive connection in almost every county in the United Kingdom, we have made such arrangements with Messrs. Pickford & Co., who have Offices on most of the great Lines of Railways, as will enable us (with a few exceptions), to deliver our Goods CARRIAGE FREE TO ALL PARTS OF THE UNITED KINGDOM.

We take every care and spare no expense to grow and supply our customers with good Seeds, true to their kinds; and we have much pleasure in presenting the following description of our Establishment from the "GARDEN MEMORANDA," *in the* GARDENERS' CHRONICLE *of November* 27, 1852 :—

"MESSRS. SUTTON AND SONS', READING, BERKS. — This important Seed Establishment is situated in the Market-place of the fine old town of Reading, which is easily and speedily reached by the Great Western Railway. The shop is fitted up with all the appliances and conveniences for despatch which an extensive business demands. The excellent mode of labelling everything is worthy of especial remark, as the possibility of committing mistakes must be greatly diminished. Behind the shop is an extensive double range of warehouses, which are occupied by Garden and Agricultural Seeds, more especially Turnip and Grass Seeds, of both of which Messrs. Sutton have one of the best collections in the country. Beyond the warehouses is a small garden in two compartments, both furnished with glass houses and pits. Here the vitality of the different kinds of Seeds is tested, and the gayer kinds of plants kept for decorating the shop and for sale in pots. The principal Nursery, however, belonging to this establishment lies on the south side of the town, in a fine level situation. Here, Roses, Fruit Trees, Evergreens, and Conifers are chiefly cultivated, together with, here and there, patches of the most choice vegetables for trial. This firm have given up the saving of Rye, Vetches, and Seed corn, in order that undivided attention may be given to the finer Seeds, such as those of Turnips, Clovers, and Grasses. Of the latter, examples of all that are valuable to the Farmer, or for forming Permanent Pastures, are collected here, and correctly labelled, so that an opportunity is afforded of inspecting their different characters while growing in the same soil and under precisely the same treatment. In the horticultural portion is a piece of land set apart as 'sample ground,' in which we observed rows of Broccolies, Cabbages, Lettuces, &c., all growing side by side, and labelled with their names in full; also beds of choice Beets, Carrots, &c., for transplanting for Seed. Upwards of 30 varieties of Peas had been grown here, but they were cleared off, excepting Sutton's Goliah, which was still producing pods and blossoms; it was sown on the 22d of August. It is therefore a good Pea for a late crop, and it appears to be very productive; its flavour resembles that of Knight's Marrowfat. Many sorts of Potatoes had been cultivated here, but now stored away. Of agricultural crops, a compartment was allotted to Turnips, containing about 40 varieties of Swedish, Hybrid, and other kinds. Of the former, the best appeared to be Sutton's Purple-top and Rivers's Stubble Swede. Among Hybrids, Sutton's, Skirving's, and Rivers's are all especially worthy of mention. Chivas's Orange Jelly was particularly fine, both as regards smoothness and colour. The largest Turnip in the grounds was the New Lincolnshire Red, so called from its being brought originally from that county by Philip Pusey, Esq., who presented the stock to Messrs. Sutton. Of Mangold Wurzel and Beet (which were of great size), we noticed a large red variety, called the Elvetham Long Red, a new sort introduced by Messrs. Sutton; also very finely formed Yellow Globe Mangold Wurzel, besides the large Crimson Beet, and the White Silesia Sugar Beet. There were also Kohl-Rabi, Drumhead, and other Cabbages, White Belgian Carrots, and a very large new Orange-colour variety, which seemed likely to vie with the White Belgian itself for size."

The foregoing notes were written by a Gentleman in connection with the GARDENERS' CHRONICLE AND AGRICULTURAL GAZETTE, *who is in the practice of inspecting the principal Horticultural and Agricultural Establishments in the kingdom, for the purpose of reporting the peculiar features of each, in that valuable Journal. See* GARDENERS' CHRONICLE, *Nov.* 27, 1852.

N.B.—We are extensive Growers of Mangold Wurzel, Turnip, and other Agricultural Seeds, as well as all kinds of Kitchen Garden and Flower Seeds, of which a Catalogue is published annually, and will be sent Post Free on receipt of One Penny Stamp. Estimates given, and special contracts made for Seeds in large quantities. Post-office Orders should be made payable to JOHN SUTTON & SONS; but WE DO NOT REQUIRE PRE-PAYMENT FOR GOODS, as we have connections in almost every county in the United Kingdom, therefore a reference will be sufficient.

JOHN SUTTON AND SONS, Seed Growers, Reading, Berks.

YEWS! YEWS! YEWS!

WILLIAM YOUNG informs Gentlemen, Contractors for Cemeteries, and others, that he has a large stock of fine Fanned YEWS, 6, 8, and 10 feet high, well furnished, and will remove with safety. Likewise a quantity of fine quartered Yews, 7 to 8 feet, of a good colour, all recently removed. Persons requiring a quantity will find the above well worth their inspection.

Melford Nursery, near Godalming, Surrey, two miles from the South-Western and three from the South-Eastern Railways.

THE CUCUMBER SEASON.—Growers of this superb and select branch of Horticulture should endeavour to procure seeds of such varieties as will give them satisfaction, and meet every expectation for exhibition or otherwise. The under-mentioned have been thoroughly proved, and testimonials and orders again received from numerous correspondents.

CAPTIVATION CUCUMBER, a beautiful black spine, free from ribs and shrivels, carries its bloom well, fruit never turning colour at the point like many others, length from 20 to 28 inches uniform from stem to point (a consideration to exhibitors), 2*s.* 6*d.* per packet.

PHENOMENON CUCUMBER.—Also a fine black spine, rapid grower, and the hardiest of all long Cucumbers, in other respects similar to the above, 2*s.* 6*d.* per packet. This will give every satisfaction to growers.

Victory of Bath Cucumber, 1*s.* per packet; Winter Cucumber, Lord Keynon's Favourite, 2*s.* 6*d.* ditto; Gordon White Spine, 1*s.* ditto; Chamberlain's Essex Hero (very fine), 2*s.* ditto; Sunderlandwick Cucumber (very fine), 2*s.* ditto; Hunter's Prolific, 1*s.* ditto; and numerous other good varieties, at 1*s.* per packet.

MELONS, the best sorts, true to name, and such as will give every satisfaction.—Tiley's Incomparable, 1*s.* 6*d.* per packet; Tiley's Bromham Hall, 1*s.*; Tiley's Golden Ball, 1*s.*; Tiley's Queen, 1*s.*; Tiley's Bowood, 1*s.*; Victory of Bath, 1*s.*; Camerton Court, 1*s.*; Beechwood, 1*s.*; Windsor Prize, 1*s.*; Emperor, 1*s.*; Fleming's Hybrid Persian, 1*s.*; Hampton Court, 1*s.*; Blackhall's Green Flesh, 1*s.*; Bailey's, 1*s.*; and numerous others.

*** A Packet of each of the first-named Cucumbers, and two packets of either of the Melons named, sent free for 60 penny stamps.

HOLLYHOCK SEED, saved from a splendid collection of all the newest and best varieties out, 2*s.* 6*d.* per packet.

GERMAN ASTER SEED, from some of the finest flowers ever exhibited, 1*s.* per packet, or a packet of this and of the Hollyhock for 3*s.*

ANTIRRHINUM SEED (SPLENDID), 1*s.* per packet.

A remittance must accompany every order by cash or penny postage stamps, when the whole or any part (as the case may be) will be immediately forwarded.

EDWARD TILEY, NURSERYMAN, SEEDSMAN, & FLORIST,
14, Abbey Churchyard, Bath, Somersetshire.

CEDRUS DEODARA AND ARAUCARIA IMBRICATA.—The beauty and unique character of the above hardy and most ornamental of all Evergreen Trees are too well known to admit of any comment. Our plants are grown within 500 yards of the wash of the Sea, in this the most eastern point of England, and consequently fully exposed to the gales of the North Sea and German Ocean, which they stand with impunity. It is, therefore, obvious to Noblemen and Gentlemen who purpose planting their Marine Villas, and other exposed situations, that they will not meet with that disappointment so frequently attending plants reared in milder counties. We submit the following scale of prices for robust, handsome, and well-formed plants, either in or out of pots :—

CEDRUS DEODARA... ...	4 to 6 inches	6*s.*	per dozen
" "	12 to 15 "	12*s.*	"
" "	1½ to 2 ft.	20*s.*	"
" "	2 to 2½ ft.	30*s.*	"
" "	3 ft.	42*s.*	"
" "	3½ to 4 ft.	60*s.*	"
" "	large specimens, 15*s.* to 21*s.* each.		

If 100 or more of the above be taken, a considerable reduction will be made.

ARAUCARIA IMBRICATA ...	4 inches	6*s.*	per dozen.
" " ...	1 ft.	30*s.*	"
" " ...	1 ft. to 1½ ft.	42*s.*	"
" " ...	1½ to 2 ft.	60*s.*	"
" " ...	2 to 2½ ft.	80*s.*	"
" " ...	3 ft, fine,	15*s.* each.	

Catalogues will be forwarded free on application. Orders of 2*l.* and upwards are delivered Carriage Free to London or Hull, or to any Railway Station within 150 miles of the Nursery.

YOUELL & Co., Royal Nursery, Great Yarmouth.

PYRAMIDAL PEAR TREES ON THE QUINCE STOCK.

J. AND J. FRASER, NURSERYMEN, Lea Bridge Road, Essex, beg to offer the above in fine strong trees, and such as would fruit the first and second year after planting, at the undernamed prices. These Pears are remarkable for their compact style of growth and prolific bearing; the collection comprises the following fine sorts :—Beurré d'Amanlis, Beurré d'Aremberg, Beurré de Capiaumont, Beurré Diel, Beurré Easter, Beurré Grise d'Hiver, Nouveau, Beurré Rance, Williams's Bon Chretien, Crassane, White Doyenné, Duchesse d'Angoulême, Forelle or Trout Pear, Glout Morceau, Hacon's Incomparable, Jargonelle, Louise Bonne of Jersey, Marie Louise, Napoleon, Winter Nelis, and Passe Colmar.—Price 2*s.* 6*d.* to 3*s.* 6*d.* each.

COLE'S SUPERB CRYSTAL WHITE CELERY.

J. THORNLEY, W. COLE, AND Co., NURSERYMEN, SEEDSMEN, and FLORISTS, Withington, Manchester, beg to announce that they are now prepared to supply this fine Celery at 1*s.* 6*d.* per half-ounce packet, or in larger quantities. This variety has given universal satisfaction, and has been proved to possess all the good qualities attributed to it by W. Cole last season. It can also be procured from the following agents :—

Messrs. Hurst and M'Mullen, 6, Leadenhall Street; Messrs. Noble, Cooper, and Bolton, 152, Fleet Street; Messrs. Minier & Co., 60, Strand; Messrs. Charlwood & Cumming, Covent Garden; Mr. Turner, Slough; Mr. Duncan Hairs, St. Martin's Lane; Mr. Denyer, Gracechurch Street; Mr. J. Fairbairn, Clapham; Messrs. A. Henderson & Co., Pine Apple Place; Messrs. Downie and Laird, Edinburgh; Messrs. F. & J. Dickson, Chester; Messrs. F. & J. Dickson, Manchester; Messrs. J. & J. Fraser, Lea Bridge, Essex; Messrs. Little and Ballantyne, Carlisle; Messrs. Veitch & Son, Exeter; Mr. J. Veitch, Exotic Nursery, Chelsea; Mr. Clarke, King Street, Covent Garden; Messrs. Finney & Co., Gateshead; Mr. A. Pontey, Plymouth; Mr. E. Rendle, Plymouth; Mr. Cattell, Westerham, Kent; Mr. Smith, Riverhead, Kent; Mr. Epps, Ashford and Maidstone, Kent; Messrs. Lucombe, Pince, & Co., Exeter; Mr. Browne, Norwich; J. Cole, Keyfield Nursery, St. Albans; Garaway & Mayes, Bristol; Drummond & Son, Stirling.

All orders to be addressed as above, instead of to "Dartford" as heretofore.

TO NOBLEMEN, GENTLEMEN, AND COMPANIES PLANTING.

THOMAS JACKSON AND SON respectfully invite an inspection of their extensive and fine collection of ORNAMENTAL SHRUBS and TREES; they are of fine growth, and in excellent condition for planting for immediate effect. To the undernamed T. J. & SON especially desire attention. Prices may be obtained by letter or personal application.

American Arbor-vitæ, 2 to 10 ft.
Chinese do., 2 to 8 feet, fine
Arbutus, 2 to 5 feet
Aucubas, 2 to 4 feet, very bushy
Cedar, Deodar, 2 to 12 feet, fine
Cedar of Lebanon, 2 to 9 ft., fine
Variegated Hollies, 2 to 9 feet
Green do., 2 to 9 feet
Weeping do., 5 feet stems, fine
Berberis aquifolium, 2 to 3 feet, bushy
Taxodium sempervirens, 3 to 12 feet, fine
English Yews, 2 to 9 feet
Irish do., 2 to 8 feet, very fine
Tree Box, 2 to 7 feet
Araucaria imbricata, 1 to 5 feet, fine
Deutzia gracilis, 1 to 2 feet, fine
Pinus excelsa, 3 to 8 feet, fine
Pinus insignis, 3 to 5 feet
Cryptomeria japonica, 2 to 6 ft.
Taxus pyramidalis, 2 to 6 feet, fine
Laurustinus, 1 to 3 feet, very bushy
Evergreen Oaks, 2 to 7 feet, fine
Portugal Laurels, 2 to 5 feet
Magnolia acuminata, 4 to 10 ft.
Do. grandiflora Exmouth, 2 to 5 feet, fine
Tree Pæonies, 1 to 3 ft., bushy
Chinese Junipers, 2 to 8 ft., fine
Upright Cypress, 5 to 8 ft., fine
Forsythia viridissima, 2 to 4 ft.
Red Cedars, 3 to 5 feet, fine

T. J. & Son having added to their previously good stock of American Plants, about one-third of the entire stock of the Norbiton Nursery, so long famed for its collections of Hybrid Rhododendrons, Azaleas, &c., can now offer on most advantageous terms—

Rhododendron ponticum, 1 to 5 ft., in great variety.
Do. aureum, and the varieties of yellows, 1 to 7 ft.
Do. Smithi, tigrinum, and other scarlets, 1 to 9 ft.
Do. campanulatum and light varieties, 1 to 7 ft.
Azaleas, Indian, American, and Ghent varieties, 1 to 6 ft.
Kalmia latifolia, and others, 1 to 4 ft.

T. J. & Son have a splendid healthy stock of the Sikkim Rhododendrons, of which they will furnish the 12 following fine kinds, in pots, for 63*s.*, viz., Thompsoni, fulgens, glaucum, glaucum nanum, niveum, Falconeri, ciliatum, Edgeworthi, lancifolium, cinnabarinum, ferruginosum, and calycatum.

Fine Fruit and Forest Trees; strong Quick for Fences, and all other kinds of Nursery Stock.—Nurseries, Kingston near London.

SUPERB LATE WHITE BROCCOLI—"EMPEROR."

EDMUND PHILIP DIXON having purchased the entire stock of the above Broccoli of Messrs. Elletson, Market Gardeners, Thorngumbald, near Hull, begs to announce that after the 1st of January next he will be prepared to send it out in sealed packets at 2*s.* 6*d.* each. This Broccoli has been raised by the Messrs. Elletsons, the raisers of the Mammoth, sent out some time ago, who state that the EMPEROR, if sown at the same time, will come into use before it. Is of very dwarf growth, perfectly hardy, with heads from 15 lbs. to 20 lbs. weight; keeps its colour, and stands firm three weeks after it is ready to cut. A noble flower and commands the best price of any other in the Hull market, where it is well known, and will be a great acquisition to the market gardeners around London, as well as those who wish for a first-rate Broccoli.

May be had of Messrs. NOBLE, COOPER, & BOLTON, 152, Fleet Street; and Messrs. HURST & M'MULLEN, 6, Leadenhall Street, London. Also of the Advertiser, 57, Queen Street, Hull.

PEAS! PEAS! THE BEST VARIETY IN CULTIVATION.

CHAMPION OF ENGLAND, a blue wrinkled Pea, very productive, of quick growth, and of a most delicious flavour. This extraordinary Pea combines in one the merits of all others, and has none of their demerits; for, although a wrinkled Pea, it is both hardy and early, and being of quick growth, it is the best kind to plant throughout the season for each crop. It is highly productive, bearing very long pods of a lively green, which are well filled, and the Peas are generally as large as small horse Beans, of a deep green colour, and beyond all others of a most delicious flavour. Height, 3 ft. to 3½ ft.

Price, in quantities of not less than 1 peck ...	Bag included		6*s.*
" " "	1 bushel	"	16*s.*
" " "	1 sack (4 bushels)	"	60*s.*
" " "	8 bushels (1 qr.)	"	106*s.*

Delivered, freight paid by Railway to London.

Orders, with remittance or satisfactory reference, will have immediate attention on application to

H. AND A. WALLIS, SEEDSMEN, Ipswich.

CAREY TYSO'S CATALOGUE OF FLORISTS' FLOWERS for 1853-4 may be had post free for two labels. TREATISE on the ANEMONE, for four labels. Ditto on RANUNCULUS, for eight labels.

	£.	*s.*	*d.*
RANUNCULUSES: 100 splendid named sorts, 40*s.* to	4	0	0
" 25 superb Seedlings, do.	1	15	0
" 100 fine mixtures from ... 8*s.* ...	1	0	0
DOUBLE ANEMONES: 50 fine named sorts 12*s.* ...	0	15	0
Ranunculus and Anemone Seeds, per paper ...	0	2	6

IMPORTED GERMAN SEEDS :—Asters, Stocks, Balsams, Larkspurs, Poppies, Zinnias, &c., in named assortments, 2*s.* 6*d.* each; 25 varieties of Annuals, 5*s.* The above articles can be sent by post.

C. TYSO's Sovereign assortments, comprising 18 select Ranunculuses and 18 choice Double Anemones, sent postage free for 1*l.* 1*s.*—Wallingford, Berks.

GEORGE MILLS, Uxbridge Road, Ealing, begs to offer Plants of his best BLACK or WHITE-SPINED CUCUMBER, unpacked, at 1*s.* each; packed, 1*s.* 3*d.* each.

MELON PLANTS of the best kinds raised to order on the same terms.

The Gardeners' Chronicle.

SATURDAY, JANUARY 21, 1854.

WE purpose calling attention to a paragraph on spade husbandry in page 247 of Mr. GISBORNE'S "Essays on Agriculture." The paragraph in question belongs to that portion of the posthumous essay, the fourth, which had not been corrected by the author, or been fully approved by the editor of the "Quarterly Review," for which it was designed. And we cannot but think that, had the author lived to make that correction, he would not have permitted so hasty and ill-considered a judgment to go forth into the world on a subject of which he was clearly in utter ignorance.

We are justified in supposing this, because he himself, while living, declared that "nothing is so contemptible as to sneer at [even] unsuccessful experiments;" adding that "truly our very best hopes for agriculture are founded on the entire explosion of the spirit which used to prevail at our farmers' market-tables in this respect." (P. 46.) To confirm our supposition, the editor of the essays assures us that "truth and enlightenment were his sole aim; and that if he were now alive he would have honestly abandoned any demonstrated error; he scorned sinister falsehood and ignorant prejudice—and he had little sympathy with their victims." (Preface.) In full reliance on the sincerity of these declarations, we proceed to point out some grave errors in the passage referred to, which, considering the undoubted popularity of the author in many respects, might tend to mislead the unthinking reader on a point in which a great principle of gardening as well as agriculture is, as we think, deeply concerned.

The passage runs thus :—"Now, a word with the spade-husbandry men; and we shall treat them very curtly, because, among the many humbugs which benevolent individuals have run after, we believe this to be the rankest of all. They found themselves on JETHRO TULL, and say that he discovered that culture would supply the place of manure. He discovered nothing but a mare's nest. The discovery of which they speak would have been

the greatest ever made in agriculture, and such discoveries never die. But TULL's no-discovery has been dead these hundred years. Ancient or modern, there is not a single evidence in his favour except his own. But, they say, garden culture and garden produce. See how a gardener digs, and chops, and trenches. Did they ever know a gardener who would cultivate without manure?" TULL's system of cultivation is considered at length in the "Word in Season," where the author gives a comparative estimate of his practice. It will be sufficient then for our purpose briefly to state here that TULL does assert, without reserve, that culture will supply the place of manure; that the almost only use of manure is to assist in pulverising the soil; and that with wide intervals between single or more rows of the growing plant, any crop could thus be grown successively, year after year, on the same acre of land. But, the plan has been tried, and failed. The difficulty and danger of the required operations; the small average yield, being, of Wheat, only about 16 bushels; the inevitable exhaustion of the soil; all these objections were fatal to TULL's plan; and so, with few and scattered exceptions, it died away. Had this been the scheme against which Mr. GISBORNE had levelled his remarks, they would have required and received no notice from us.

But, here was the grave error into which he fell. By the "spade husbandry men," he clearly meant the author of the "Word in Season," and those who think with him; and, in evident and utter ignorance of the plan proposed by Mr. SMITH, he condemns him curtly and without hearing his evidence, as an unqualified approver of the "no-discovery" of TULL, and as one acting upon it. Why, it was precisely because he differed from TULL that Mr. SMITH proposed another plan, and carried it out, and succeeded, and continues to succeed. It was precisely because of the difficulty and danger, and comparative unprofitableness of the operations of the gifted author of the "horse-hoeing husbandry," that he resorted to the spade or the fork, which perform better work than the plough in a narrower compass; and by these means raised the average produce of Wheat from 16 bushels to 34. It was especially because speedy exhaustion must follow the practice of TULL, who laid it down as a rule that "we must never plough below the staple," that Mr. SMITH varied also the practice here, and digs deep, and brings up the subsoil, and insists besides, in the strongest possible way, on the necessity of manure, *where it is required*. It is required on land in which there is not the necessary supply of the mineral elements of food for the Wheat plant. It is required on all descriptions of land for every other crop, excepting cereals, on the proposed plan. It is required above all in the garden, for there the object is to force, which the Wheat crop will not bear. Why, in all these cases, is manure required? Because Nature, of herself, does not afford a sufficient supply for the purpose. But, on Wheat land, that is, on the great majority of clays and loams, manure is not required by Mr. SMITH for Wheat. Why? Because, for that which is indispensable for man's subsistence Nature has made abundant provision there; because there the manure to feed the Wheat plant already exists—manure of the very same description with that which comes from the yard or the store. Take before winter a portion of the clay or loamy subsoil from the intervals—take just so much as can be well acted upon by the atmosphere, stir it in the spring, mix it in summer with the staple, and with the annual change of the intervals, there will be found in the same acre of land a practically inexhaustible supply of every element of fertility year after year for the growth and perfection of successive crops of Wheat.

Such is the theory proposed by the great improver at Lois Weedon, and carried out by him with signal success for many years. Without discussing just now whether it is indeed the greatest discovery ever made in husbandry, we at least have the indisputable fact that, with reference to Wheat on Wheat land, culture can supply the place of manure, at least for many successive years.

Mr. GISBORNE was not, we trust, the man to misrepresent things knowingly; and in common charity we must suppose that in the instance before us he wrote in entire ignorance of the subject with which he was dealing. The language, indeed, in which his opinion was recorded, sounds more like the after-dinner vociferation at a convivial meeting, than that of a sober-minded critic. Let us hope that the remainder of his essays will bear a more strict examination than that which related to spade husbandry. If not, they must be consigned to oblivion in company with the swarms of trashy pamphlets hatched by Corn-law fermentation in the great political dunghill.

IN this rigorous winter, provisions and fuel having at the same time considerably advanced in price, many are the benevolent persons who, to mitigate the sufferings of the humbler classes, furnish them with soups, but no attempt appears to be made to introduce kinds of food not entering into the dietary of the people of this country, though in constant use abroad. The recommendation that appeared in the *Gard. Chron.* of the 26th Nov. last, to collect scraps from the table and kitchen, and convert them into soup and stews for the poor, might be advantageously adopted in most houses, especially if care were taken not to encourage pauperism by so doing. The habituating the "million" to soups and stews is likely to be of permanent advantage to the people so soon as a good cooking apparatus shall be at their command.

There are already many published receipts for the preparation of cheap and nourishing food, as are those of Count RUMFORD towards the end of the last century, many in the "Family Economist," and those which from time to time have appeared in the *Gardeners' Chronicle*, as, for instance, that which prescribes Sago as a principal ingredient. Still the progress made in adopting new or unusual articles of diet has been so slow, that we gladly lay before our readers the following hints from a very experienced correspondent.

Amongst the many really good articles of food that are habitually used in other countries, though not at all, or but partially, in England, the following may be enumerated:—

Gelatine and the marrow and fat from bones.—Of this nourishing and palatable food enough is thrown away, or, at best, used for the inferior purpose of manure, as would furnish the basis of a pint of rich soup daily to every individual of the town and its suburbs. This fact was ascertained about 25 years ago, and that such soup could be furnished for so little as a halfpenny a pint; the population of the metropolis has greatly increased since that time, but as the consumption of meat in proportion to inhabitants is certainly not less now than it was then, there can be no doubt but that the proportion of bones would be the same. The extraction of the gelatine and fat was, in this instance, by a chemical process, largely employed in a public establishment at Paris, but till it be made familiar in this country, gelatine, though in a less quantity, may be obtained by means of a PAPIN's digester, such as is kept by all considerable ironmongers and kitchen-furniture dealers. It may not be amiss to add that digesters were used at BIRCH's great culinary establishment in Cornhill, and that when a small one was given to a woman with three children, she found that the provision of two days in the ordinary mode of cookery was abundant for three days if prepared in the digester. It is essential, however, that the valve of a digester should be kept perfectly clean, to avoid explosion of the vessel.

Chitterlings.—These are habitually used as skins for sausages, and for black and white puddings, but the greater part of chitterlings is thrown away, or given as food for swine in this country; but in France, under the name of *andouilles*, chitterlings, after due preparation, are enclosed in parts of themselves, and are purchased at about two-thirds of the price of sausages.

Blood of Sheep, Oxen, and Calves.—The blood of pigs is habitually made into black puddings, but that of sheep, oxen, and calves, in most parts of England, is literally allowed to run away in the gutters. Not so in Scotland, for in that part of Great Britain cottagers use as food that of all animals that are slaughtered, stirring it over a fire with salt and oatmeal till the mass is coagulated, and by farmers the blood of sheep is considered a dainty when made into black-puddings, as ALLAN RAMSAY has testified in his "Gentle Shepherd." His SINON, in the invitation to a feast in celebration of the landlord's return to his estates—says

> "Fat are the pudings, hede and feet well sung,*
> And we've enveted neebors auld and young."

Two wethers had been killed for the entertainment, the only animal that would have afforded the basis of these "pudings." In France, too, under the appellation of *sanguettes*, blood with salt, fat, and sweet herbs is constantly prepared in deep dishes over a water-bath, and is sold by the pound by all vendors of partially prepared food.

There are many parts of butchery animals used as food on the continent that are not eaten in England; *mou*, for instance, as lights are called in France, which meat, if tolerably well stewed and seasoned, is exceedingly good; even a bullock's liver—though not comparable with a rump steak or a sirloin—may, if nicely cooked, be made good and nourishing. The Scotch *haggis* is the stomach of a sheep filled with other internal parts chopped small, mixed with oatmeal and fat, and flavoured with Onion and pepper. Scotch Barley broth, made with *Scotch*, not pearl Barley, is exceedingly nourishing. Scotch *brose*, that is, oatmeal stirred into the hot liquor in which salt beef is boiled, may be made, though the bit of beef be but such a morsel as half a pound; and in the same way a rasher of bacon might be made to give zest to a large bulk of Oat or Barley meal. Medical men have held that *bulk* of food is as essential to health as mere nourishment; this should not be forgotten in giving receipts for cheap cookery. It was on this account that Count RUMFORD found it necessary to give hard crusts with his soups; and for the same reason it seems a mistaken policy to sift out more than the coarsest bran from the flour of which bread is to be made; in every part of the Continent of Europe the bread of the great mass of the people is from flour containing more or less of bran or pollard, and in Russia, at the best tables, common Rye bread with bran in it is often preferred to the *sitney* bread, that is of sifted Rye, and to the French bread, as it is called, that is of sifted Wheat flour.

The cottager's wife has many avocations that necessarily prevent constant attendance on her cookery, but surely it would be a humane and pleasing enterprise in a gentleman's or farmer's family to cause sundry dishes to be prepared in their kitchens from articles that are now neglected or despised. The distribution of such food at cost price would be a wholesome lesson to the people, proving that a hot nourishing meal may be obtained at less expense than is now the rasher, or the baker's bread and cheese. And why should not a portion of such fare be served at the master's table? It would need the example of superiors to induce the "million" to eat of food they have hitherto despised. It was thus practised by the gentry during the dearth that occurred towards the end of last century—a dearth so great as to have caused the Act of Parliament prohibiting the sale of *new* bread; it was then a fashion to have some of the cheap foods then recommended to be served at entertainments, as well as at the gentleman's family meals. There has resulted from this *fashion* at least one beneficial effect, that of a very extensive use by the humbler classes of herrings as salted at Yarmouth. There was adopted also at that time a proposition to half salt fish at distant fisheries, so that London might be served with it in an eatable state. Were a hint taken from this, it might turn out a profitable speculation, as well as a great additional supply of food, to marinade or otherwise cook fish on the west coast of Ireland, for example, and to have it conveyed for sale to British towns. Even on our own coasts some kinds of fish are despised for want of a better mode of cooking them—the conger eel, for instance; it is too fat and luscious plainly boiled or baked, but dressed as a curry and eaten with rice it is delicious. Pilchards with spices, or mixed with a dry fish like skate, often a drug in the west of England, might probably find a ready sale in the metropolis at the low price at which they could be profitably afforded.

* Singed.

VEGETABLE PATHOLOGY.—No. III.

2. GENERAL REMARKS.—Before entering on the subject of vegetable pathology, in pursuance of the plan which has been laid down, it may be proper to make a few remarks, either with a view to place it within practicable and useful limits, or to show what may reasonably be expected in the present state of our knowledge.

Now as the main scope of a journal like the *Gardeners' Chronicle* is specific, it would obviously be absurd to enter into any lengthened account of diseases or morbid changes of structure or form in those plants which are not objects of cultivation, except so far as they may throw light on points of more immediate and practical interest. The numerous diseases, for instance, with which Lichens are affected, and the various changes to which they are subject, however interesting in a systematic and physiological point of view, would be wholly out of place here, and would indeed demand a special study for their due apprehension. On the contrary, any maladies immediately affecting an important crop like that of artificial Mushrooms, or plants such as Ferns and their allies, for which there is a large and extensive sale, would fairly come within our province, and any extraneous matter bearing on those points would very properly demand admittance. A due degree of forbearance will therefore be exercised in such matters, so that nothing may be introduced which has not some palpable relation to the end in view.

It is moreover to be premised that novelty is not the object at which the series will aim. The point if possible to be attained, is to present to our readers, without any necessity of further reference, whatever, within certain prescribed limits, has a direct bearing on diseased action in vegetables. Facts, and not merely ingenious theories unsupported by experiments are what is wanted, and these stated in clear and simple language, so as with an ordinary degree of attention to be perfectly intelligible by themselves. It may not indeed always be possible to speak without hesitation, from the absence of such complete information as may satisfy every requirement, and the more especially, because even in points where the difficulties involved may not be deemed insurmountable,

recorded observations are either too recent, or so far unsupported by a multitude of evidence, as to justify a reasonable degree of doubt. It must be remembered, besides, that vegetable pathology is comparatively in a state of infancy. The last 10 years indeed have conspired to call the attention of physiologists to morbid structures in vegetables, and the causes from which they are derived, and much light has in consequence been thrown on points which were before involved in obscurity, but still the amount of information which has been obtained is nothing in comparison of what a full development of the subject would demand. If it is recollected how many thousands, urged by every motive of ambition, gain, or a simple love of truth, have been engaged for centuries on the sister science of animal pathology, the immense mass of experience which has been gained, the multitudes of direct observations and experiments which are registered for constant reference, and these sifted and scrutinised so as to eliminate every possible or probable error, and that, after all, the functions of many organs which are obvious to the most superficial examination, are either wholly unknown or very imperfectly understood; and much more when we consider the subject of disease itself, its mode of origination and communication, or even, where the proximate cause is ascertained, its manner of action, it can be no matter of surprise if the vegetable pathologist is not always in a condition to speak positively, even though it be taken into account that he has less complicated organisms to deal with. And then, again, if the history of disease is contemplated, and we have not far to go for an example, when we find that a malady like that of Asiatic cholera has been ravaging the earth for nearly thirty years, counting its victims by millions, that every practician of any weight or authority has had all his powers of observation and intelligence on the stretch to find a remedy, and that, instead of witnessing any increased power of controlling the disease in individual cases when once established, we have seen it recently even more unmanageable than on any former occasion, it need not be made matter of reproach, as is so frequently the case, against vegetable pathologists, that they can merely describe disease and prate about the causes without discovering any certain remedy. Indeed, the illustration just introduced by way of comparison may be further extended. It is confessed that diseases in the vegetable kingdom when once established are for the most part uncontrollable; they are like consumption or other fatal maladies to which the aid of medicine is called, when nothing more than palliation can be supplied, the prevention of which ascends far higher than to be subject to the control of one generation of physicians, or the influence of a few short years on general habits, on which they are more or less dependent for their origin. But though little may be effected, or be even within the bounds of possibility when once disease has been developed, and though established habits, however fatal in their consequences, are difficult of change, still occasionally, provided there be rational grounds of action, much may be done by way of prevention. The removal of the causes of disease, or perhaps rather of those accidental circumstances which favour or aggravate its development, was attended with complete success in the late prevalence of cholera, although remedies and appliances seemed wholly ineffectual where the disease was once established, and this, be it remembered, in consequence of the powers of mind which had been applied to its investigation by persons of the highest intelligence; and so exactly in the vegetable kingdom, though it may be and is, in many instances, impossible to cure a disease when once contracted—as, for instance, bunt or deep-seated canker—it may be very possible to prevent its occurrence, or to keep them within reasonable bounds. Sometimes, indeed, the cause may be inveterate, and admit of remedy only by a long and painful course, or be so dependent on general habit as to make all hope of immediate or speedy alleviation desperate. Take, for instance, scrofulous affections or insanity by way of comparison. If proper prudence were exercised in the formation of alliances between families, or habits of a vicious tendency as regards these diseases could be controlled by general opinion, there can be no doubt that either disease would, to a very great extent, disappear; and so again in the vegetable world. It is acknowledged that the objects of cultivation have a greater tendency to disease now than the experience of earlier years would justify us in attributing merely to temporary circumstances; and it is also tolerably clear that this tendency depends on a higher system of manuring, and a want of care in the selection of seed produced under circumstances which might insure health; but then the difficulties in the way of the preparation of such seed in a sufficient quantity to supply the demands of cultivation, and the impossibility of at once controlling any habits or practices generally established, are so insurmountable that the vegetable pathologist must, like the moralist, wrap himself up in his own virtue, and cast his bread upon the waters, assured that it will be found after many days, if not by himself, at least by his fellowmen in some succeeding generation. *M. J. B.*

DIPLADENIA SPLENDENS.

The large, Convolvulus-like, and exquisitely coloured blossoms of this plant are hardly matched by those of any twiner with which I am acquainted, and, under proper management, its charming flowers are produced very abundantly for some two or three months in succession. Notwithstanding that it is perhaps the finest of all twiners which we possess, it is by no means universally cultivated; for in the hands of many it is found to bloom very shyly, or not at all, consequently it has never received the attention which it deserves. To insure success in its culture, a light, warm, moist situation, and a brisk bottom heat are indispensable, and where such accommodation cannot be commanded, it is useless to attempt to grow it; with proper convenience, however, it grows very rapidly, and blooms abundantly.

Cuttings made of short-jointed, half ripe shoots, root freely if inserted in sandy, peaty soil, covered with a bell-glass, and afforded a sharp bottom heat. They should be got in as early in the season as possible, potted off immediately they are found to be sufficiently rooted, and kept growing in a brisk bottom heat, with a close, moist atmosphere, so as to get them strong and well established in 6-inch pots in the course of the season, in which state there will be no danger of losing them during winter. In autumn gradually reduce the supply of water, and expose the plants to a circulation of warm dry air, in order to ripen the wood, and when this is effected remove them to a house where the temperature may average from 50° to 60°, and allow them a period of rest, giving no water to the soil during that season. Towards the end of January, or as soon afterwards as circumstances will admit, turn the plants out of their pots, shaking away a portion of the old soil, so as to be able to repot them in fresh material without using much larger pots, at the same time cutting back the shoot to a strong bud near the base. Be careful to have the fresh soil in a moist, healthy state, so as to prevent the necessity of giving much water until growth shall have commenced, and the roots taken to the soil. After potting place the plants in a pit, or house, where the atmosphere is kept warm and moist, and where the pots can be plunged in a bottom heat of about 80°, syringing over-head in the morning and evening of fine days. Here growth will soon commence, and when this is the case give a more liberal supply of water at the root.

As the shoots advance keep them regularly tied to supports, in order to prevent their being broken, and as soon as the roots get good hold of the soil, shift into the flowering pots, which, for the present season, should not be larger than 12-inch ones. Return the plants after shifting to a brisk bottom heat, and maintain a warm moist atmosphere, to induce active growth. Decide upon the method of training to be adopted at once, and keep the shoots regularly tied in, placing them sufficiently far apart to insure the production of strong, short-jointed wood, and to induce the formation of side shoots, upon which the flowers are borne. Whilst it may be desirable to ensure active growth, give a liberal supply of manure water to the soil, syringing the plants overhead morning and evening, and maintaining a moist warm atmosphere; but avoid much shading, the only result of which is to induce the production of soft spongy wood, from which flowers can hardly be expected. When a good-sized plant is obtained, unless it begins to show for flowering, give less water at the root, and a freer circulation of air, with full exposure to sunshine, which will check the tendency to growth, and assist in inducing the formation of flowers. The specimens may be removed to a close part of the conservatory while in bloom, where they will flower in great perfection for some two months, but care must be observed to prepare them for the change by rendering it gradual. And specimens intended to be removed to the conservatory while in flower should be started into growth early in spring, so as to have them in flower in June, in which month the temperature of the conservatory will, with a little care, as to placing them in the warmest corner, be suitable for them, but plants blooming late in autumn must be afforded the temperature of an intermediate house. Give a liberal supply of manure-water to the soil during the blooming season, and carefully guard the blossoms from the effects of damp, by which they are very easily injured.

When the beauty of the specimens is over remove them to a light airy part of a house, giving a sparing supply of water to the soil, and when the wood is well ripened discontinue the application of water altogether during the period of rest, which should not be less than six weeks or two months. By annually shaking the greater portion of the old soil from amongst the roots, so as to allow of repotting in fresh soil, trimming away any unhealthy roots, and properly cutting back the shoots, the specimens will last for several seasons.

The most suitable soil for this Dipladenia is good fresh turfy loam, leaf soil, and fibrous peat, in about equal proportions, with a liberal admixture of sharp sand and lumpy pieces of charcoal to keep the mass open and porous. It is a very good practice to slightly bake the leaf soil before using it, so as to destroy any worms it may contain, which are very mischevious to plants in bottom-heat. *Alpha.*

Home Correspondence.

The Seed Market.—Among the absurdities of former times which ought to have died out long ago is the all-prevailing fallacy that no seeds but those that are new, that is of the preceding year's growth, can be good, or ought to be used for horticultural purposes. Now, if such was really the fact, what would be the consequence at the present moment? why, that a great number of our finest vegetables and flowers would go out of cultivation, for it is notorious that the season of 1853 was the worst for saving seeds, not only in England, but also on the Continent, in the memory of the "oldest inhabitant." Many things are a complete failure, and all new seeds are bad, not only of low vegetative power, but being necessarily immature, are deficient in true and life-invigorating pabulum, and consequently they will not only grow indifferently, but the plants produced, especially among Brassicas, even though from a true stock, will lack their usual pure character. All the trade lists now before me have one complaint, that of the badness of the season, and the scarcity of many things. Vilmorin Andrieux & Co. say, "We are extremely sorry the list of vegetable seeds is so very poor; this is caused by the general failure of the crops, in consequence of which a certain number of articles which have been demanded eagerly on account of their scarcity are already exhausted by previous orders." One of the leading London houses says, "Radish is exceedingly scarce, Lettuce a complete failure. Round seeds, though deficient in quality, have not suffered so much as light seeds, as Carrot, Mangold, &c.; Onion is higher, agricultural Turnip by no means plentiful, Peas deficient in quantity, samples better than might be expected; Wrinkled or Marrow Peas, however, are of very indifferent quality." Nor is this all; new seeds are not only very bad, but they are also very dear; the wholesale price of Lettuce, the finest kinds of Cos, is just 50 per cent. more than the retail prices of respectable houses for some years past, and many other things are in the same proportion. Of course the old remedy of "sowing thick" is recommended, and I should further advise those who cannot insure nice curdy Cauliflower and Broccoli to "keep friends with the cook," for their new seeds will produce plenty of "froth." But it is not so necessary to point out the badness of the last seed harvest, as to demonstrate the absurdity of the prevailing opinion that seeds must be new to be good. It is true light seeds, such as Lettuce, are not improved by keeping, but if kept clean and free from damp and atmospheric moisture it will vegetate at seven years old, Carrot at five, Beet and Mangold the same, Onion six to seven, and round seeds, such as Broccoli, Cabbage, and Turnips, almost at any age. Last season I had some seed of Atkins's Matchless Cabbage sent to me, which I have reason to know was 14 years old, having been kept by a friend from the original stock sent out by Mr. Atkins. It was sown under a hand-glass and covered slightly with fine soil, and at least 90 per cent. of the seed vegetated. This seed had been dried and tightly corked and sealed in a bottle, and kept in a dry closet, only being opened once or twice in a season to get seed for sowing, and there it is as fresh and good as if fresh gathered. In a field in Hertfordshire upon which Stone Turnips had been grown for seed, and a good part of which was lost, a crop of Turnips appeared every time the ground was turned up, for nine years to my knowledge, and how long afterwards I know not. Of heavy seeds, Wrinkled or Marrow Peas suffer the most from age; indeed, unless the seed is unusually well ripened, it vegetates badly the second year, and is quite useless for purposes of growth; the third, French Beans and Scarlet Runners denote by their colour that their season is past, and the same may be said of Broad Beans, which can hardly be trusted the second year. Early and Round Peas will grow when six or seven years old. Apart, however, from their vegetative power, new seed, if sown directly it is gathered, especially of such things as Cauliflower and Broccoli or Cabbage, never produces so good a sample of plants, or comes into cutting so soon and regular as plants raised from old seed; and I learn from one of the most extensive market growers that Cauliflower plants raised from old seed will be "in cut" from 10 days to a fortnight earlier than plants from new seed sown on the same day, and be less likely to come frothy. Now this is an important fact, but only one which science would expect practice to confirm, it being an incontrovertible fact that new seeds are not only scarce but deficient in quality, and as it is equally certain that old stores of "trio," and other questionable seeds must be used as make-weights in this season of general scarcity, it will be well that other precautions in addition to the old one of "sowing thick" should be observed. Practically I should recommend the growing quality of all seeds to be tried before sowing for a general crop, not in a strong heat or hot-bed, for that would be no test in a season like this, with the ground excessively cold and full of "snow broth," but by sowing in pots and placing them in a cool greenhouse or under the protection of a hand-glass or cold frame; for many seeds, especially light ones, such as Parsnip, Carrot, and Onion, though they may grow tolerably well with summer heat, will scarcely grow at all in the cold ground. If the vegetative power is 75 in 100 seeds, it may be trusted in the open ground, but if only 50 grows, double the usual quantity should be sown. Round seeds should be similarly tried, and even Peas (especially the wrinkled ones), Beans, and French Beans should be sprouted, or just started before they are sown for the early crops; indeed such crops would be best raised in pots or boxes or on turf, for the extra trouble is little as compared with the certainty of the crop, and much seed may be saved. One of the finest crops of late Peas I ever saw was raised in 6-inch pots, and then planted out on a deeply trenched and well manured border, in single clumps like Dahlias, at 4 feet apart; they were afterwards mulched with manure and a coating of short Grass, and being well attended to with manure water, nothing could exceed either the quantity or the quality of the crop they produced. I am quite certain a pint of seed so managed will produce as many Peas as two

quarts under ordinary treatment. In sowing early crops of all kinds, particularly upon heavy ground, it will be wise to cover with some light, dry soil, intermixed with burnt earth and soot, or even fine cinder ashes. This has been a rule with the writer, who had to contend with an unusually heavy soil for many years, and I am quite convinced of the advantages of the plan, not for early crops alone, but practised throughout the season. Having now pointed out the absurdity of the "new seed" cry, especially in a season like the present, when it is notorious there is of many things little or none to offer, and having also shown that many seeds, if properly preserved, are as good at five or even 10 years old as when fresh gathered, let me supply the means by which the trade, if so disposed, and gardeners in particular, may depend upon their stock being true to name, and coming in at the right season, and in proper succession. To insure this, nothing more is necessary than to procure sufficient seed this season to give a supply for two years, and by sowing just a pinch of each to produce a score or so of plants to prove the variety, if true or suitable, may be sown next year for the main supply, and by continuing the rule of purchasing and proving the seeds annually prior to using them for the principal crop, all disappointment both to the seedsman and gardener may be avoided. I know nothing more annoying to a gardener or indeed perilous to his reputation than to plant out a breadth of Broccoli, expecting it to come in for autumn supply, than to find it unfit for use until the following March or April; yet how often is this the case with Grange's Cauliflower Broccoli and what is called Autumn-sprouting, and many other kinds? It will be naturally inferred that I have little faith in seeds as supplied to the public generally. I certainly have not; for to such a length has competition run, and so wretchedly poor is the price paid for growing, that growers care little for the quality so long as they can get a quantity of seed to weigh or measure. In fact, the seed trade is rotten, bad to the core, so bad that not a twentieth part of the seeds in any catalogue in London could be guaranteed to be true to name. Last year I had six kinds of Cabbage from one of the principal houses in the trade, and they were sent as ordered with the following names—Early York, Enfield Market, Atkins's Matchless, Wheeler's Imperial, Preston's Victoria, and Vanack, and now they are proved they are all the same kind, and if not all supplied from the same bag or drawer they might as well have been. But it is unfortunately the rule, even with the most respectable houses, to supply everything ordered, so that it matters little what names are used, something that will tell in the bill is sure to be attached to them; nor are the trade altogether to be blamed, for if they were to be honest, and say "not known," "unworthy of cultivation," "not to be procured this season," or any similar remark, they would be set down as very second-rate people, and quite unworthy of support in future. This, good public, is your rule; you offer a premium to dishonesty, and leave the just dealer to pay the penalty of his attempt at fair dealing. Such, however, is the morality (save the mark!) of trade at the present time, not in our own alone, but I fear in almost every other. *Judex, Jan* 10.

Orchard Houses.—Of all the fruit I ever ate at home or abroad I never tasted such high flavoured Apricots as those I ripened in one of Rivers's orchard houses in my garden last summer. The pots were not more than 13 inches in diameter, and the trees only the second year of being planted. The sorts were various, but the best bearer was the Moor Park; Plums, Peaches, and Nectarines bore abundantly, and suffered in flavour with me from not having thinned them. The Cherry trees promise great crops this season, but they did not respond to the care taken of them the first year, as the Apricots did. Pears bore well this year, but they do not seem to reach perfection like the stone fruit. I had splendid fruit ripen on my wall (Moor Park), but not comparable in flavour with those in the orchard house. Had I to begin gardening again I should exclusively cultivate the best stone fruit in orchard houses, and leave walls for Pears only, the certainty of immediate fructification being the grand recommendation of the orchard house; and how much cheaper in construction than lofty walls! As Mr. Rivers says, "You get in these fruit houses the climate of the south of France, with little cost and no more care than every gardener derives pleasure from, in cultivating the fruits and flowers of the earth." In many instances the recompense comes in the first season, having gathered myself the year the house was made both Pears, Plums, and Cherries. Consult "Rivers' Orchard House," sold by Longman, Brown, and Co., Paternoster Row, and the cultivator is sure to succeed. *Wm. Mason, Necton, Norfolk, Jan.* 15.

Aëration of Plant-houses.—Your remarks on this subject, and the acknowledged difficulty in practically effecting it, induces me to submit my attempt, and I do so, because I think success attends it; but the discussion of the matter must do good. My theory is very old. Every one admits and knows that air when heated is lighter than it was before, and ascends; but the converse is not so generally thought of—viz., that cool air descends: on this thought I acted. My plant-house is quite a small affair; a long narrow lean-to place, between two walls, 32 feet long by 7 wide, where my plants were alternately coddled with damp, and burnt up with heat. It is about three weeks ago that I determined to try to improve their forlorn appearance; and I argued thus. If I will let it, the warm used-up air which accumulates at the ridge of this place, will go off of itself, and if I will but allow it the pure cool air from outside would cheerfully come in to occupy the place of the other: and this will I do, I will put the excess of weight of the cool air to move and lift out of the way the warm effete useless air at the ridge. So I had a box made without top or bottom, with a partition down the middle; one compartment was 1 foot deeper than the other; the shallow side was put next the back wall, the deep side then hung down 1 foot in the house, only perpendicular. The box was the whole width of the sash and 2 feet across from back to front; the sash was slid down, this box put in the opening, and in a very little time the effect on the air of the house was perceptible to the feelings. Since then this rude ventilating apparatus has been in action night and day to the manifest improvement of my plants, which seem to rejoice in the gentle abundance of air, whilst not the tiniest spray or leaf is moved thereby; and this morning I saw their edges decorated with beautiful beads of dew. Since this was put in I have fitted another to a plant pit adjoining, and with the same good results. Both pit and house are warmed by hot water, and I find no difficulty in obtaining plenty of heat; for, as the air is in constant motion, whilst the pipes have ever so small an excess of heat above the air of the house, they are constantly parting with it; and I have no doubt that if it was a measurable quantity the whole amount of heat given out is more than was given when the house was entirely closed. I give some temperatures, the times nearly 8 o'clock morning and evening.

	External.	Internal.	
Dec. 29 ...	Morning... 4° !	34°	
	Evening . 22	45	
„ 30 ...	Morning . 34	44	Fire out; pipes cool.

J. P. S., Chesterford, Essex.

Botanical Nomenclature.—Pray tell me if I am to call an old favourite ever-blooming Rose "A China Rose," according to Loudon; or "Chinese Rose," according to some of our more recent writers on Roses? If the latter, it appears to me, that we must also call our cups and saucers "Chinese ware," instead of using an universal word "China." Loudon and some botanical authors also write Briar, according to Johnson it is Brier, which should it be? *Rosa.* [These are matters of taste and custom, upon which we can offer no opinion. For ourselves we prefer China Rose.]

Weather in Dorsetshire.—I perceive that four most important days were omitted in the list of temperatures for December, 1853, which was published last week (see p. 22). The following memorandum will supply the defect:—

1853 Date.	Cold of the Night. Thermometer at 9 A.M.	Rain Gauge.	Heat of the Day. Thermometer at 9 P.M.	Barometer.	Wind.	Observations.
Dec. 28	16	20	24	28	21	$29\frac{7}{10}$	NW	Clear.
29	10	12	...	29	16	$29\frac{9}{10}$	W	Clear.
30	16	34	...	37	24	$29\frac{41}{10}$	W	Overcast.
31	22	28	...	35	24	$29\frac{4}{10}$	W	Haze with clouds.

In spite of all the appearance of thaw, we have had slight frosts for a few hours every night lately, and in shady places and lanes, and on the hills, the ground is still hard frozen below and slippery above. The ice is very slow in melting on any piece of water; it has been 3 inches thick. *W. F. S., Melbury, Dorset.*

C. B. N. P.

The Woods and Forests.—I have taken your advice, and read the last blue book; and I own myself unable to conceive how you can delay, what is your plain public duty, a continued exposure of the incredible incompetency of the inferior Government officers, and of the agents by whom the Treasury had been advised in former years. I have had too much experience of the gentlemen in Whitehall to believe that they will leave off jobbing except upon compulsion. The whole tenour of the Commissioners' last report, and of the evidence on which it is founded, shows that there is a dogged resistance to improvement, and a determination, somewhere or other, to uphold the most glaring abuses. Look, for example, at the New Forest, near which I live, and which has been for years a national scandal. Look at the official reports upon Dean, Delamere, and others, and consider whether it is possible to reconcile silence with an honest fulfilment of the trust reposed by the country in the judgment and impartiality of the Editor of the *Gardeners' Chronicle*.

*** *Lymington.* [Wait a little longer.]

Horticultural Statistics.—The detailed statistical account of the nurseries near Niort, which appeared in the *Gardeners' Chronicle* of the 31st ult., takes no notice of the value of the interest on the capital lying dead for six years. The loss of this interest is, however, no less an expense incurred than is the rent the nurseryman pays for the ground he cultivates; for, supposing a capitalist—great or small—to place his money out at interest, and to add that interest half-yearly to his original capital, he would find it, at 5 per cent., to be doubled in between 14 and 15 years. Though the rate of interest varies at different times, and according to circumstances, it may be concluded that a nurseryman would not obtain a loan of money at less than 5 per cent. per annum; accordingly a calculation has been made at that rate of this item of expense in the nurseries at Niort, excluding fractions, as also the money expended from time to time during the six years for digging, hoeing, and manure. The land in nurseries near Niort is stated to amount to 74 acres 32 perches, and is said by this species of cultivation to give in six years a profit of 3438*l.*, but that profit would be reduced by between 360*l.* and 370*l.* were the compound interest taken into account of the capital expended in the first of the six years, namely, for trenching, and for the stock of young plants. *B.*

Winter Cucumbers.—Observing (see p. 775, 1853) some account of a Cucumber having been cut in December last, measuring 18 inches long, and also notice taken (see p. 19, 1854) of another having been cut in January last 23 inches long, has induced me to furnish you with the number of Cucumbers cut here during these last three months. But in the first place let me give the dimensions of the house and an account of the mode of heating. The house is span-roofed, 34 feet long by 11½ feet wide, and is heated by a hot-water pipe running round the outside of the brickwork which forms the bed. A flow and return pipe supplies top heat, and for bottom heat I have the same in a 2 feet chamber running the whole length and breadth of the bed. I planted 18 plants on the 25th of August, and I cut the first Cucumber on the 7th of October; since then I have cut from the same plants 151 fruit measuring from 12 to 20 inches in length. The house being employed for the culture of Cucumbers in winter and Melons in summer, I am obliged to destroy the Cucumbers to make room for the Melons. Another house heated upon the same plan is now yielding most beautiful fruit, and though cut from daily they promise a very lengthened supply. *G. James, Pontypool Park, Monmouthshire.*

Cooking Stoves.—The American stove of which Dr. M'Cormack speaks at p. 22 is doubtless similar to that now for sale in Poland Street. One of the kind has been long used to cook the dinners of numerous inmates, and has been found economical; but it being of iron, it is objectionable on account of its requiring frequent attention to the fire, though it be of coke. The smallest size of these American stoves considerably exceeds the wants of the cottager, and it could not on that plan be made on a smaller scale without losing the advantage it derives from the passage of a flue round the large oven. The public are indebted to the Dr. for his bringing to notice the French delf stoves; they are in general use in that country for heating apartments of secondary importance, as also dining rooms. Some of the lesser ones are provided with an oven of sheet iron, and many of the lower orders of the people in Paris cook in it a considerable part of their food. But the pottery of which these stoves are made is very liable to crack, even with a wood fire, and certainly would not bear the intense heat of coals. Not so the Russian and Swedish stoves, also of pottery, for they bear with impunity the burning in them a pile of Birch wood measuring a cubic archive (28 inches), when placed so as to be speedily consumed; for it is desirable in these stoves to burn the wood to braize as speedily as possible, in order to shut up the stove with a great body of live braize within it. All of these stoves, French, Russian, and Swedish, have a particularly neat and clean appearance, their surface being a kind of white enamel, and they are very easily washed. A small delf stove, having its oven, was a few years ago purchased for a louis (20*s.*), in a provincial town in France; so that doubtless a cottager's stove of pottery might be manufactured and sold in England at even a lower price than is charged for an iron one; but it would seem that potters would be the most competent persons to contrive a suitable stove, its durability depending so materially on the kind of ware employed in its manufacture. *B.*

Gold-fish in Frozen Ponds.—Are any of those good people (who are always telling you to break the ice in your ponds) aware that gold-fish in China, their native place, live in rivers which are frozen over every year; one would suppose that these fishes were small whales which were obliged to come to the surface for air, which true fish, of course, never do; and the reason why you must break the ice in your ponds is that if allowed to continue freezing it lowers the temperature of the water, so that the fish are starved from cold, not want of air. If your correspondent's ponds were as deep as mine, more than 4 feet in every part, he might allow the ice to remain untouched in ordinary winters. I believe

the fish bury themselves in the mud near the borders, and so are soon killed; but most fish-ponds are too shallow. Mine is not 22 feet across, and has been frozen for more than a week at a time, and I have never lost one; my chief enemies are owls. Common carp can be transported in a frozen state and thawed again alive!
Somerset.

Societies.

Horticultural, *Jan.* 17.—J. R. Gowen, Esq., Treasurer, in the chair. The Duke of Rutland, E. Rosher, Esq., and G. H. Taylor, Esq., were elected Fellows. Of English Grapes, exhibitions of which were specially invited on this occasion, Mr. Forbes, gr. to the Duke of Bedford at Woburn Abbey, sent six bunches of Black Hamburgh, three being this year's produce and three retarded fruit of last season's growth. The latter were remarkable for the small amount of shrivelling which they possessed, being indeed almost as plump and fresh as the new bunches, which were also finely ripened and coloured. These well deserved the Banksian Medal which was awarded them. Other Grapes consisted entirely of last year's produce; by far the best among them were three bunches of Muscats from Mr. Wortley, gr. to Mrs. Maubert, of Norwood. These had large well-ripened berries, scarcely at all shrivelled. A Certificate of Merit was awarded them. Other Muscats, considerably past their best, were furnished by Mr. Thomson, gr. to Mrs. Byng, at Wrotham Park; and Mr. Munro, gr. to Mrs. Oddie, of Colney House, St. Alban's; the latter also sent some indifferent bunches of West's St. Peters.—Mr. Jones, gr. to Lady Charlotte Guest, sent a Queen Pine Apple, weighing 3 lbs. 7 oz. It was reported to have been grown in a mixture of turfy peat, sand, and broken oyster shells, which Mr. Jones is of opinion will prove to be a good compost for winter fruit.—M. Langelier again furnished examples of Pears from Jersey, which, independent of any merit belonging to them, are valuable as showing what fruits are cultivated under certain names in the Channel Islands. One labelled Duchesse de Berri appeared to be Mons. le Curé; Rous Lench was Jaminette; Beurré de Flandres was B. Rance; Winter Crassane was true, and there were two kinds unknown, viz., Beurré de Zabert and Epine de touris. M. Webber & Co., of Covent Garden, sent very fine specimens, for the season, of Beurré Rance and Easter Beurré, Winter Nelis, Ne Plus Meuris, Old Colmar, and Jean de Witte. These, it may be remarked, were all quite true to name. —A Certificate of Merit was awarded to Mr. Brown, gr. to J. Parnell, Esq., of Waltham Abbey, for a dish of Cuthill's Black Prince Strawberry, again stated to be a sure setter, and altogether a good sort for early forcing. —From Messrs. Jackson & Son, of Kingston, came three kinds of Orchids, viz., Warrea Lindeniana, a good variety of Lycaste Skinneri, and the purple Barkeria Skinneri. A Banksian Medal was awarded.—J. Luscombe, Esq., of Combe Royal, near Kingsbridge, sent some cut specimens of plants in illustration of the mildness of the climate of Devon. Among them was a bunch of flowers of Luculia gratissima, which had wintered satisfactorily, and expanded its blooms on an east wall near a chimney, with no other protection than that of a ragged mat, or more recently, when the weather became colder, that of a wooden shutter; also a flowering spike of Linum trigynum, which was stated to be growing on an open wall without any protection, and beside it Gardenia Fortuni was reported to be in fair condition, thus showing how favourable the climate of South Devon must be for the growth of tender plants. —From E. Brande, Esq., of Turnham Green, came specimens of glass labels. They were made in the same way as common apothecaries' phials, except that they had their tops closed up and their bottoms cut off. The latter is done for the purpose of admitting a slip of common paper (on which the name is written) into the bottle in such a manner that it can be most easily read through the glass, and then the end is stopped up with a common cork. This kind of label was more especially recommended for use in glass houses, where they would not be blown about and broken. They have this advantage over Mr. Bohn's glass labels, that the names can be changed at pleasure; whereas, Mr. B.'s, when once hermetically closed, as they are by the blow-pipe, do not admit of the label being altered. Specimens, showing the effect upon roots of Mr. M'Glashen's transplanting apparatus, were exhibited. It was mentioned that this apparatus has been objected to on account of the root-pruning a tree lifted by it necessarily sustains, and the rough manner in which it is wrenched by it out of the ground. It was further stated that although the transplanting of the large tree in the Society's Garden, at Chiswick, had proved perfectly successful, yet that some had attributed that success rather to the tree being a Poplar, one of the least liable of all trees to die from the operation of moving, and to the ground and weather favouring its well-doing, than to any merit that belonged to the machine. Mr. M'Glashen, however, opposes this view of the matter, and states that he has lifted above 1200 trees with perfect success by his apparatus, and he sent from Edinburgh the root and top of a Scotch Fir transplanted by his contrivance, to show that wherever the principal roots had been divided by the spades of his machine they had thrown out healthy young rootlets in the greatest possible profusion from the shortened stumps, giving the tree even greater facilities of collecting food than it had before it was moved. The top (which for convenience of carriage was separated from the root) also showed that it had received no check whatever in its growth, and there were other roots likewise confirmatory of the success of his mode of transplanting. A letter from Mr. Black, at Hamilton Palace, was also read, in which it was stated that 14 large evergreens moved for the Duke of Hamilton by Mr. M'Glashen's machine all had succeeded most satisfactorily, and scarcely showed any symptoms of having been removed, their rates of growth having been in no way impeded by the root-pruning they had sustained in the moving. Among them were Portugal Laurels of large size; Yews from 9 to 12 ft. high; Arbor-vitæs, from 14 to 16 ft. high; and Hollies, 10 to 15 ft. in height; all of which, as has already been stated, have succeeded perfectly. It was stated, however, that although the evidence, so far as it went, was quite satisfactory, yet that it did not settle the question, because it must be admitted that there is a great difference between the demand made on the roots by a tree 15 feet high and one 50 feet in height. The results of moving very large trees by this machine have, therefore, yet to be ascertained.—From the garden of the Society came various Corræas, Gesnera zebrina, Selago distans, Linum trigynum, a gay plant at this season; Acacia lineata, Thyrsacanthus rutilans, a promising scarlet-flowered plant, and the following salad vegetables, viz., Chou de Naples and Romaine Verte Maraichère Lettuces, both from frames; the Corn Salads Mache ronde and Mache d'Italie, Scarlet Short-top Radish from frames; Curled Cress, White Mustard, American Cress, Cole's Superb Red and Sutton's Superb Pink Celery, a very good variety; also Celeri Court-hatif, very full and solid, and by many preferred to the last-named kinds; Curled Chervil, French, Garden, and Broad-leaved Sorrel; in the late severe weather these required to be taken up out of the border and placed in a frame with a little heat; also Oseille de Belleville, a milder sort than the other Sorrels; together with Burnet, Chicorée fine d'Eté, an excellent curled Endive for all seasons; and Scarole à fleur blanche, which blanches exceedingly pure—like ivory; Betterave rouge plat de Bassano, grosse longue de Hollande (Van Houtte), rouge de Castlenaudary, this is the most generally esteemed; and Barret's Crimson and Cattel's Blood-red Beet.

Notices of Books.

Scenes and Occupations of Country Life. By E. Jesse, Esq. New and revised edition. Murray. 12mo.

We formerly spoke with praise of this pleasant country book, and are now happy to announce its reappearance with rather considerable additions. Among other things there is a most interesting account of the hippopotamus in the Zoological Gardens, from the pen of Prof. Owen, from which we must borrow the history of the creature's being led into captivity:—

"The Nubian soldiers who had been commanded by the Pacha of Egypt to procure and send down to Cairo a young living Hippopotamus, hunted along the most shaded banks and least frequented parts of the White Nile for a female and her calf, for they were aware that the time for the bringing forth of the young was the month of July. They had killed several old hippopotami without succeeding in capturing a young one; when towards the evening, having mortally wounded a large animal, which from the minor development of the tusks they knew to be a female, they were struck by observing that instead of diving, after receiving the mortal wound, she endeavoured to make her way towards a small wooded island, evidently desirous of reaching it, but sank before she could gain the banks. This aroused the suspicions of the Nubians, and a party of them, headed by an intelligent subaltern, named 'Hamet,' put off in a small raft boat to the island. The density of the shrubs and herbage at the steep banks made the landing difficult, but, when it was effected, they found in a snug leafy hollow, where the branches and creepers had been trodden down into a thick elastic bed, an obese, smooth, and shining dark-coloured object, like a hydrocephalic corpulent hog, that had undergone the operation of scalding. The creature stared at them with a pair of protuberant juicy eyes, and uttered a short interrogative grunt. On the first step forwards made by one of the soldiers to seize the prize, the young animal instinctively sprang forwards; and, with a degree of agility for which they had not given it credit, it forced its way through the opposite brushwood down the steep bank. Hamet, who had witnessed the movement, seized the boat-hook, ran to meet the young animal, and was in time to arrest its progress by striking the hook into its haunch, just as it was making its plunge into the stream. He seized, and bore it grunting and snorting for its dam, to the boat, the burden being as much as his strength would permit him to carry, and the party then made off triumphantly with their prize. But how to nourish the young suckling? Teeth at that period the broad gaping mouth showed none; but it was fenced round by thick, soft, fleshy lips, the very model for effectually exhausting the loaded dugs of a teeming mother. The difficulty was summarily solved by the characteristic relations of the governors and governed in long enthralled Egypt. The boats of the party anchored opposite the first village, the milch-kine were driven down to the boats, their udders drained into a vast calabash, and this was speedily emptied by the hungry foundling. The process was repeated at each village as the *cortège* descended the Nile towards Cairo, and the young hippopotamus was finally left in excellent condition, and with the Pacha's compliments, at the court-yard gate of our active and excellent Chargé d'Affaires, the Hon. Charles Murray."

When we add that Mr. Jesse's volume abounds in similar anecdotes, it is needless to say that it is one of the most welcome which the present publishing season has produced.

New Plants.

39. Linum grandiflorum. *Desfontaines; aliàs* Linum splendidissimum *of some German gardens.*

A brilliant little annual, with large rich crimson flowers, lately introduced from Paris. It was originally found in heavy land near Masacara by Desfontaines, who called it species pulcherrima, as it certainly is. He described it as throwing up clusters of erect or decumbent stems, from 8 to 12 inches high, with smooth scattered leaves, of which the lowest are linear, the upper broader, narrowly lanceolate, and rough at the edge. The flowers are in loose panicles, with very large rose-coloured petals, about twice as broad as in the officinal Flax. The young plants which have been raised are found so unmanageable that the following remarks by M. Ysabeau, recording the experience gained about it in France, will be read with advantage:—"This pretty annual was figured in the 'Revue Horticole' of Nov. 1, 1848. The plant bears a profusion of flowers which remain long in bloom; it is consequently one which is greatly to be recommended. Since the above date it has been lost in most gardens, and, notwithstanding its splendid colour and other valuable qualities, it still is only in the hands of a small number of amateurs. Messrs. Courtois-Gérard and Vilmorin imagine that they have discovered the cause of the disappearance of a plant which was very favourably received at first. It was generally believed that it should be cultivated in pure peat, or at least in peat mixed with a little vegetable mould, or common garden earth. This soil appears to be too unsubstantial for a plant which, like other Linums, requires much vegetable nourishment; and this nourishment not being supplied in sufficient quantity, the plant did not ripen its seeds and eventually perished. Messrs. Courtois-Gérard and Vilmorin made the experiment of pricking some plants into the open ground, in a border of light but tolerably rich soil, containing much more nourishment than peat earth, either pure or mixed. This experiment succeeded perfectly. Although sown and pricked out somewhat late, the plants are at the present time (August 2) covered with flowers having well formed ovaries full of seeds, the perfect ripening of which does not appear doubtful, judging from the good state of the plants. It is probable that the cultivation of Linum grandiflorum failed from the excess of precautions taken to ensure its success; if the plant had been treated the same as other hardy annuals which are sown in beds or under glass, and pricked out into the borders, it would have perpetuated itself without difficulty. Now that it is in a manner re-introduced, it will be the duty of amateurs not to allow it to disappear again from the flower-garden, to which it is undoubtedly a valuable acquisition." *Journal of Hort. Society; Vol. IX.*

Among the devices of the day is the attempt to sell this under the name of *Linum splendidissimum, Vill.* Who is *Vill.?* no such abbreviation is known to botanists except that of *Villars*, who had no hand in the publication of the name. Can it possibly mean *Villain*, the seedsman at Erfurt?

FLORICULTURE.

Treatment of the Auricula.—This flower, although a favourite both with gardeners and amateurs, as well as with professional florists, is certainly not so extensively cultivated as it deserves to be. This may be owing to good varieties being still somewhat expensive to buy, or to beginners killing their plants through careless watering, over potting, or keeping them too closely housed up. The Auricula must have abundance of air, and be carefully watered, or it will not thrive. It is easily propagated by offsets or suckers, which should be taken off when sufficiently strong for the purpose, which is about potting season. If required, they should be stripped of their lower leaves, and then inserted in a well-drained pot or wide pan, filled with a mixture of leaf-mould, loam, and sand, and placed in a shady situation in a cool frame, or under a hand-glass, shaded from the mid-day sun, and cautiously watered. If not planted too thickly in the pans, they may remain in them until the general potting season has arrived, but they should be wintered along with the old-established plants. Potting should take place soon after the plants have gone out of bloom, although some prefer shifting their stock in August. At this shift the young plants as well as the old ones should be turned out of their pots, and the mould shaken from their roots, in order that they may be thoroughly examined, to see if the fibres are sound. Any roots that are growing too vigorously should be shortened, and all decayed or yellow leaves should be removed. In potting, bear in mind that the pots should be thoroughly drained, this being one of the most essential points in their culture; and if it is not attended to they will not flourish as they should do, and may even possibly prove a complete failure. The collar of the plants should be kept well up, in order that water may not lodge in the lower leaves, for, if not very skilfully watered, this often happens and the plants rot off. After the potting is finished, they may either be re-

moved into a frame for a few days, in order to get the mould thoroughly settled, or placed in their summer quarters, which should be under a north wall, and they should be set on a bed of coal-ashes, keeping a sharp look-out for slugs. If convenient, a temporary framing should be erected, in order that some protection might be thrown over them to screen them from heavy rains, and care must be taken to keep the offsets free from drip. They may remain in this situation until the end of October, and besides gathering seed, carefully watering, and in hot weather syringing them now and then, little else will be required until the end of October, when they should be removed to their winter quarters. A pigeon-holed brick pit will be found very suitable for them, as they delight in abundance of air, and should on no account be kept close, unless the frost is very severe. But little water will now be required, as the plants will be in a semi-dormant state; what they do have should therefore be given cautiously. About the end of February remove a portion of the old soil from the pots, top-dress them with a rich compost, and remove any early blossoms that may happen to have been thrown up. Keep also a sharp look-out for green fly. As spring advances, give them more air and water. As the truss grows, and previous to the pips expanding, remove those that are deformed or over crowded; sharp-pointed scissors will be found most suitable for the purpose, bearing in mind that the less they are handled the better; and at this stage of growth they should be slightly protected from the hot sun. While in blossom they may be removed to any shady and airy situation most suitable for prolonging their beauty; but care must be taken not to drop any water on them at this stage, or their blooms will be partially spoiled; they should also be protected from rough winds. The soil best suited for the culture of the Auricula is rich loam, rotten cow-dung, and river sand; these should be well mixed previous to use, and should be employed only when in a proper state. Manure-water, with occasional applications of soot-water, will be found beneficial during the growing and blooming season. As there have been given, a few weeks ago, excellent directions for sowing seed, I will omit that point, and merely say that as soon as the young seedlings appear, keep a sharp look-out for woodlice, which often prove very destructive to them. When the plants are sufficiently strong, plant them in boxes, or whatever may be most convenient, in good compost, thoroughly drained; they may remain there until they flower, when the best should be selected, and the remainder discarded. Many of the weaker plants will, doubtless, not flower until another season; but they should be kept, and receive good treatment, until they do bloom; the remainder of their treatment should be similar to that already recommended for established plants. The Alpines may be successfully cultivated in the open borders. *E. B.*

DAHLIAS: *A P.* The first shoots will probably be excessively robust, and may be destroyed, unless the variety is scarce; they seldom strike readily. Topping the shoot early will induce other breaks to follow quickly, which root rapidly and make the best stock. Keep your pot roots dormant as long as you can, say end of March; they will almost break naturally, and then be in time for turning out by the end of May.

PICOTEES: *Tyro.* Yellow ground varieties are generally acknowledged to be more tender than white ground kinds, but we do not find them to require more than common attention. The following will form a nice collection, viz., Conrad, Euphemia, Queen, Princess Alice, Royal Standard, Topaz, and William Clough; there is, however, more room for improvement in this than in any class of flowers that come under our notice.

RHODODENDRONS: *Anon.* R. coriaceum is one of the best white hardy Rhododendrons we have seen; album elegans is also very good.

TULIPS: *William D—s.* Do not protect your bed from cold weather. Nothing but frost will do any harm; guard, however, from wet, in case frost should follow.

Miscellaneous.

Wellingtonia.—A friend and correspondent residing at San José, writes to us as follows, in regard to this wonder of vegetation:—The hills opposite are covered with beautiful timber of Taxodium sempervirens, Pinus Benthamiana and Lambertiana, and at Santa Cruz, about seven miles distant, you would sit down and gaze upon them with admiration; but if you were to see the big Arbor Vitæ, now on exhibition at San Francisco, 30 feet in diameter, you would be perfectly amazed. When I went to see it, there were 20 people dancing in the hollow part, with chairs and sofas all round; I tried to get some seeds, but could not. I know some men who are going to cut wood in or near the locality, and will make arrangements with them to procure some. *Hovey's Magazine of Horticulture.*

Improvement in Hand-hoes.—By F. Huckvale, of Choice Hill, near Chipping Norton, Oxford. Patent granted June 22, 1853. (No. 1523.) The inventor describes and claims a method of constructing hand-hoes with two blades. *Mechanics' Magazine.*

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

CONSERVATORY, &c.—The weather for some time past having been very unfavourable for out-door operations, everything in the plant houses should, by this time, have received an extra cleaning, which even those who maintain the greatest order and neatness find to be occasionally necessary; and where not already completed, this kind of work should be pushed forward with the greatest possible despatch. It is highly beneficial to twiners growing in boxes or having limited root room to annually remove as much of the soil as can be done without greatly injuring their roots, replacing it with some good fresh turfy materials, and this cannot be done at a more suitable season than the present. The conservatory or show house should very soon be full of floral beauty. Camellias, Epacrises, Heaths, Primulas, Mignonette, tree Violets, Cinerarias, Daphne indica, and many other showy things may easily be had in bloom about this time, and a few Roses, Tulips, Hyacinths, and Narcissus will also be coming in, and will greatly assist in keeping the house gay. Where a mean temperature of 45° is maintained the house will, with a little management, be perfectly suitable for numbers of showy stove plants which bloom at this season. The greenhouse and hardier plants should occupy the cooler parts of the house, while such as may be introduced from the stove or forcing pit should be afforded the warmer positions, taking care not to place them near where air is admitted. By attending to trifling arrangements of this kind very much may be done to render the house suitable for the various kinds of plants in bloom. COLD PITS.—Take every advantage of mild weather to expose the stock kept in these to the external air, in order to prevent damping, and to keep them hardy. Remove all decaying leaves as they appear, and keep the plants as dry and cool as can be safely done. Attend to the directions given last week about propagation, and proceed vigorously in repairing losses and providing a sufficient stock for the supply of your wants at turning out time. Any plants infested with mildew, whether in the propagating pit or elsewhere, should be dusted with sulphur the moment this pest is perceived.

FORCING DEPARTMENT.

PINERY.—There is sometimes considerable difficulty in getting the plants to show fruit at this season, and where this is the case, advantage should be taken of the present mild weather to increase the temperature, which may be kept at from 70° to 75° by night, and from 80° to 85° by day. It will, however, be better to select as many of the most promising plants as it may be desirable to get to show fruit, and remove them to a compartment by themselves, than to subject a large portion of the stock to so high a temperature. Avoid syringing over-head plants showing fruit, as water when allowed to settle in the heart of the plant is apt to cause deformed fruit; keep the atmosphere moist, however. Look over the whole of the stock frequently, and see that it does not suffer for want of water at the root—giving tepid manure-water to such plants as are swelling their fruit. Maintain a steady bottom-heat, and in cases where tan is used, be careful, after renewing the bed, not to let the heat about the pots exceed 85°; more injury is done by too much bottom-heat than many growers suspect. VINERY.—In houses being started use means to get the buds to break regularly, and where necessary bend the Vines, raising the backward buds to the highest point; maintain a moist atmosphere, and sprinkle the Vines morning and afternoon. When the buds begin to break the night temperature may be increased a few degrees, but it should not exceed 55° until they are all fairly started, and 65° by day should not be exceeded except with sunshine and air. Rub off all superfluous buds, taking care to leave the stronger ones, but in cases where there is any fear about the show of fruit, it will be advisable to leave all promising buds until the bunches can be perceived. It is only in cases, however, where the Vines are in a bad state that there need be any fear about destroying all superfluous buds as soon as this can be done. Admit air on every mild day, using a sufficient amount of fire heat to maintain the proper temperature. Look well to the border, and see that it is protected from wet or sudden changes of weather; and, where fermenting materials are used, turn them as often as necessary, adding a small quantity of fresh leaves and dung, in order to maintain a steady heat. PEACH HOUSE.—Proceed cautiously with trees starting, maintaining a moist atmosphere until the blossoms expand, when a little more fire heat must be used during the day, in order to be able to give a freer circulation of air, which must be afforded on all possible occasions. See that the borders inside the house are in a moist healthy state, and, where this is not the case, give a liberal soaking with weak manure water, at a temperature of about 80° or 90°. STRAWBERRIES.—These should be allowed to have as much air as possible when ever the weather will permit, and care should be observed to keep the roots of such as are now being started in advance of the tops. The most suitable situation for Strawberries, until the blossoms appear, is a dung pit, where they will require very little attention beyond giving them air. The day temperature should not exceed 60° except with sunshine, and a very free circulation; and 50° will be sufficiently high at night.

HARDY FRUIT DEPARTMENT & KITCHEN GARDEN.

Proceed with digging and trenching until all vacant ground is turned over, but avoid this kind of work on stiff soils, when the ground is very wet. Where any fruit trees remain to be planted, get this done as soon as convenient; the present mild weather is very favourable for this kind of work, and it cannot be done too soon. It is worth while to be at the trouble and expense of properly preparing the ground intended to be planted with fruit trees, and particular care should be exercised to secure perfect drainage. Take advantage of every mild day to concentrate the greatest available force upon the nailing, and get this finished as soon as possible. Early Peas should be sown on a warm border at once, where not already done. Prepare a bed for early Potatoes, putting in the soil and let the heat settle before planting the Potatoes.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Jan. 19, 1854, as observed at the Horticultural Gardens.

Notices to Correspondents.

BACK NUMBERS; One Shilling will be given for the *Gardeners' Chronicle* of July 16, 1853.

BOOKS: *H J T.* The best practical book upon the management of forest trees, woods, &c., beyond all comparison, is "Brown's Forester," the last edition.—*P G.* "Pritchard on the Microscope," "Schacht" on the same subject, and "Microscopic Objects," an anonymous work, published by Whittaker.—*G Stev.* The new edition of "School Botany," now in the press, will contain a great number of illustrations not in the former edition, and a chapter of simple propositions explaining the first principles of vegetable physiology.

FRUIT TREES: *J M B.* You are too little acquainted with facts to be in a condition to criticise the Supplement to the Horticultural Society's Fruit Catalogue. Of Gooseberries, enough has been said for the present generation. In the Society's Transactions, 70 sorts are described; and in the last edition of the Catalogue, which, according to your own statement, you have not seen, upwards of 140 sorts are characterised. After all, the only sorts really worth growing are the good old English kinds. Fruiting a vast collection of Figs and Vines, so as to clear up the endless confusion that exists amongst them, is the work of a century, not of a few years, and requires an enormous quantity of glass. As to the Stanwick Nectarine, there is no proof that it will not succeed against a good south wall, in a fine season; and, in our opinion, the account given of it is sufficient. We deny that the Napoléon Pear tree is apt to canker; although, like other Pear trees, it may do so under unfavourable circumstances. With regard to other sorts of fruits, have you any idea of the number included in nurserymen's catalogues, English and foreign? It is more important to grow fruits of ascertained excellence, and to distribute them, than to be always occupying ground with pretended novelties. From ascertained trees, nurserymen and Fellows of the Society have been supplied with upwards of 30,000 labelled parcels of cuttings since the last edition of the Fruit Catalogue was published in 1842. The demand for them having diminished, arrangements have been made for increasing the means of proving satisfactorily the more important of those new and unknown kinds of fruits which are yearly introduced.

GARDENIA FORTUNI: *Col. M.* You will find full instructions respecting the culture of this plant, in an article by "Alpha," in the first Number of our volume for last year.‡

INSECTS: *Tyro.* It is only by great care and perseverance that these small species of scale insects (Coccidæ) can be got rid of. Washing the leaves with common oil, or turpentine and soft soap-suds, or gas-tar water, will be effectual; warm water, to 145°, may be also applied to the stems and woody parts. *W.*

OAKS: *Quercus.* There is no doubt that Q. sessiliflora and Q. pedunculata are distinct species. This is now admitted by the most experienced foresters, as it always has been practically by carpenters, who have fancied the wood of the former to be Chesnut, finding that it was not what they were accustomed to call Oak. The acorns of the first have sometimes long stalks, and the latter short ones; in other words, they are both disposed to lose the marks by which they are distinguished by mere closet botanists; but they are not the less distinct on that account. Even the people employed by Government in the New Forest (no good authority, indeed, as we must own) have been driven by the weight of evidence to admit the great importance of the distinction, as you will find in turning over the reports in the Blue Books.

PEACH TREES: *A S.* The Peach tree blossoms naturally at a cool period of the year, and a high temperature cannot be safely applied in the early stage of its vegetation. As you wish to have fruit early you may, when the trees are in flower, allow the temperature to be 50° at night and 65° in the day, or 70° by sun heat; but abundance of air must be admitted, and at the same time cold currents of it must be avoided.‖

PEARS: *S P.* The Crassane and Orange Bergamot will fruit against a west wall; but surely you would find a better sort, or one more deserving of a wall, than the Orange Bergamot.‖

PIGEONS' DUNG: *L L S.* Surely there is no decent work on manures which does not contain the information you seek. The substance in question is analogous to guano; but varies in quality with circumstances. If kept dry, and never allowed to ferment, it is far more powerful than if left to the accidents of weather and the consequences of accumulation. It should be used in the same manner as guano itself, which is nothing more than the droppings of sea birds *kept dry.* All such manures "burn;" and therefore require to be applied in wet weather, and largely mixed with inactive matter, such as peat, sand, dry vegetable mould, or whatever of a like nature can be most conveniently procured. It suits all crops which require strong manure. The pretence that such manures "breed weeds" is the most ignorant of notions. All strong manures encourage the growth of weeds, as they encourage the growth of a crop: and we dare say that slovenly cultivators find it more easy to keep in check half-starved weeds on half-run out land than rank weeds in rich soil. But it would not be a great stretch of intellect if they were to discover that keeping land regularly clean was the true mode of dealing with such a difficulty, instead of abusing manures.

THALIA: *M T M.* Next week.

VINES: *W A C.* Your Vines, from the specimen of wood received, appear to have been weakened from an attack of mildew, two or perhaps three years ago. But the preventive having latterly become well known, it is presumed that you have maintained a healthy foliage last year; and in that case you may expect your Vines to produce good wood in the ensuing season.‖

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

MANURES.—The following Manures are manufactured at Mr. LAWES' Factory, Deptford Creek:—

Turnip Manure	per ton	£7	0 0
Superphosphate of Lime	,,	7	0 0
Sulphuric Acid and Coprolites... ...	,,	5	0 0

Office, 69, King William Street, City, London.

N.B.—Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia.—Sulphate of Ammonia, &c.

PERUVIAN GUANO, the guaranteed import of Messrs. ANTONY GIBBS AND SONS, Lobos Island Guano, Superphosphate of Lime, and all Artificial Manures, Linseed and Rape Cakes, &c.—WM. INGLIS CARNE, 10, Mark Lane, London.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desirous of receiving instructions in Chemical Analysis and Assaying, will find ample facility and accommodation at the College.

PEAT MOSS CHARCOAL, AND OTHER MANURES.—The Undersigned are appointed sole Agents by the Peat Moss Charcoal Company, for the sale of this valuable fixer and distributor of ammoniacal matter.

Also on Sale, Peruvian Guano, Superphosphate of Lime, Gypsum, Nitrate of Soda, Bone-Dust, Sulphuric Acid, and all other Manures of known value.—Apply to MARK FOTHERGILL & Co., 204A, Upper Thames Street, London.

WARNER'S PATENT FARM AND COTTAGE PUMPS.

Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

	£	s.	d
Patent Pump	1	15	0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3	0	0

Larger sizes if required.

The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

JOHN WARNER & SONS,

8, CRESCENT, JEWIN STREET, LONDON.

Every description of Machinery for Raising Water; Fire Engines, &c.

An Illustrated Book sent on application post free.

PROTOXIDE ANTI-CORROSION PAINT, at a very considerable reduction of price. This article is extensively used by the principal Railway and Gas Companies, and by Builders and others for painting Stucco. It prevents iron from rusting, wood from decay, masonry from damp, and the hottest sun has no effect upon it.—Manufactured by CHARLES FRANCIS and SONS, Cement Works, Nine Elms, London.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

PRIZE CHURN.

ANTHONY'S PATENT AMERICAN.—The Royal Agricultural Society again awarded the prize to this Churn, at their last meeting at Gloucester; at the trial this Churn made 4 lbs. 6 oz. of butter from 4 quarts of cream, the best of the other Churns tried made only 3¾ lbs. from the same quantity and quality of cream; 2000 of these Churns are sold yearly. Copies of testimonials, and list of prices sent on application.—BURGESS & KEY, Agricultural Implement Warehouses, 103, Newgate Street, and 52, Little Britain, London.

WINTON'S PARKES' STEEL DIGGING FORKS.

I HEREBY GIVE NOTICE that the Steel Digging Forks hitherto sold by Messrs. Winton & Son, of Birmingham, and called by them "Winton's Parkes' Forks," were manufactured by me, or by my direction, for the said Messrs. Winton & Son, and that I have now discontinued to manufacture for them; and that I have appointed Messrs. BURGESS & KEY, of 103, Newgate Street, London my wholesale Agents, to whom I respectfully request orders to be addressed.

29th Sept., 1853. Signed, FRANCIS PARKES.

BAKER'S FOUNTAINS.
THE PHEASANTRY, BEAUFORT STREET, KING'S ROAD, CHELSEA.

MESSRS. BAKER can confidently recommend their FOUNTAINS for Poultry, Pheasants, Pigeons, &c., as the most simple, efficient, and economical; they are easily filled, no screw or plug required. Price, containing 4 quarts, 6s.; 9 quarts, 8s. And at 3, Half-moon Passage, Gracechurch Street.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

BAILY'S ROUP AND CONDITION PILLS FOR POULTRY.—This remedy has been extensively tried with uniform success, and is offered to amateurs and the public with the greatest confidence. It will effectually overcome that disease which has hitherto been the bane of the poultry-yard, and destroy that apprehension known to all poultry keepers, when a favourite and valuable fowl is seen to droop. It is inestimable for poultry returning from exhibitions, and greatly facilitates moulting.—Sold, with full instructions for use, in boxes containing 50 pills, by JOHN BAILY, 113, Mount Street, Grosvenor Square, price 3s. per box, or by post 3s. 4d. "Fowls, by Baily," the most useful and plainest treatise of the day; price 2s., by post 2s. 6d.

Baily's Registered Fountains, universally adopted and approved. Drawings and particulars, by post, on application.—113, Mount Street, Grosvenor Square.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1s. 6d. per yard run, of E. T. ARCHER, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey.

LAND DRAINAGE.

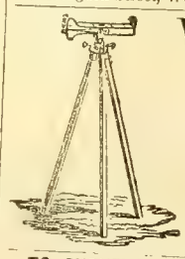
MR. BAILEY DENTON'S TABLES OF COST, &c., price 1s. 4d. Sold by METCHIM, Parliament Street.

MR. BAILEY DENTON'S WORKMAN'S A LEVEL, price 1l. 10s. Sold by JONES & Co., High Holborn, London.

LAND DRAINAGE.

MR. JOHNSON begs to inform Landowners, Agents, &c., that he is prepared to undertake the Drainage of Land, either by Contract or by a small charge per acre for planning and setting out the Drains, taking Levels, superintending the Work, &c.

Mr. J. has been for several years constantly employed as a Drainer in most of the Counties in England, and can give numerous satisfactory references. Plans for Tilery Buildings, and every information on Drainage can be obtained at the Office, 12, Abingdon Street, Westminster.

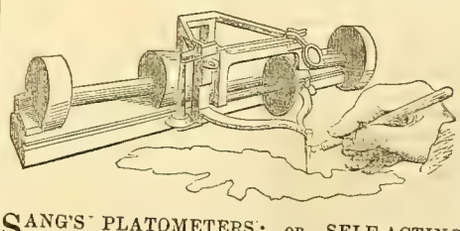


WEIR'S DRAINING LEVEL,
PRICE 30s.

These Draining Levels have lately been greatly improved; they have stood the test of five years' use, during which upwards of 1000 of them have been sold. They are so simple that any labourer who can read can use them. They require no graduated staff, the index telling at once the rise and fall in inches without any computation.

EDWARD WEIR, Agricultural Engineer, 16, Bath Place, New Road, (6 Doors West of the Hampstead Road), Removed from Oxford Street.

TO SURVEYORS, ARCHITECTS, & ENGINEERS.



SANG'S PLATOMETERS; OR, SELF-ACTING CALCULATORS.—These Instruments tell accurately the contents of figures drawn on Maps. They effect a great saving of time and labour, as in order to find the area it is only necessary to lead a tracer round the outline of the figure, however irregular it may be. Price 10l. each. Sold by JOHN SANG, Kirkaldy.

TO LANDOWNERS, SOLICITORS, ESTATE AGENTS, ETC.

THE LANDS IMPROVEMENT COMPANY, incorporated by special Act of Parliament, 1853, having perfected their organisation, are prepared to receive applications for the execution of improvements, under the provisions of their Act.

The Act extends to England, Wales, and Scotland; and empowers persons in the actual possession of lands, or in receipt of the rents, such as tenants for life, trustees, bodies corporate, incumbents of benefices, mortgagees in possession, guardians of infants, &c., to effect substantial improvements on their estates, and to convert the outlay on such improvements into a terminable annuity or rent-charge of from 14 to 25 years, at will.

The Company, acting under the supervision of the Inclosure Commissioners, will undertake and execute improvements, or will supply the capital to landowners preferring to execute improvements themselves, or will grant the powers of their Act to landowners seeking merely to charge the inheritance with the outlay on improvements from their own funds.

The Agricultural Works of Improvement particularly specified in the Company's Act, are:—

1. The Drainage of any Lands by any such means as the Inclosure Commissioners shall approve.
2. Irrigation, and Warping of Lands.
3. Embanking of Land from the Sea, or Tidal Waters, or Rivers, in a permanent manner.
4. Enclosing or Improving the Drains, Streams, or Watercourses of the Land, under the Inclosure Commissioners.
5. Reclamation of Land lying waste.
6. Making Farm-roads to the extent of one-half of the outlay for such roads.
7. Clearing Lands.
8. Erection of Farm-houses, and other Buildings required for farm purposes to the extent of three-fourths of the outlay for such Farm-houses and other Buildings.

In effecting the above Improvements there may be erected any Engines, Machinery, Engine-houses, Mills, Kilns, Sheds, Yards, Shafts, Tanks, and Reservoirs, Pipes, Conduits, and Watercourses for Irrigation, Tram-roads and other ways, Bridges, Weirs, Sluices, Flood-gates, and Hatches.

For Forms of Application and further Information apply to the Hon. W. NAPIER, Managing Director, 2, Old Palace Yard, Westminster, London.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

PATRON—His Royal Highness PRINCE ALBERT.
PRESIDENT OF COUNCIL—Earl BATHURST.
PRINCIPAL—Rev. J. S. HAYGARTH, M.A.

PROFESSORS, &c.

Chemistry—J. A. C. Voelcker, Ph.D., F.C.S.
Geology, Zoology, and Botany—James Buckman, F.G.S., F.L.S.
Veterinary Medicine and Surgery—G. T. Brown, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. Armstrong, C.E.
Manager of Farm—G. Austin.
Assistant to Chemical Professor—A. Williams, M.R.C.S.

The first Session of 1854 will commence early in February. The annual fees for Boarders vary from 45 to 80 guineas, according to age and other circumstances. The Fee for Out-Students is 40l. per annum. The College Course of Lectures and Practical Instruction is complete in one twelvemonth—though a longer time is recommended. There is a department for general as well as for agricultural purposes. Prospectuses and information can be had on application to the Principal.

The GUIDE TO THE ROYAL AGRICULTURAL COLLEGE FARM may be obtained of HAMILTON, ADAMS, & Co., Paternoster Row, London; and EDWIN BAILY, Cirencester. Price 1s.

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL AND GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.

Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

The Agricultural Gazette.

SATURDAY, JANUARY 21, 1854.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

THURSDAY, Jan. 26—Agricultural Imp. Society of Ireland.
WEDNESDAY, Feb. 1—Agricultural Society of England.
THURSDAY, — 2—Agricultural Imp. Society of Ireland.

WHATEVER may be the value of any one of the reports on THE AGRICULTURAL STATISTICS OF IRELAND, which are annually published—the facts being obtained, we believe, through the agency of the constabulary force—there can be no doubt of their usefulness, considered as a series. Any inaccuracy which may be inseparable from the mode of their preparation must affect all alike, and therefore, for purposes of comparison, and in order to ascertain the direction and amount of agricultural progress, they may be safely trusted. All our Irish contemporaries are just now engaged in stating and discussing the facts brought out by the lately published returns of Irish agricultural produce for 1852; and a most important set of truths they tell, indicating generally, we think, a satisfactory state of things. They tell of a decrease in the number of small holdings, nearly 20,000 of such holdings under 30 acres having during the previous year been amalgamated, so that the increase in holdings above 50 acres is 2332. And it is satisfactory to think that this is a process which, however necessary it may be considered, has not been effected as hitherto at the expense of great suffering amongst a cottier population. The exodus of small farmers sufficiently accounts for the disappearance of the small farms. The process has been effected with benefit to those who have gone, and with ultimate benefit to those whom they have left behind.

The next great fact indicated in these returns is that the extent of land in Grass is on the increase; and though this, perhaps, is not to be considered a mark of progress, yet there is a bright side here also. If there were in 1852 100,000 acres of land less in grain and pulse crops than there were in 1851, yet, the gross produce from the smaller extent was nearly 16,000 tons greater than from the larger extent. This, we are told, is to be accounted for, chiefly from the larger extent of the Oat crop with its heavier acreable produce; but also from the larger produce generally, from a favourable season, and also no doubt from improved management.

The extent in green crops and their produce does not present so favourable an appearance.

"The extent of land under Potatoes in 1852 exceeded that in 1851 by 8031 acres; but, notwithstanding this increase of cultivation, the produce was less by 1,645,279 barrels. There was also a reduction in the produce of Turnips, amounting to 405,429 tons; in Parsnips, of 676 tons; in Vetches, 7182 tons; and in Rape, 5612 barrels; but in these latter cases that result arose from their diminished cultivation. Mangold Wurzel shows an increase of 90,904 tons; Cabbage, of 3058 tons; Beet-root, of 1350 tons; Carrots, 17,781 tons; and Flax, of 256,228 stones."

But here, too, we can see degrees of increased energy and enterprise. The increase in produce of Mangold Wurzel and Flax indicates the growth of manufacturing as well as the activity of agricultural industry.

A great deal of very interesting information is given on the cattle population, and its distribution amongst different orders of occupiers. The increase is very considerable, especially, we are glad to see, in sheep; and it is worthy of note that, while the

number of small occupiers is diminishing, the gross wealth in this kind of property of the smaller number is much greater than the gross wealth of the greater number used to be.

Altogether, the returns tell a most satisfactory tale of Irish agricultural progress; and while they may not furnish positive truth, or indicate with accuracy the stage at which, in that progress, Irish agriculture has arrived—yet, as we have said, the nature and rapidity of that progress may be safely and satisfactorily gathered from them.

HAVING commenced a series of articles last spring upon the important topic of ARTERIAL, or "TRUNK" DRAINAGE (as Mr. PUSEY, considering the true office of "arteries," will have it called), we again renew our endeavours to convey information which is perhaps not very easily attainable. Indeed, the discussion already excited* and gaining ground upon this matter, urges us once more to our task; now that storms of thickly drifted snow, all of which will have to melt, may be setting some minds upon the thought—where will this downfall find its exit? and are the channels along which it will run also capable of carrying away the heaviest outpouring of water-torrents which those blustering and blazing weather-divinities, old Æolus and Sol, can unitedly collect into clouds? Such an inquiry will of course occasion little anxiety to the man whose land rests aloft upon dry chalk rock, fissured limestone, or absorbing sandstone, which suck away his drain-water, often to issue it again in wet springs under, over, and within unfortunately neighbouring soils in the valleys; but to the great proportion of farmers who are not so comfortably sited, and whose indefatigable pipe-layings and subsoil-ploughings perform during several months in the year only half the good effects they ought—this question becomes of great consideration, and awakens some concern.

It is a prevalent error that the principles of drainage are to be applied on a great scale only in districts artificially reclaimed; but scarcely to be followed out in regard to streams that Nature herself is supposed to have provided for what is neither transformed lake nor estuary, but immemorially dry land. Cut new channels or divert old ones, if you please, upon ground newly won from the waters, and imitate imperfectly upon your fens and marshes the rivers which form your models on the world's self-made, self-drained surface; but beware how you touch natural water-courses, or attempt the artist's absurdity of "improving Nature." Here are wanted no new works, but only repairs.

Now, we admit that the engineer has far less to perform upon the latter than on the former order of land, but maintain that the difference is only in degree. Works of the same *kind* are required; one system of drainage, rules and principles, applies to both; and the methods proved successful upon the one are those which should be adopted in improving the other; of course omitting such as are merely incidental to the locality. Hence we regard our lowland districts, where embankment and drainage, by gravitation or machinery, in natural or made channels, have been pursued by all varieties of means, in all times, under all difficulties, with more of success than failure, as the best schools for instruction respecting our forthcoming operations in arterial drainage. We say that "upland" and "level" drainage must both be conducted upon the same principles; only that more labour is required on the latter than on the former ground. In the latter case we have the rivers to cut—in the former they flow ready to our hands; but these main-drains, when once in existence, may evidently be maintained and improved by applying one set of rules, quite irrespective of their different origin.

If man, not content with the land already available, will adventurously usurp the dominion of the waves, he must both defend his conquest and expel alien waters; if he will seize for his occupation a bay into which Nature empties her highland drainage, he must not only lay dry its bottom, but also carry forward the floods to the ocean which he has pushed off from its former margin. Our enclosed deltas and marshes are all held under this responsibility. Again, if man will draw off the volume of water naturally caught in some inland lake or basin, for the sake of tilling its hollow bed, he must sustain the charge of permanently baling out the inflowing rivulets and springs—by steam pumps, as in the case of "Whittlesea Mere," or by syphon or tunnel, as now exampled in Scotland.

In the same way with regard to ground which has not been previously submerged: Nature does certainly provide a sufficient drainage *for her own crops;* she dries the soil enough for her copse, moss, Reed, and Osier; but if we choose to cultivate choicer vegetation, we have not only to disburden the land of the wild growth encumbering it, but also to furnish it with extra facilities for dryness and warmth suited to its now artificial condition. The same thing has to be done either upon old or reclaimed land; only that the latter requires the larger amount of outlay and exertion.

The cultivable surface of our country may therefore be divided simply into two classes, one comprising the elevations and dry subsoiled tracts, which, like well-sloped roofs, shoot off descending rains; the other embracing the far more spacious areas, most of which, like eave-gutters, catch and convey away this water in addition to that which they independently receive, while some (as the fens) more resemble pump-dried tanks and cisterns into which the spouts discharge themselves. The same hydraulic laws applying to pipes and gutters as to vats and reservoirs, whoever has dried a well may safely set his wits at a water-trough, and in like reason may the great engineers who have desiccated our fen flats be entrusted to devise simple means for the complete trunk draining of all the land needing it. But though we are careful to dislodge birds' nests from eave spouts, and stop leakages that might spill the current short of its appointed tub, we have yet to scour out the main streams in all parts of our country, to clear away fords and shoals, weirs and mill-wheels, locks and pinching bridges, to side-up fallen banks, and dredge out bars of sediment, not to speak of sedges and water-weeds innumerable (scarcely yet including the dreaded new "water thyme") which we still allow to perpetrate garotte robbery in our brooks and ditches.

Our first series of articles promised our readers to notice briefly the principles on which our fenmen and those of other countries have proceeded in their works of general drainage, together with some information upon the subject of steam drainage. Our future communications will therefore run in this direction. *I. A. C.*

IT is very common to refer the MILDNESS of our WINTERS to the effects of the Gulf Stream, which is well known to issue from the Gulf of Mexico through the narrow strait of Florida. This vast current of warm water, after running along nearly the entire seaboard of the United States of America, afterwards spreads out and takes a northerly and easterly direction, and is supposed to impinge upon the west coasts of Britain and Norway. That the Gulf Stream has a certain amount of influence on the character of the climate of Britain we do not doubt, but at the same time we consider it is usually very much overrated, and not a little misapprehension exists in regard to its exact influence. We thought the President of the British Association, in his inaugural address at Hull, gave an undue preponderance to the effects of the Gulf Stream on the climate of western Europe, while he overlooked other elements which are more general and important in their operation.

For some weeks before and after Christmas 1852, the mean temperature was from 5° to 8° above the mean for the season. The early part of the winter was mild and rainy, in short we had the temperature of April with great floods. But what an extraordinary contrast have we in 1853-4. The mean temperature of the week ending 15th ult. was 5° below the average of the season, the weeks ending 22d, 29th ult., and 5th inst. were 7½, 10¾, and 9½ degrees respectively below the average. Our rivers, from the Thames to the Tay, have been more ice-bound in December than they have been in any year since 1838. Less rain has fallen in London last month than has fallen in the same month for nearly a quarter of a century.

What, then, is the cause of this great variation in the temperature of this season and that of last year? Can we for a moment suppose that it is owing to any difference in the temperature of the narrow stream which issues from the Gulf of Mexico, and which is supposed to spread its waters over the wide bosom of the Atlantic, and to be the prime agent in imparting warmth to the whole ocean which washes the western coast of Europe? We think it is very questionable whether the Gulf Stream is the cause of the high temperature of the sea even around the British Isles; for our ideas in regard to the effects of terrestrial radiation would require to be greatly modified to explain the retention of heat in a fluid after having been spread out in so thin a stratum over so great a surface. There are other causes, however, in operation, to which we must ascribe the high temperature of the Atlantic in our latitude, and which impart the curious curves to the monthly isothermal lines of winter.

If the mere proximity of a warm current of water to any country should have much influence on its winter temperature, the eastern states of North America should have very warm winters; but the isothermal line which runs over the British islands in January, descends as low as latitude 37° in America, where the temperature of the Gulf Stream not far from the coast is 20° higher than that of the sea of our own shores. If an easterly current of wind had constantly prevailed on the east coast of America, then the adjoining states would have had very warm winters; but as DOVE has justly remarked, the N.W. winds in the United States and Canada are the cause of the low course of the isothermal lines of the winter months in that part of the American continent. The influence of the Gulf Stream is thus scarcely felt in raising the mean temperature of those coasts, but the changes in the direction of the wind often causes a difference of more than 60° within 24 hours in the winter months. The absence of regular tracts of east winds in winter, allows the great accumulation of ice and snow to take place on the Labrador coast and in Baffin's Bay.

In the eastern Atlantic, S.W. winds are far more prevalent than any other; whenever they blow for any length of time they cause slight surface currents of water to flow in the same direction. Coming from a lower latitude they tend to warm and to keep warm the space over which they travel. It is the S.W. winds which retain the heat in the waters over the supposed course of the Gulf Stream, and which cause the high winter temperatures over western Europe. This much is certain, that where the S.W. winds are not felt, the influence of the Gulf Stream is not felt. The vapour which these winds contain is a reservoir of heat which imparts to them their genial influence; when they are robbed of this element their heat-carrying power is gone. When they prevail on the coast of Norway the winters are rendered very mild, but in rising over the high ridge of mountains they lose their moisture, and Sweden experiences all the rigours of a continental winter.

The mild winters of the British islands are always the result of a continuance of S.W. winds, which rarely blow in any part of Britain more than a few hours without raising the temperature above the freezing point. The most formidable collection of snow soon vanishes on hill and dale when a strong current sets in from the southern Atlantic. On the other hand, northern and eastern currents of wind give us hard winters by bringing air cooled down by ice and snow, and the influence of the Atlantic is then little felt. The low temperature of last month has arisen from the steady current that has flowed from the continent of Europe, a little modified by its short passage across the German ocean; had east winds been at all common at this period of the year, our winters would be much more severe than they commonly are, and we should have heard much less regarding the influence of the Gulf Stream.

The S.E., E., and N.E. winds which prevailed during the last month were of a very peculiar character. They have been quite different in their

---

* We refer especially to a very instructive letter, lately published, addressed by Mr. BAILEY DENTON to Mr. PUSEY, in which the evils of the present system of reversing the proper order of operations are powerfully set forth. Mr. DENTON contends that it will lead only to delay and failure to attempt at once the improvement of mill-streams and main rivers; and that the best plan now will be to carry out the remedial work by continuing the reverse order in which we have begun. "It is with the minor tributary streams we should now deal; those water-courses on which no mills exist, and with which no peculiar water interests are connected, but which are nevertheless the arterial receivers and water-ways of the drainage and surface waters of the higher lands." The following, then, is Mr. DENTON's suggestion:—"By far the larger proportion of the corn lands of this kingdom are the higher lands, and are so situate that the minor arteries and outfall ditches receiving the surface and drainage waters are to the mill-streams what the ordinary highways and by-ways are to the turnpike-roads; and there is no reason why some general measure should not place these important but inferior water-ways under some central jurisdiction, represented by district officers, whose duty it shall be to examine the state and efficiency of any water-course (not affecting mills and water-rights), at the bidding of any landowner, prejudiced by the neglect of another, and thereupon report the same to the central authorities, who shall direct, after notices have been given and objections heard, such works of cleansing, scouring, widening, deepening, and straightening, to be executed as they may think proper, with funds raised by their orders on the landowners, in shares proportionate to the properties benefited by the works. As the law now stands (10 & 11 Vict., cap. 38, sec. 14, et seq.), the necessity of giving formal and legal notices—the uncertainty and delay of obtaining a warrant from two justices n petty sessions—the personal annoyance of appearing as an opponent to a neighbour who, peradventure, may be a magistrate himself—the disagreeable process of levying a distress for costs and expenses—and sundry other invidious discomforts and troubles attending the Act—render it practically nugatory. And, after all, the Act contemplates merely the cleansing and scouring of existing ditches; no provision is made for widening, deepening, and straightening such as are shallow and tortuous, without which it is waste of money to interfere with them. By the appointment of a district public officer (who, in fact, would act as public prosecutor as well as engineer for the district), all such objections will be avoided. In the Inclosure Commissioners there already exists a central and competent board of appeal and jurisdiction; and it will not be difficult to find active and competent engineers who will perform the local duties intrusted to them creditably to the country and to themselves. As one greatly interested in the subject of general drainage, and engaged in various works, I can confidently say that if such powers as I have suggested were placed in the hands of the Inclosure Commissioners, to be carried into effect by the district officers, not only would the under-draining of the country be better executed, but a great number of minor valleys of great fertility, and comprising a vast number of acres of land, would be rendered free from floods, and capable of under-draining, to the increased productiveness of the soil, and the improved healthiness of numerous districts." We add to this a reference to an instance in illustration of Mr. DENTON's remarks, contained in a report to the Cirencester Farmers' Club, which we shall soon publish.

nature from similar winds that sometimes are common at this season of the year. It is curious that our meteorological observers have not drawn any distinction between the two classes. During last month these winds came to us as an undivided current; we have had nothing resembling them since January, 1838. The great proportion of the east winds which blow on the east coast of Britain have an overlying current from the S.W., and are usually rainy with a low barometer. The winds of last month, however, not only flowed from the east on the surface of the ground, but the currents in the higher strata were from the same quarter, and the barometer has showed great pressure; when this last state of matters exists very little rain or snow falls—it seldom falls continuously for any length of time, but only in showers which succeed each other at pretty regular intervals.

The cold weather, however, seems to have been sooner and more severely established in the southern part of the kingdom than in the northern. This circumstance has probably arisen from the greater extent of surface of water which the east wind had to travel over before it reached the Scottish coast. The lowest temperature at Chiswick has been 4°, but 11° seems to have been the minimum in the middle districts of Scotland. Two remarkable snow storms have occurred, one in the south and middle districts of England, the other in the north-east of Scotland, which suspended railway traffic for a time, and have caused much loss to our shipping on the east coasts. Little snow has apparently fallen between the Grampians and Lammermuirs. We shall reserve the details of these storms for another article, and review some of the opinions of Professor Dove, of Berlin, in regard to the atmospheric currents of the high latitudes of the northern hemisphere. *R.*

THE MANAGEMENT OF MANURE.

Should Farm-yard Manure be Applied Prior to or After Decomposition?

The new "Cyclopedia of Agriculture," now in course of publication by Blackie & Son, is, in my judgment, by far the most important and useful contribution hitherto made to the agricultural library. In truth, to the farmer, it supersedes the necessity of (I may say) encumbering himself with other works, as it embraces the entire field of Practice and Science connected with agriculture, according to the latest and best authorities; and excludes much matter, to be found in earlier treatises, which carefully-conducted practical experiments, and the application of science in later times, have taught us to reject as founded in error. Such is the impression I have formed after reading the whole of the 24 parts which have been delivered to subscribers, so far as they relate strictly to the science and practice of agriculture.

It could not be expected that a work produced by numerous contributors should exhibit a consistent whole, like the effort of a single mind; and I will, with your permission, point out that which appears to me to be an inconsistency in the article "Manure," because it involves a very material consideration, not only in the manufacture and application of this very important article, but as to the comparative values of fresh and decomposed farm-yard manure, on which the practice and opinion of agriculturists differ materially. For the present purpose I would exclude what may be called the mere mechanical effect (such as the choice of long fresh manure to be ploughed in on heavy land), with the view of eliciting the opinion of scientific men to the chemical illustration of the question.

At page 338 (No. 18) is the following paragraph, "It will be observed that it is chiefly the proportion of water which is subject to the greatest variations, and that well-fermented or perfectly-decomposed manure contains much more nitrogen than fresh; for which reasons its effects on vegetation are much more immediate and energetic than those produced by applying fresh farm-yard manure to the land." In page 343 it is stated, "By far the most valuable constituent of farm-yard manure we have seen is ammonia, which, being very volatile, is continually given off from fermenting dung-heaps, and consequently lost to the farmer. It is clear that the longer the process of fermentation is carried on in the heap, the greater the loss of this valuable fertiliser will become; for which reasons care is taken by intelligent farmers to stop the process of fermentation before all the nitrogen of the manure is converted into ammonia, and to retain the latter in the heap." Then, after showing the loss in weight and bulk of manure during fermentation, the article proceeds: "This loss not only affects the water and other less valuable constituents of farm-yard manure, but also its most fertilising ingredient, nitrogen. Chemical analysis has shown that 100 cwts. of common farm-yard manure contain about 40 lbs. of nitrogen; and that during fermentation, in the first period, 5 lbs. of nitrogen are dissipated in the form of the volatile ammonia; in the second, 10 lbs; in the third, 20 lbs. Completely decomposed common manure has thus lost about one-half of its most valuable constituents" (all the nitrogen).

Now, if this be so, it is perfectly clear that well fermented and perfectly decomposed manure cannot contain any nitrogen at all, the whole having been disposed of in the three stages of decomposition in the form of ammonia, which is quite at variance with the reason given in the foregoing extract from page 338.

It has been suggested to me that the author meant to convey this fact—"that a ton of well fermented or perfectly decomposed manure contained more ammonia (not nitrogen) than a ton of fresh manure, so that, equal weights being taken, the former would be more energetic in its immediate action than the latter." This does not, however, resolve the difficulty; for, according to the subsequent paragraph, the whole of the nitrogen, the source of the ammonia, will have been disposed of in the last stage of decomposition.

My own impression is, that decomposition of all farm-yard manure ought to go on in the land, which at once absorbs all the results of such decomposing material for vegetable nutrition; and that no decomposition ought to be permitted elsewhere—that whenever the state of the land, the season, and other circumstances admit of it, it should be placed (prior to decomposition commencing) on the land and covered in; and when an accumulation cannot be so disposed of, it should be put in a heap and carefully covered at all points with earth. When that has been done effectually, I have found the manure, when carted out many months afterwards, substantially in the same state in which it was when placed in the heap—simply consolidated by its own pressure, but not decomposed.

On reading the portions of this article to which I have hitherto referred, I began to doubt whether my practice was based on so sound a foundation as I had supposed; but, on arriving at the close, I was pleased to find it thus confirmed: "The practical deduction which appears to be warranted by these experiments is, where possible, to apply farm-yard manure in a fresh state to the land. By ploughing in fresh dung, all the volatile matters—which are slowly given off during the fermentation that continues for some time in the soil—are absorbed by the soil, as well as the soluble salts, which are so easily washed out by the rain falling upon manure kept long in heaps." *C. L., Cirencester.*

TITHE COMMUTATION.

As your readers may feel anxious to know the result of the corn averages for the seven years to Christmas last, published in the *London Gazette* of Jan. 7, viz.:—

Wheat	...	...	6*s.* 0*d.*	per imperial bushel
Oats	...	...	2 6¼	"
Barley	...	...	3 9½	"

I beg to state for their information that each 100*l.* of tithe rent charge will, for the year 1854, amount to 90*l.* 19*s.* 5*d.*, which is a reduction of nearly three quarters per cent. from last year's value.

The following statement from my "Annual Tithe Commutation Tables" will show the worth of 100*l.* of tithe-rent charge for each year, since the passing of the Tithe Commutation Act, viz.:—

	£	*s.*	*d.*
For the year 1837	98	13	9¾
" 1838	97	7	11
" 1839	95	7	9
" 1840	98	15	9¼
" 1841	102	12	5¼
" 1842	105	8	2¾
" 1843	105	12	2¼
" 1844	104	3	5¼
" 1845	103	17	11¼
" 1846	102	17	8¼
" 1847	99	18	10¼
" 1848	102	1	0
" 1849	100	3	7¾
" 1850	98	16	10
" 1851	96	11	4¾
" 1852	93	16	11¼
" 1853	91	13	5¾
" 1854	90	19	5
	£1788	18	9½
General average for 18 years	£99	7	8½

NOTES OF EXPERIMENTS IN THE BOTANICAL GARDEN OF THE ROYAL AGRICULTURAL COLLEGE.

By J. Buckman, F.G.S., F.L.S., Prof. of Geology & Botany.

The botanical garden of the College comprises about 3 acres of ground, which a few years since was inclosed from one of the highest and most exposed fields of the farm, its situation near the house having decided its choice; it is a long patch of ground, with its length from south to north, and merely walled in with a dry freestone wall, from which data it will at once be seen that there can be no reason for supposing it a garden of the first class.

The subsoil for the most part is a thin bed of clay resting upon the freestone of the great or Bath oolite; however, at the north-east corner the brash comes near to the surface, and on this are now planted about 50 species of Conifers, whilst the north end is laid out with turf, dotted here and there with such forest trees as may be calculated to afford subjects of interest in teaching the students, and at the same time act as a shelter from the colder winds.

The rest of the ground is divided into two parts, one of which is devoted to the growth of such esculent vegetables as are calculated to be useful in a large community like that of the college, the object aimed at being to get a constant supply in succession without reference to curious or rare sorts, or of early growths, for which the garden is ill-suited. Of course fruit trees of all kinds are excluded, as the larger trees, such as Apples and Pears, never thrive so near the rock, and more especially in exposed situations, and small fruits would stand but little chance with so many botanical students constantly examining their structure.

The other portion of the garden is devoted more particularly to exhibition of examples of agricultural crops or to experiments of agricultural value; and here perhaps the very fact that the soil is hardly so good as the average of the farm renders this much better for our purpose, as in the endeavour to ascertain the capabilities of a plant for field cultivation, it seems hardly wise to draw conclusions from garden culture; and again where the crops obtained are subjected to chemical examination, as many of them have been by Dr. Voelcker, the college professor of chemistry, the derived facts are of more value to the farmer when obtained from the analyses of crops grown under ordinary rather than extraordinary circumstances either of soil or cultivation.

This portion of the garden, which is yet only in progress towards completion, is divided into square plots, a few of which contain five square yards, whilst the generality of them are 2½ yards square; these vary more or less in their crops each season; at the present moment there are 64 plots in cultivation, the crops of which may conveniently be ranged under the following heads—1st, plants suitable for green food, 28 species; 2d, British pasture Grasses, 24 do.; 3d, plants for economic uses, 8 do.; 4th, medicinal plants, 4 do.; total, 64. Of the green food plants 22 plots are occupied with the Leguminosæ, the remainder being various; the following is the list of leguminous green food plants:—

1. Ervum lens, Lentils.
2. Lathyrus aphaca, Yellow Vetchling.
3. Lathyrus pratensis, Meadow ditto.
4. Lathyrus sylvestris, Narrow-leaved Everlasting Pea.
5. Medicago lupulina, Black Medick.
6. Medicago sativa, Lucerne.
7. Melilotus leucantha (two plots), White Melilot.
8. Melilotus officinalis, yellow ditto.
9. Trifolium filiforme, Lesser Trefoil.
10. Trifolium hybridum, Alsike Clover.
11. Trifolium incarnatum, Annual Clover.
12. Trifolium pratense, Broad Clover.
13. Trifolium medium, Zigzag Clover.
14. Trifolium repens, White Clover.
15. Ulex Europæus, Furze.
16. Vicia cracca, Cow Vetch.
17. " sativa, common ditto.
18. " sepium, Bush ditto.
19. " angustifolium, Narrow-leaved ditto.
20. Onobrychis sativa, Saintfoin.
21. Onobrychis sativa, var. bifera, Giant ditto.

Of these it will only be necessary to make the remark that they generally grow very well. The seeds for the most part were obtained from Mr. Gibbs, the seedsman to the Royal Agricultural Society. Other remarks will apply to special experiments. The three species of Lathyrus were brought into the garden in order to point out the important structural facts in connection with their leaves, stipules, and tendrils, and at the same time to observe the amount of herbage they were capable of yielding. The first, L. aphaca, grows much more luxuriantly than in a wild state, and it is curious to see the great quantity of herbage produced from a single root of a plant which after a few weeks' growth does not put forth a single true leaf, the leaves in reality being metamorphosed into tendrils, and the stipules therefore grow to an extraordinary extent, as they have to perform the leaf function.

As an agricultural plant, it is not likely to be of much value, as there is great difficulty in getting the seeds to germinate; indeed, this is the case with all the three species experimented upon, and notwithstanding Hooker describes it as an annual, it is nevertheless two years in perfecting its full size, when it seeds readily, and then dies.

The L. pratensis does not succeed with us, its herbage is scanty, and it does not perfect its seed. The L. sylvestris was sown in the autumn of 1852, and is now covering a plot with an abundance of luxuriant foliage; this is a perennial species, which if it will bear cutting is likely to be a very useful plant.

With respect to the Medicks it is only necessary to remark that my experiments fully confirm the general regard for their value. It seems curious that the Medicago lupulina should be called Hop Trefoil by the farmer, whilst the Trifolium procumbens is the Hop Trefoil of the botanist; the two plants are very different in habit; the former does not necessarily die on being cut down, indeed its habit is to seed well before withering, whilst the latter is a decided annual; it may further be noted that the former prefers better soil, whilst the latter gets on well in poor sands, and is deficient in nutritive properties.

In 1850 I had two sets of seeds sent me, one of which was said to be that of a Cabool, the other of a Bokhara Clover; I find them both to be Melilotus leucantha; they both grow a large quantity of herbage, which will allow of being cropped twice or thrice in the year, under which treatment it may be made to assume a perennial growth, but when once it has seeded it then dies; the same may be said of the M. officinalis. These plants in the tender state are greedily eaten by cattle, notwithstanding they have a bitter aromatic taste. In drying they exhale the smell of newly made meadow hay, and no doubt contain the same aromatic principle as Anthoxanthum odoratum (the Sweet Vernal Grass). Now, is it not probable that the superiority of meadow hay over artificial hay may be due to this flavouring matter as it occurs in some few meadow Grasses? It is well known that vapid food disagrees with most people; I recollect that Soyer's soup for the poor was considered highly nutritious, though at much less cost than that usually made, which latter was rejected, as it disordered the stomach, but Soyer knew how to give it flavour, which made all the difference, not only in taste but in its effects; by the way, it may be noticed that, as a rule, our peasantry dislike stews, which they call messes, and the manner in which this is pronounced by a countryman

testifies his disgust at them—it is the same thing, John Bull is no *artiste*, his stews want the flavour. Now, to bring this to bear on our subject, would it not be worth while to mix a small quantity of Melilotus seed with "Seeds and Clovers?" This would give the hay the rich scent and flavour of meadow hay, and besides being a luxuriant growing plant of itself, it would, from its upright growth, tend to draw up its neighbours.

For the purpose of experiment in this matter, I should recommend trial to be made of the M. officinalis, as it is not so woody as those mentioned; my plot was sown last autumn, and it is now in rich foliage, about 18 inches high, from which I conclude that it may be sown with the Barley crop as usual with seeds; it will bear cutting as well as the Clover, and if prevented seeding will last equally long.

This plant has not yet been analysed, but from the result of analyses of the M. leucantha, as described by Dr. Voelcker, in the Journal of the Highland and Agricultural Society of Scotland, for July 1853, we are led to infer that the M. officinalis may rank high as a feeding substance.

The following is the composition of M. leucantha, arranged according to the two great classes of alimentary substances:—

	In Natural State.	Dried at 212° Fahr.
Water	81.300	—
Flesh forming constituents (*i. e.*, substances containing nitrogen) ...	3.281	17.56
Heat and fat producing matter (*i. e.*, substances not containing nitrogen)	13.529	72.33
Inorganic matters (ash)	1.890	10.11
	100.000	100.00

To this the doctor adds, "It resembles closely in composition a sample of red Clover, and may be regarded as possessing about the same nutritive value in the state in which it has been analysed."

(*To be continued.*)

Home Correspondence.

Liquid Manure.—On clay lands the importance of liquid manure is incontrovertible; as from its not so readily admitting the air, the decomposition of solid excrement, &c., is too slow a process to become available as the immediate food of plants; and the advantage of irrigation expressly of manure on such lands (not forgetting their retentiveness), especially pasture, is immense. These lands are also under the necessity of being drained; and in time of drought (the most important time for irrigation), the drainage pipes are empty, consequently the fertilising liquid might be forced into the already laid tubes (previously plugging up the outfalls) where the inclination of the pipes might fail; and from them forced up by forcing-pumps, here and there, for distribution over the parched or thirsty lands, without incurring the expense of a second relay of pipes for the occasion, at no less than about an equal cost with the first. And, moreover, these pipes could be made to join any company's main that may hereafter be established, and shut off at pleasure by a stop-cock. —Blight also is often the cause of drought, through overcharge of electricity, which may be carried off by water. Then how many cereal as well as green crops might be saved by water irrigation, forced into these pipes and distributed in like manner over the languishing fields? A season or two back such an application would have saved thousands of quarters, and tons of field produce. *An Old Subscriber, Cirencester, January 7.*

Gorse.—In page 845 of your last Number there is an interesting paper, by Mr. Burnett, upon the use of Gorse for cattle. It is surprising how little way this most useful winter and spring food has made in this country, I believe, principally from a supposed difficulty in preparing it. I have now used it extensively for horses, cows, and young stock for many years, and find it the best food for them. After, like Mr. Burnett, trying many modes of preparing it, about five years since I adopted the following with perfect success:—I have a chaff-machine of Richmond and Chandler's, of Manchester, worked by horse-power. This is set to cut half-inch length. The Gorse is mown by a short, strong scythe—two years' growth. A man wearing gloves feeds the cutter, a boy piling it on the feeder with a fork. After a cartload is cut in this way, a little straw is laid upon the wooden trough or feeder of the engine, and the Gorse, which has been cut once, laid upon it with a shovel. The straw pulls the chopped Gorse with it to the cutters, and it thus gets another chop, which renders it quite sufficiently bruised for any sort of cattle. Indeed I like it better than when more bruised. By this method you get the Gorse prepared in a very short time, and with little expense or trouble. In Richmond and Chandler's chaff-machine the stalks, &c., are all cut, without any trouble in looking the Gorse over; and a morning's work will suffice amply to cut Gorse and chaff enough for 100 beasts and 20 horses. I think no one who has ever tried Gorse for either horses, or milking and feeding beasts, or young stock, in conjunction with straw chaff and Turnips, will give it up again. I have lately been in Yorkshire, and seen some of the best farm-yards there. I do not give names, because I do wish to call down a shower of indignation at my ignorance, but I was astonished at the enormous waste of food in what they called their fold-yards. I saw at the establishments of wealthy and well-known men, farming their own land, and with unlimited means at command, well bred cattle of all ages, milking and feeding stock, standing shivering all day in fields, and just at nightfall brought into fold-yards, where they were up to their bellies in wet straw (called manure) with piles of straw and bad hay put for their food. Of course a good fight and scrimmage took place, the straw was all thrown about, and much wasted and trodden down in comparison to what was eaten. In the morning the shivering and expectant system would go on through the day; the cattle would drop all their manure and urine in one spot by the gate, and at night the fold-yard system of making manure would be resumed. Now, if these (say 100) cattle were in boxes, 2 or 3 together, according to ages, the same straw chopped and steamed and mixed with Gorse, Turnips cut by Moody's crusher, and a little ground Corn, or oil-cake, would feed about ten times the number; they would be dry, warm, and comfortable, and their bedding would be really manure of the best quality, without any water in it or loss from it, and in spring would be ready to put upon the land for Turnips, &c., at once. But instead of this, the Yorkshire men (our best agriculturists, in many respects, I am quite ready to admit), too many of them, cast out this wet mass of tangled straw into heaps, and have to leave it there for months, and often even till next year, for the sun and rain to ruin it before they can use it. A farm of 500 acres, with boxes for the cattle and stock of all ages and kinds, fed entirely upon chopped and steamed straw and hay, with Gorse, Turnips, &c., mixed, would be a sight worth going any distance to see. In using Turnips with chaff, Moody's crusher is essential to success; cattle do not pick out the Turnips cut by it, as I find they do by all others. *W. D. Fox.*

Good Cream in Severe Weather.—There is a simple method of obtaining this luxury which I find quite efficacious, and to which I wish to call attention, because I believe it is little practised. The method is to apply hot water under the milk pans immediately on the milk being brought in, and again in 12 hours time. Pans are made by some Staffordshire manufacturers (*e. g.* Wedgewoods or Copelands), so constructed as to allow the hot water to be drawn off, and renewed without disturbance. *P. P. P.*

Does Live Stock Pay?—When a person falls into a mistake, especially when it has a tendency to mislead others, the least amends he can make is to acknowledge it. My calculation being vitiated by the blunder pointed out by "S.," which, gross and culpable as it is, arose not from malice prepense, but from inattention in misplacing a decimal point, I own myself fairly driven from my position. Being thus compelled to reconnoitre the ground, I have determined, in the hope of retrieving my defeat, to take up a new position, which I hope will prove more tenable than the last one. But first I may be permitted to observe that I have no more knowledge of Mr. M'Culloch than any one has who is conversant with the agricultural literature of the past few years, and that I am a tenant-farmer in a county of no mean reputation both for breeding and feeding; and being engaged to some extent in both pursuits, I have no interest or wish but that the matter may be sifted to the bottom. To come to the point, then, it will be found on examining Table I., in Mr. M'Culloch's report, that, in converting live into dead weight, he has multiplied the live weights at the commencement and close of the experiment by the same decimal (.55), which, and not the adventitious rise in the market, accounts for the different values put upon the cattle in the lean and fat state, and likewise for the small apparent increase of dead weight. This will be seen by putting the matter in another form. The proportion of live to dead weight in cattle of the breed employed in this experiment is stated by Mr. Ewart thus (see article "Meat" in Morton's Cyclopedia):—

Condition.	Per cent. of Beef of Live Weights.
Half fat	50 to 55
Moderately fat	56 to 60
Prime to very fat	61 to 63

We cannot be very far wrong then in estimating the dead weight at 50 per cent. of the live weight when lean, and 60 per cent. when fat. We thus arrive at the following result:—

	Live weight.	Dead weight.
At conclusion of experiment ...	4911¼ st. × .6 =	2946.7 st.
At commencement...	4193¼ st. × .5 =	2096.7 st.
Increase		850 st.

Which at 6*s.* 6*d.* per stone amounts to 276*l.* 5*s.* Let us now see at what cost this increase is produced.

	£	*s.*	*d.*
Food (including straw not charged by Mr. M'Culloch)	203	6	2
Interest and Insurance	19	10	0
Attendance	20	0	0
	£242	16	2

Leaving a profit of 33*l.* 8*s.* 10*d.*, and the difference between the value of the litter used and the manure produced. Mr. M'Culloch seems to have considered the manure an equivalent for the straw consumed, attendance, &c. This would account for those omissions which led "S." to suspect that he had been trying his hand at "cooking" his report as well as his cattle food. As to the general question, it is evident that the higher the price of lean stock the greater the share of profit that goes into the breeder's pocket, and that by the unprofitableness of fattening cattle bought lean at a higher rate than they are sold at when fat a negative cannot be proved to the query—"Does Live Stock Pay?" *Aliquis.*

Farming in Ireland.—It seems strange that members of the English Agricultural Society should be ignorant of the progress made in husbandry in the north of the Emerald Isle. For 20 years past the best tups, and the choicest of short-horned cattle have been purchased in Scotland to send to that country. In the selection of implements, in draining, in deep ploughing, &c., they are not behind any agriculturist in this country. Their soil is proverbially fruitful, and it might become in a few years "a land flowing with milk and honey;" nature has been very bountiful to her, but it is unnecessary here to recapitulate the causes of her past troubles and difficulties. It is to be trusted life may be secure, and respect shown for the persons of the future tenants, who may one day prove themselves the true regenerators of this favoured isle. She is capable of producing corn and beef for the support of double or treble her population, and there is no Englishman of any love of country who will not rejoice to behold the day (which may not be far distant) of seeing Ireland one of the most flourishing as well as the most productive of agricultural countries. *X Y Z., Hants.*

Stoppage of Drains.—In the hopes that some of your agricultural readers who have paid attention to the accidents that works of drainage are liable to may be able to explain to me the cause of the following stoppage at the outlet, I send you the particulars for insertion in your next paper. The outlet in question is for two 8-inch pipes, laid side by side, which convey the drainage of 150 acres or thereabouts. The rapid thaw of Saturday and Sunday last of course filled every drain to overflowing, and a large body of water escaped at this outlet. An iron grating, the bars of which are 2 inches apart, is built into masonry to prevent rabbits or other vermin from entering the drain. On examining this outlet yesterday, I found the bars of the grating totally stopped up with a substance which appears to me to consist of fine white threads or rootlets, but reduced to a solid mass by the finest particles of sand, and when squeezed dry in the hand almost resembles putty in consistency. The stoppage had caused the water to find another exit through the masonry. The whole of the small drains are 4 feet deep; so if I am right in supposing these threads to be roots, from what can they spring? No doubt the flushing the drains got would cleanse them from a great deal of sediment, &c.; but what I should wish to learn from some of your readers who may be more practical drainers than I am is, whether any of them have experienced a similar stoppage, or can inform me of any contrivance that would exclude vermin from the drain, at the same time allowing this sediment to pass out. *J. P.* [These growths ascend the stream, and their origin should be looked for in the ditch if they block up only the termination of the drain.]

Bread and Flour.—As one of your subscribers, may I ask you or any of your contributors to explain to me the disproportion in the price of bread and flour at this time to the price of Wheat, as compared with other periods of high prices. The average price of Wheat by the last returns is 73*s.* a quarter, and the price of the quartern loaf now is 11*d.*; but in the month of May, 1847, when the average price of Wheat rose to 105*s.* a quarter, the highest price of the quartern loaf was 1*s.* 2*d.* Now, the youngest of your readers would condemn such arithmetic as that of this Rule of Three sum — 105*s.* : 73*s.* : : 14*d.* : 11*d.* Ought not the millers and bakers to be sent back to school to learn that, instead of 11*d.*, 9¾*d.* should be the fourth term? The schoolmaster, however, is abroad in your columns, and to him I will look for a solution of the problem. Does it lie in the bad flour quality of the Wheat of last harvest? What is the usual proportion in average seasons of flour to the Wheat grain; *i. e.*, how many pecks of the former to a bushel of the latter? and what is the supposed or ascertained proportion for this season? *John Hall, Brentwood.*

Societies.

HIGHLAND AND AGRICULTURAL, *Jan.* 10.—A general meeting of the Society was held, and attended by about 140 of the members; the Duke of Hamilton in the chair. One hundred and twenty-one new members were admitted.

Agricultural Statistics.—Sir John M'Neill reported the satisfactory conclusion of that work.

The inquiry naturally divided itself into two parts; the first being to ascertain the number of acres, and the distribution of crops in the three counties to which the inquiry was confined. That part of the inquiry was conducted in this manner:—Returns were sent to the different occupants of land, which they filled up and returned to the enumerator. Committees, consisting of the enumerator and agricultural representatives from each parish, were formed in the different districts, and to them it was intrusted to state from their own observation and experience the amount of produce per acre. That duty necessarily involved a perfect reliance on the part of the Society on their integrity and intelligence, and he had pleasure in stating that all the information which he had collected led him to the conclusion that that duty had been most faithfully performed. He was aware that a doubt had been expressed as to the sufficiency of the information attained in that way; but he believed that almost every one connected with agriculture, and acquainted with the subject, would concur with him in thinking that the information so obtained as to the acreable produce of these counties was at least as much to be relied upon as if returns had been filled up by each occupant of land, giving the amount of produce on his own farm. He thought it would be expecting too much to suppose that there would be in every return a perfectly accurate statement of the produce per acre, and he believed the truth to be that they got nearer to an accurate estimate by the help of these committees than they would have done had they relied on the individual accuracy of each occupant of land. He thought it would be wrong not to direct the attention of the Society to the obligations which they owed to the enumerators and to the gentlemen who had served upon these committees. There was also another person to whose services he had in a more special manner to direct attention. The directors, on the completion of the returns, had agreed upon a minute to the effect that, in reporting the termination of the work to the

general meeting, it was the opinion of the directors that the secretary should receive the thanks of the Society for the manner in which he had conducted the inquiry. (Cheers.) It was hardly necessary for him to add one word to such an opinion expressed by the Board of Directors, but having had occasion to observe very closely the proceedings of Mr. Maxwell during the whole course of the inquiry, he felt that he could not speak in terms too high of the estimate he had formed of his tact, of his activity, and of his judgment and good management. He thought the Society was deeply indebted to Mr. Maxwell for the manner in which he had conducted a rather delicate and difficult duty. (Applause.)—The Duke of Buccleuch said he might be allowed to second the proposal of Sir John M'Neill, with reference to the enumerators engaged in collecting these statistics, and also with reference to the unwearied zeal and activity of their secretary, to whom the success of the great work just completed was mainly to be attributed.—Mr. Hall Maxwell acknowledged the compliment paid him.

Peruvian Guano.—Mr. Pringle, of Whytbank, proposed the adoption of the following memorial to the Treasury upon this subject.

"That the attention of your memorialists has lately been called to a report, by the admiral in command on the Pacific station, as to the supply which the existing deposits of Peruvian guano will probably yet afford. Your memorialists observe with some alarm that Admiral Moresby's opinion of the quantity available for exportation differs materially from, and is far below, the estimates that have been formed by other parties; and they submit that, in a matter of such vast importance to the British agriculturist, immediate steps should be adopted with the view of ascertaining, by means of a detailed and authoritative survey, the actual state of the case. The memorialists, looking to the possible failure of the Peruvian supply, would further respectfully suggest the expediency of employing the most efficient means for exploring other deposits of guano which may yet exist undiscovered; and, if necessary, of despatching a special expedition for this purpose. May it therefore please your lordships to take the premises into consideration, and to order such measures as may give effect to the prayer of your memorialists."

The memorial was adopted.

Berwick Show.—Mr. Horne, of Langwell, convener of the committee on general shows, reported the satisfactory nature of the arrangements for the meeting at Berwick.

The show takes place during the first week of August on the Magdalene Fields, granted for the purpose by the Duke of Northumberland. The premium list had been finally adjusted, after having been approved of by meetings held at Berwick, Dunse, and Kelso; and the premiums offered by the Society for stock and implements amount to between 1200*l.* and 1300*l.*

Poultry.

Liverpool.—The first annual exhibition at this town of merchant princes was held at Lucas's Repository, on Tuesday and Wednesday last. The place is well adapted for the purpose, and the committee, at considerable expense, removed part of the roof, and substituted glass; thus adding to the light of the building and its general appearance. Although our province is to speak of poultry, yet as the place in which a show is held has to do with the exhibition itself, we cannot help remarking the graceful appearance of that chosen, and the air of cheerfulness it imparted to the *coup d'œil*. The roof is coloured after the manner of the Crystal Palace in London, and the building is surrounded by full-sized casts of the best of the ancient and modern statues. The novelty of the thing will be our excuse for mentioning that which would otherwise be irrelevant. The show consisted of 357 entries, and it may be safely averred that in the same number of pens so many good birds were never before met. Spanish came first in order, and being within a few miles of Knowsley Cottage, it was predicted the prizes would fall to the lot of Capt. Hornby, and the prophets were right. He took first and second prizes for adults, and first for chickens. The second was taken by Mr. Hardy, of Warrington. There were 29 entries in these two classes. The next class of adult Dorkings was pronounced by the judges highly meritorious. Capt. Hornby here again took both prizes. In class 4, chickens of 1853, against 22 competitors, Mrs. Towneley Parker took first, and Captain Hornby second, prizes. These classes of Dorkings deserved every commendation, being composed, with few exceptions, of first-rate birds. The white Dorkings were not numerous, but in the adult class Mr. James, of Moseley, and Mr. Fell, of Warrington, had good birds. In class 6, Mr. Rawson took first prize with a pen of remarkably good chickens; Mr. R. Gibson took the second. Next came the Cochin Chinas, and here the old birds were certainly the best we have seen for many months. Mrs. Lydia Stow, a well-known name in poultry annals, took the first, and Mr. Mitchell, of Keighley, second. There were 49 entries for competition in the chicken class, and the honours were awarded as follows, in order, to Mr. J. Harrison and Capt. Hornby. Mrs. Stow here took three commendations, and her birds were immediately sold. Class 9 was weak, Messrs. Hindson and Clare took the prizes. In the young birds Mr. Archer of Malvern stood first, with a pen of unusual weight, and Mr. Job was second. There was no award in class 11 for white adults, but Messrs. Rawson and Job were deservedly successful in the birds of 1853. We cannot speak favourably of the black Cochins, the cocks are invariably faulty, one only prize was given to Mr. Fox. Mr. Trapp, of Bedford, was successful in both classes of Malays. The largest prize-taker in the game classes is always Mr. Mousey, of Norwich, and as usual he here took three prizes. Messrs. Bullock, Turner, Cox, of Derby (2), Dixon, and Pearse, also took prizes in the various classes. Messrs. Rawson and Josiah Chune carried off the first in the golden pencilled Hamburgh classes, and Mr. Worrall took the second. Among the spangled, Mr. Fell and Mr. West had the honours of the adult classes, while those in the younger birds were awarded to Messrs. Dixon and Rawson. We cannot praise Class 27, and one prize only was awarded, to Mr. Mitchell, of Keighley. The same gentleman took the first prize for chickens, class 28, silver pencilled Hamburgh, while the second was given to Mr. Dixon. We expected good silver spangled in the country of the "moonies," and were not disappointed. Mr. Mitchell was here again in force, taking one first and one second prize; Mr. Rawson also took a first, and Mr. Alison, jun., a second.

We now come to the Polands, in which this show was pre-eminently strong. We have seldom seen so many good birds at one time. We believe we may say, without fear of contradiction, never, save at Birmingham. The black with white top-knots deserved their name, not from trimming but from their goodness. Mr. Thomas Beesley and Mr. Joseph Conyers were first and second. For golden, Mr. Joseph Conyers and Mr. C. Rawson. For silver, Mr. Baker and Mr. Greenall. The gold laced bantams were good, and Mr. G. W. Moss and Mr. C. Rawson were first and second on the list. For the silver-laced, Mr. Rawson took both prizes. For white, Master Brockelbank. For black, Mr. G. W. Moss and Mr. Joseph Conyers. To the amateur the 10 pens of competing geese were in themselves an exhibition. Mrs. Towneley Parker took both prizes, the first pen weighing 74 lbs. Mr. Rawson was foremost in Aylesbury ducks, with excellent birds that won in spite of the bad condition in which they were exhibited. Mr. Weston second. Mr. Pearse took first prize with a pen of remarkably well bred Rouen ducks; Mr. Worrall stood next with very good birds. Mr. Bradford was successful with Buenos Ayrean, and Mr. Bird with call ducks. These were very excellent specimens. The turkeys were very large and remarkably handsome; Mr. J. Conyers took first, and Mr. John B. Neilson second prizes. A pen of wild turkeys of such extraordinary merit was also exhibited by the latter gentleman, that an especial extra first prize was given to them. We doubt if they can be equalled for purity in the United Kingdom.

The attendance was large, too much so for the space, and next year a larger building must be found. Everything was conducted in a praiseworthy spirit of liberality, and perfect success was not only deserved but attained. Much of it is due to the unwearied exertions of Mr. G. W. Moss, the Secretary. The most salient points of the show, to those interested as breeders or exhibitors, will be—first, the continuation at every successive show of the difficulty, we might almost say the improbability, of getting a black Cochin China cock. Next, the hopelessness of expecting a prize for white Cochins, if green-legged birds are to be found in the pen, and to reiterate the assertion in regard to game fowls. It is almost painful for judges to pass over pen after pen of otherwise meritorious birds, because the colour of the legs of the three birds are all different. In no class is uniformity more essential. We were very glad to see cottagers competing in the different classes. The judges were—E. Hewitt, Esq., Eden Cottage, Spark Brook, Birmingham; Mr. Baily, Mount Street, London.

Torquay and South Devon.—The second exhibition of the Torquay and South Devon Association for the improvement of domestic poultry, took place on Wednesday, Thursday, and Friday, the 11th, 12th, and 13th of January, in Union Street, Torquay, and was well attended by the nobility and gentry of the town and neighbourhood. The show, altogether, was decidedly a superior one; and although it could not vie in numbers of pens with some which have preceded it in other parts of the country, the quality of birds shown amply made up the deficiency. The Spanish, Dorkings, Shanghaes, game and Hamburghs were well represented, and equally well contested, as were also the turkeys and ducks. Mr. Edward Hewett, of Eden Cottage, Sparkbrook, near Birmingham, acted as judge, and gave general satisfaction by his awards.

Right or Wrong?—A friend lately sent me a fine Cochin China cock and two hens. As I dislike any fighting in the yard, I made way for the stranger by removing the late Sultan. I am now told that I did an injudicious thing, "for," says my informant, "I lately saw a Cochin fowl brought to table, a large coarse bird, and I was told he had eat as much as would fatten a pig! that he made fat in lumps, but very little meat on the breast." If this is the propensity of this species of fowl, I shall not encourage the breed, for in a hurry, or in a dark day, one might get a lump of this golden treasure in the mouth! then farewell to poultry for ever! * * *

Calendar of Operations.

JANUARY.

Border of the Fens.—The work done on the farm has been of a desultory character for the last few weeks, all regular employment being much interrupted by the weather. We finished Wheat seeding on December 15, the very day the frost set in with any severity, snowing and blowing alarmingly while the last acre was put in, since which time the horses have not been on the land at all, excepting for the purpose of carting manure. Our chief care has been to attend to the stock, which have gone on very well, having before the blast had 7 or 8 acres of Swede Turnips "topped and tailed," and secured with earth in large clumps or heaps. Near these the lamb hogs have been folded with a double line of trays enclosed, to contain Oat straw, which they eat readily, and which shelters them from the wind, as shown by their lairing close to the trays every night. The snow has been so deep that persons having only white Turnips and eating them on the land, have been obliged to have their lamb hogs brought near the homestead, and fed on hay and corn. One farmer who had not folded his sheep, lost seven last week by their walking into a dike concealed by the snow. The frost has been so intense as to make it difficult to procure water for the stock; the troughs became a mass of ice, and when broken in a pond it was of great thickness and somewhat daugerous to keep open. The desirableness of keeping sheep in tolerably good condition has been sufficiently shown this winter, for the ewes have chiefly had to subsist on such a scanty supply of Grass as they could procure by scraping away the snow with their feet, some hay or straw, with a few Turnips, being carted to them daily. Last week we threshed Barley, the produce of a 5-acre field yielding 4½ qrs. per acre. The rent of the field was 10*l.*; tithes and rates, 2*l.*; seed, 3*l.*; ploughing, drilling, weeding, &c., 4*l.*; mowing and tying, 1*l.* 15*s.*; threshing, 3*l.* 6*s.*; dressing, 15*s.*; delivering, 17*s.*—in all, 25*l.* 13*s.* It was sold at 44*s.* per quarter, leaving a far greater profit than we expected. Manure carting has been proceeded with when practicable, but the roads have been in a dangerous state, as, although "turned up" by the smith, one mare slipped and sprained one of her legs seriously by falling with a load. Gravel raising has employed two men at 4*d.* per yard. Dyking and draining could not be done, owing to the snow and wet. Frost has hindered bedging operations; but we may observe on this head that more attention should be bestowed on Brambles and Elders than is usually accorded. Brambles and Briars are very troublesome to sheep, and, if not rooted up, will choke the Whitethorn and get the mastery; Elder, on the other hand, will make a naked fence and encourage gaps. Wherever the crops have been at all decent, the present prices must be admitted to be greatly remunerative; but persons who are not farmers exhibit most illiberal scepticism on the possibility of agriculturists suffering loss at the present untoward season. The returns of some farmers are almost incredible, from their unexpected nothingness, comparatively speaking; some (as the itinerant threshers with steam or horse-power have the misfortune too often to verify) do not realise a sack an acre. We commonly hear of less than 2 qrs. an acre, the weight of such defective crops being generally less than 17½ stones per coomb. The delivery, unless first dressed and measured, scarcely ever equalling the estimate formed in the stack. Is it surprising, then, that the quantities brought to market should be so small, or that the prices should range so high? A miller said the other day, it was to be desired that prices should now get up, or the chance of our future privation must be increased by the facility afforded to the foreign buyer to decrease our stock. Better supplies will, no doubt, be forthcoming from this quarter in the spring; but it is a grave consideration whether the free operations of commerce can be coerced to preserve for our own use a sufficiency of the necessaries of life until the next harvest is available. It is a very grave question whether any steps can be safely taken to obtain larger supplies without creating such an exaggerated alarm as will only in the end increase the mischief. At all events, we hope the vigilance of those in power will not neglect any fair means of encouraging the transit from abroad of every article of food that friendly nations may have to dispose of; for it is fearful to contemplate the agony of masses of misguided people wanting bread! *J. W., Peterborough.*

South Hants.—The late sown Wheat is but just visible and looks very weak; we never remember November sown Wheat so backward. The early sown has been eaten short down by larks in some places. The yield of Barley is very indifferent, but much of the soil on the southern coast, though admirable for Wheat, is not a Barley soil, 10 sacks to 12 being the most oft these loams per acre. The average yield of Wheat is not more than 5 sacks; of Barley, 6 to 7 sacks; of Oats, 6 to 8 sacks; but in South Hants Barley and Oats follow Wheat. Very few beasts are fattened on a farm; on most farms none at all. Sheep are the principal stock, and a few milch cows. Very few breed any kind of stock. Pigs are numerous, and the breeds good, but there are few who pay any regard to this very valuable animal on a farm, viz., the pig. The sheep are clearing fast their Turnip "breaks." The hay turns out bad; of 100 ricks not above four or five are sweet. Most of the hay crop was water-washed, and consequently the saccharine matter lost. Ploughing is again commenced, and the frost which penetrated 6 to 7 inches in depth has rendered the land wholesome and friable. Markets are high, and amongst the poor much distress prevails. *F. S.*

West Sussex, *Jan.* 10.—The snow has not been very thick with us, and during the intense frost that we have had the young Wheat has been quite exposed to its cutting action; but not with any bad effect, for during these four or five days that we have had of very mild damp weather, it looks as fresh as it has done at any time, and having had the soil laid more open about the roots it will be able to spread them more freely when the season induces it to do so. Turnips have been bound up in the land, and the sheep depending upon them have not done so well, especially as they do not relish the quality of the hay, which is common this year. There is not much out-door labour that can now be done, as the land is very wet on the top and the frost is not entirely out of the under part, where it has got itself well established. But on the heavy lands we are never at a loss for horse labour in carting chalk, and the season has done well with it, the frosts having broken it down on the land as quicklime falls when water is applied to it. The prices of all provisions are getting higher, and, as the weather has been unusually severe, it has been very hard with the labourer. No doubt the rule of supply and demand must always regulate the labour market, as well as others, yet when there are sufferings like the present brought upon the labourer, some extra remedy ought to be provided. But of all the cures that can be applied none are more mischievous than that of giving the highest wages to those who most require it instead of to those who are most worthy of it. *G. S.*

Notices to Correspondents.

Averages: *T P.* The average prices of Wheat in 1851, 1852, and 1853, were 38*s.* 6*d.*, 43*s.* 4*d.*, and 48*s.*

Bone-dust: We do not know where near Liverpool genuine steamed bone-dust is to be had. For that and superphosphate you had better apply to Mr. Lawes (see Advertisement). The best Turnip manure, probably, is 3 or 4 cwt. of Bolivian guano, in which the ammonia has been fixed, and a portion of the phosphate of lime dissolved by the addition of 60 or 70 lbs. of sulphuric acid.—For Grass soot might be, in some places, as cheap a dressing as any, but generally guano is one of the best.—To correct the overgrowth of haulm in a peaty soil you must add earthy matter to the soil. Put on a hundred cubic yards of clay per acre before winter.—One of the best yellow Turnips we know is the common (so-called) "Aberdeen Bullock" Turnip.

Clearings round a Field: *Constant Subscriber.* You could get a good crop of Vetches from the cleared space, and the soil would then be in better order—older and firmer—for receiving small seeds afterwards.

Covered Stackyards: *Derby.* We do not know where in the Midland Counties you can see a roofed stackyard. Perhaps some correspondent can inform you. We should be obliged, too, if any one can inform us, for your information, where any instance exists of the use of *moveable* sheds or other shelter for sheep folded in the fields, and where (in the Midland Counties) house-feeding of sheep all the year round is practised.

Dartmoor: *D H McD* says, "On the sheep-feeding in the house, in the *Agri. Gazette* of the 7th inst., it would be most satisfactory if Mr. G. W. Fowler would describe the food he feeds his sheep with at a ¾*d* per day."

Directions of Drains: *A Draining Engineer.* We hope you can wait for a while.

Farm-receipts: *Neophyte.* A long answer is needed and hence the delay, for we really have not room for long replies. You shall have a full reply as soon as possible.

Indian Corn: *M B W.* If you consult the Index to the Volume for 1847, under head of "Food," you will find receipts.

Oat-cakes: *A Distressed Housekeeper* asks for a receipt for making "Scotch Oat-cake."

Peruvian Skinless Barley: *H W C.* You must trust to our advertising columns; if they do not help you, we cannot.

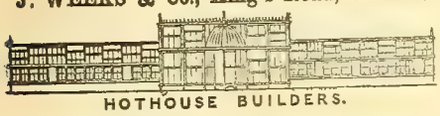
Root-grating Machine: *D H McD.* It should be advertised. We will speak of its use next week.

Seed: *J L.* Oats of 1852, not yet threshed, will make good seed for spring of 1854; many farmers would *prefer* it.

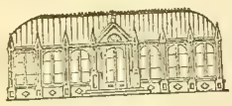
Wooden Shoes: *A Constant Subscriber* asks where they are made, and at what prices.

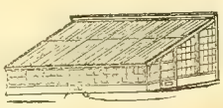
HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,



HOTHOUSE BUILDERS.





The Nobility and Gentry about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

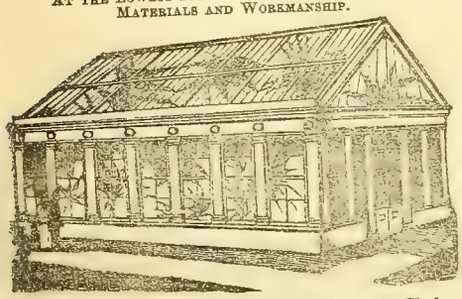
The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1*s.* 3*d.* per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8*d.* per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

TO AMATEUR GARDENERS, LOCAL BOARDS OF HEALTH, & SANITARY WORKS.

PATENT GLASS TUBES, Iron Coated with Glass, Gutta Percha, Combinated ditto, Patent Flexible India Rubber Tubing, and every other Hose for Watering Gardens. The Hydraulic Ram, Fire, Garden, and every other kind of Pump, Sluice Cocks, Hydrants, High Pressure Cocks, and all other articles to be had, Wholesale and Retail, of

FREEMAN ROE,

HYDRAULIC ENGINEER,

70, Strand, and Bridgefield, Wandsworth.

GLASS FOR CONSERVATORIES, ETC.

HETLEY AND CO. supply 16-oz. SHEET GLASS, of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery.

Lists of Prices and Estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY & Co., 35, Soho Square, London.

See *Gardeners' Chronicle* first Saturday in each month.

GLASS FOR CONSERVATORIES, GREENHOUSES, PIT FRAMES, ETC.

JAMES PHILLIPS AND Co. have the pleasure to hand their present prices of Glass for Cash:—

SHEET SQUARES. In Boxes of 100 feet.	£	s.	d.	CROWN SQUARES. In Boxes of 100 feet.	s.	d.

Orchard House Squares on Mr. Rivers's approved plan, to whom I have sold some thousands of feet:—20 inches by 12, 20 by 13, 20 by 14, 20 by 15, 20½ by 12½, 20½ by 13½, 20½ by 14½, at 20*s.* per 100 feet.

200 feet cases at 42*s.*, and 300 feet case 63*s.*, in large sheets.

Boxes charged 1*s.* extra per 100 feet, and the same allowed if returned free of all charge.

HARTLEY'S PATENT ROUGH PLATE GLASS, Fern Shades, Striking Glasses, Milk-pans, Bee Glasses, Cucumber Tubes, Sheet and Rough Plate Glass Tiles, Wasp Traps; Plate, Patent Plate, Crown and Sheet Window Glass, in every thickness and quality, and Ornamental Glass, plain and coloured; pure white Shades for Ornaments, Crystal Glass for Pictures.

Warehouse, 87, Bishopsgate Street Without—same side as Eastern Counties Railway.

READ'S GARDEN ENGINES, SYRINGES, &c.—When an article of real utility attracts public attention, imitators start into the field to snatch from the inventor the just reward of his labours. It has now become a daily practice of exhibiting in the windows of ironmongers and others, Syringes of the *very commonest description*, with the words "READ'S PATENT," as an inducement to purchasers. This, as an eminent writer on Horticulture has recently remarked on the subject, is indeed "living upon another man's fame."

READ'S instruments have the royal arms, with the address, THIRTY-FIVE, REGENT CIRCUS, LONDON.

HORTICULTURAL BUILDINGS, ROCK AND RUSTIC WORK, ORNAMENTAL WATER, FOUNTAINS AND FALLS, AND LANDSCAPE GARDENING, executed on the best principles; Estates Improved, Land Laid Out for Building, &c., by Mr. GLENNY, Valuer, Estate and Horticultural Agent, 420, Strand.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application.

CUCUMBER AND MELON BOXES AND LIGHTS.—One hundred 1, 2, and 3-light Boxes and Lights of all sizes, ready for immediate use. Warranted best materials, packed and sent to all parts of the kingdom; 2-light Boxes and Lights from 1*l.* 6*s.* Garden Lights of every description, Conservatories, Green and Hothouses made and fixed in all parts of the kingdom. References given to the nobility, gentry, and the trade, in most of the counties in England.—JAMES WATTS, Hothouse Builder, Claremont Place, Old Kent Road, London.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

HEAL AND SON'S EIDER DOWN QUILT is the warmest, the lightest, and the most elegant covering, suitable for the bed, the Couch, or the Carriage; and for Invalids, its comfort cannot be too highly appreciated. It is made in three varieties, of which a large assortment can be seen at their Establishment. Lists of Prices of the above, together with the Catalogue of Bedsteads, sent free by post.—HEAL & SON, Bedstead and Bedding Manufacturers, 196, Tottenham Court Road, London.

QUALITY THE TEST OF CHEAPNESS.

BERDOE'S OVERCOATS AND CAPES resist any amount of rain. One of the largest Stocks in London of First-Class GARMENTS at Lowest Charges. DRESS COATS 3*l.*; BOY'S SUIT, 11*d.* per inch, according to height.—96, New Bond Street, and 69, Cornhill. (Nowhere else.)

GLENNY'S BALBRIGGAN HOUSE, Lombard Street, City.—Established for the Sale of GENUINE BALBRIGGAN HOSIERY, manufactured by CHARLES GLENNY, who introduced this beautiful Irish fabric at the Great Exhibition, and obtained the Prize Medal.—Irish Knit Hose and Half-Hose, Limerick Gloves, &c. Irish Linens can be obtained at the above Establishment.

GREAT SAVING OF TIME AND MONEY.

R. RESTELL'S PATENT ECONOMICAL GAS APPARATUS for Forcing Houses, Greenhouses, Conservatories, Pits, Shops, Counting Houses, Warehouses, Drying Rooms, &c. &c., possessing all the advantages of Hot Water at half the expense of fitting, and most trifling cost for Gas, far surpassing any ordinary Gas Stove, requiring no furnace, and allowing of no fumes or evaporation in the Building, or possibility of accidents from negligence or carelessness. It has been tested through the late severe weather, on a variety of Plants, and found most satisfactory. It is very quickly fitted up and requires no night attention.—Apply to the Inventor and Patentee, R. RESTELL, 35, High Street, Croydon, Surrey.

Persons wishing to have Houses fitted will please to send the height and dimensions.

FIRE ANNIHILATOR, OR VAPOUR FIRE ENGINE.—Its practical value proved incontestably by 23 remarkable cases of successful use. See "Bradshaw" of this month, p. 132. Engines for Dwelling-houses, 3*l.* to 4*l.*—Office of the Fire Annihilator Company, 105, Leadenhall Street, London.

THE COTTAGER'S STOVE.—An economical, compact, and portable COOKING APPARATUS, combining a good sized Oven and Hotplate; may be had with or without a boiler, and will cook sufficient for a dozen persons with the consumption of 1 lb. of coal or coke per hour. It requires no fixing, may be placed in any apartment, and is a great security against accidents from fire. It will burn Coal, Coke, or Wood. They are also specially adapted for Emigrants, and may be seen in operation daily, at the Manufacturers', D. & E. BAILEY, 272, High Holborn, London.—Price 50*s.*, and upwards.

TO BE LET, a GOOD FARM of 400 Acres and upwards (of which 117 acres are Pasture), at Arlsey, Bedfordshire. On Lease. The Shooting to be reserved. The Homestead is about a mile from the Arlsey Station, on the Great Northern Railway.—For further particulars, and an order to view, apply by letter, giving references as to responsibility, &c., to Mr. S. WRIGHT, Solicitor, Hitchin, Herts; or to Mr. HEARD, Land Agent, St. Margaret's, near Ware, Herts.

TO BE LET, with immediate possession, a well- stocked MARKET GARDEN, containing Four Acres, with a good House and Appurtenances, situate at Harborough Hills, in the flourishing town of Barnsley.—Application to be made to Mrs. POLLARD, Harborough Hills, Barnsley.

DENYER'S NURSERY, celebrated for ROSES, &c., Established 26 years, consisting of Five Acres of Land, House and Seed Shop attached, of which a 14 years' Lease will be granted. The Proprietor being about to retire, is desirous of offering the above, as an opportunity that rarely occurs to the trade, with a first-rate ready-money connexion, and the Stock to be taken at a valuation, two-thirds to be paid on taking possession; time will be given to pay the balance. No Goodwill is expected.—Apply to Messrs. PROTHEROE & MORRIS, Leytonstone, Essex; or Mr. E. DENYER, on the premises, Loughborough Road, within three miles of London.

TO BE SOLD, a SEED BUSINESS in one of the principal towns in the North of England. The premises are situated in the best business part of the town, are extensive and calculated for carrying on a large trade.—For further particulars, or to treat, apply, with real name and address, to A. Z., Office of this Paper. N.B. A Nursery Stock may also be had at a valuation, if desired.

SILVER SPANGLED HAMBURGHS.—Fine well bred BIRDS of the above sorts, 8 months old, to be disposed of, at from 10*s.* to 15*s.* per pair.—Enquire of Mr. CANTRELL, Surgeon, Wirksworth; or the parties would be willing to exchange some of them for the White-faced Spanish, if good ones.

FANCY POULTRY.—One Dorking Cockerel, nine months old, 30*s.*; three Rumpless Fowls, Cock and two Pullets, 36*s.*; three Sebright Bantam Pullets, 25*s.*; two Black Bantam, Cock and Pullet, 20*s.*; three White Turkeys, Cock and two Hens, 45*s.*; three Golden-pencilled Turkeys, each, 25*s.*; two pair of White Cochins, per pair, 48*s.*; three pair of Light Buff, per pair, 25*s.*; one Brahma Pootra Cockerel, 7 months, 10*l.*; two Brahma Chickens (Cocks), late hatched, 50*s.* each.—Apply, enclosing stamped directed envelope, to Rev. T. PRATER, Middleton Stoney, near Bicester.

Sales by Auction.

PRIZE POULTRY.

MR. J. C. STEVENS is instructed by John Fairlie, Esq., of Cheveley, to announce for sale by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, 31st January, 1854, at Twelve o'Clock precisely, a selection from his renowned Yard of Poultry, consisting of FIRST CLASS COCHIN CHINA, DORKINGS, BRAHMA POOTRAS, SCOTCH DUMPIES, &c., including many of his Prize Birds.—Catalogues, by enclosing a stamped directed envelope to Mr. J. C. STEVENS, 38, King Street, Covent Garden.

Important sale at Betley Hall Poultry Yards, of pure bred Shanghae Poultry, including almost every variety of fancy colours, and many really choice and valuable birds; bred from stock procured from some of the most celebrated amateurs in the kingdom.

MR. FOWLES has been honoured with instructions from GEORGE TOLLET, Esq., of Betley Hall, Staffordshire, to sell by Auction, at his Poultry Yards, at Betley Hall aforesaid, on FRIDAY, January 27, at 12 for 1 o'clock precisely, 125 pens of PURE BRED SHANGHAE POULTRY, containing 250 birds, which may be viewed on the morning of the sale. Catalogues may be had from Mr. W. FOWLES, Wall-fields Farm, Nantwich, on receipt of two postage stamps.

A CONSIGNMENT FROM GHENT, FROM A CELEBRATED GROWER, FOR ABSOLUTE SALE.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew Lane, on THURSDAY, February 2, at 12 o'clock, about 400 Double Camellias, 300 Indian and Ghent Azaleas, well set with bloom buds; also 300 Rhododendron Arborea, 500 Gladiolus Gandavensis, with 500 Standard and Dwarf Roses.—May be viewed the morning of sale; Catalogues had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

TO NOBLEMEN, GENTLEMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. Cutbush, to Sell by Auction, on the premises, Barnet Nurseries, Middlesex, on THURSDAY, Feb. 9th, at 11 o'clock, without reserve, in consequence of a portion of the land being purchased by the Magistrates of the County of Middlesex for the erection of stores for the militia, the whole of the NURSERY STOCK growing on the two acres, consisting of Ornamental Fruit and Forest Trees, Evergreens and Deciduous Shrubs, Standard and Climbing Roses, Box Edging, &c.—May be viewed prior to the Sale. Catalogues may be had on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

EDUCATION FOR YOUNG LADIES,
AT CHESHUNT, HERTS, ADJOINING THE NURSERIES.

MISS PAUL, who has had several years' experience in Tuition, begs to announce that she has vacancies for a few Pupils as Boarders. Terms moderate. Prospectuses will be forwarded by post on application.

KNOW THYSELF!—Professor BLENKINSOP continues to receive from individuals of every rank the most flattering testimonials of his success in describing the CHARACTERS of Persons from their HANDWRITING, pointing out their mental and moral qualities, whether good or bad.—Address by letter, stating age, sex, and profession, inclosing 13 uncut postage stamps, to Dr. BLENKINSOP, 344, Strand, London.

YOURSELF! WHAT YOU ARE, AND WHAT FIT FOR. ELLEN GRAHAM continues to give her novel and interesting delineations of character from an examination of the Handwriting, in a style of description peculiarly her own, filling the four pages of a sheet of paper. Persons desirous of knowing their true character, or that of any friend, must send a specimen of the writing, stating sex and age, or supposed age (including 13 penny postage stamps) to Miss GRAHAM, 14, Hand Court, Holborn, London, and they will receive in a few days a minute detail of the gifts, defects, talents, tastes, affections, &c., of the writer, with many other things hitherto unsuspected.

Seventh Edition, "A Few Words before Matrimony," sent post free on receipt of six postage stamps.

RUPTURES EFFECTUALLY CURED WITHOUT A TRUSS.

ALL Sufferers from this complaint are earnestly invited to consult or write to Dr. LESLIE, as he guarantees them relief in every case. His remedy has been successful in curing thousands of persons during the last 11 years, and is applicable to every kind of single and double rupture, however bad or long standing, in male or female of any age, causing no confinement or inconvenience in its use whatever. Sent post free, with full instructions, on receipt of 7*s.* 6*d.* in postage stamps, or Post Office order, payable at the General Post Office, to Dr. HERBERT LESLIE, 37A, Manchester Street, Gray's Inn Road, London, where he may be consulted daily, Sundays excepted, from 11 till 1, mornings, and 5 till 7 evenings only.

WM. HALSE'S FIVE GUINEA APPARATUSES are now ready.—Invalids are solicited to send to Mr. W. HALSE, of 22, Brunswick Square, London, for his Pamphlet on MEDICAL GALVANISM, which will be forwarded free, on receipt of two stamps. In it will be found the particulars of cures in cases of asthma, rheumatism, sciatica, tic doloureux, paralysis, spinal complaints, headache, deficiency of nervous energy, liver complaints, general debility, indigestion, stiff joints, nervous disorders, &c. Mr. HALSE'S method of applying the galvanic fluid is quite free from all unpleasant sensation. Terms: One Guinea per week. The above Pamphlet contains his Letters on Medical Galvanism.

ATKINSON AND BARKER'S ROYAL INFANTS' PRESERVATIVE.—Mothers call at your Druggist's and purchase a bottle of the above. It is the best medicine in the world for infants and young children for the prevention and cure of those disorders incident to infants; affording instant relief in Convulsions, Flatulency, Affections of the Bowels, Difficult Teething, &c. &c., and may be given with safety immediately after birth. It is no misnomer cordial! no stupefactive, deadly narcotic! but a veritable preservative of infants! Mothers would act wisely in always keeping it always in the nursery.—Prepared only by ROBERT BARKER, Bowden, near Manchester (Chemist to Her Most Gracious Majesty Queen Victoria), in bottles at 1*s.* 1½*d.*, 2*s.* 9*d.*, and 4*s.* 6*d.* each. CAUTION.—Observe the names of "Atkinson & Barker" on the Government Stamp.

PAUL GAGE'S ELIXIR.—This family medicine has been established 44 years as a most valuable remedy for

PHLEGM,

and all the disorders arising from it, viz., bilious complaints, catarrh, asthma, convulsive coughing, indigestion, colics, cholera morbus, ague fevers, gout, worms, hooping cough, females' complaints, &c. It is demonstrated in a pamphlet on Phlegm, delivered gratis at all the depots, why PAUL GAGE'S ELIXIR has not failed in desperate cases, where other means have been found of no avail. Sold in bottles at 2*s.* 9*d.*, 4*s.* 6*d.*, and 11*s.*, by PAUL GAGE, 462, New Oxford Street; and by all respectable medicine vendors.

HOLLOWAY'S PILLS FOR THE CURE OF BILE, GIDDINESS, AND DETERMINATION OF BLOOD TO THE HEAD.—These Pills, so well known, supersede all other medicine, for the suppression of an undue secretion of bile, they give relief to that sensation of fulness frequently felt after eating; cure headaches, prevent pains, giddiness and determination of blood to the head, habitual costiveness is obviated by their use, and for dropsical complaints they stand pre-eminent for strengthening and cleansing the stomach. HOLLOWAY'S Pills are the very best remedy ever discovered; they also increase the appetite and promote digestion, giving an hilarity of feeling and buoyancy to the spirits.—Sold by all Druggists, and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

PAINS IN THE BACK, GRAVEL, LUMBAGO, RHEUMATISM, GOUT, INDIGESTION, FLATULENCY, NERVOUSNESS, DEBILITY, &c.

DR. DE ROOS' COMPOUND RENAL PILLS, as their name Renal (or the Kidneys) indicates, are a most safe and efficacious remedy for the above dangerous complaints. For depression of spirits, incapacity for society, study, or business, giddiness, drowsiness, nervousness, and insanity itself, when arising from or combined with urinary diseases, they are unequalled. Price 1*s.* 1½*d.*, 2*s.* 9*d.*, 4*s.* 6*d.*, 11*s.*, and 33*s.* per Box, through all Medicine Vendors, or sent (free) on receipt of the amount in postage stamps, by Dr. DE ROOS, 35, Ely Place, Holborn, London. At Home for consultation daily from 11 till 1, and 5 till 8, Sunday excepted. Advice and Medicines, 1*l.*

THE EAST INDIAN ANTI-NERVOUS PILLS, a cure when all other means fail for Nervous Debility, Lowness of Spirits, Loss of Memory, Head-ache, Dimness of Sight, Fear, Blushings, Tremblings, Melancholy Thoughts, Rheumatic Pains in any part of the body, Urinal Diseases, Constitutional Wasting, &c.

Mr. ROBERTS, late Army Surgeon, discovered these Pills during his residence in India, testing their curative powers for years. In his own private practice, in numbers of hopeless cases, never failing to produce ease of body and tranquillity of mind in one or two days, and ultimately effecting a permanent cure.

Price, 1*s.* 1½*d.*, 2*s.* 9*d.*, 4*s.* 6*d.*, 11*s.*, and 33*s.* per box. Sent post free to any part upon receipt of postage stamps or Post-office order for the amount. Address J. ROBERTS, Surgeon, Hall Square, Yarmouth, Norfolk. Advice and Medicine for every form of disease sent to any part.

Price 3*s.* 6*d.* (post free),

POPULAR SCIENCE.

NEW WORK BY PROFESSOR JOHNSTON.

THE CHEMISTRY OF COMMON LIFE. By JAMES F. W. JOHNSTON, M.A., F.R.SS. L. & E., &c., Author of "Lectures on Agricultural Chemistry and Geology," "A Catechism of Agricultural Chemistry," &c.

It is the object of the author to exhibit in this work the present condition of chemical knowledge and matured scientific opinion upon the subject it treats of; the reader will not be surprised, therefore, should he find in it some things which differ from what is to be found in other popular works already in his hands or on the shelves of his library. It will be issued in Monthly Numbers in the following order:—

1. The Air we Breathe; The Water we Drink.
2. The Soil we Cultivate; The Plant we Rear.
3. The Bread we Eat; The Beef we Cook.
4. The Beverages we Infuse.
5. The Sweets we Extract; The Liquors we Ferment.
6. The Narcotics we Indulge in.
7. The Odours we Enjoy; The Smells we Dislike.
8. What we Breathe and Breathe for; What, How, and Why we Digest.
9. The Body we Cherish. The Circulation of Matter, a Recapitulation.

Nos. 1 and 2 are published, price Sixpence each.

WILLIAM BLACKWOOD & SONS, Edinburgh and London.

This day is published in one handsome quarto volume, beautifully bound in cloth, price 21*s.*,

DOUBLE ITALIAN TUBEROSES.

DAWE, COTTRELL, AND BENHAM (successors to FREDERICK WARNER), have just received their Annual Importation of the above, in excellent condition, which they offer at 3*s.* 6*d.* per dozen, with the usual allowance to the trade. Their wholesale Lists of Garden, Agricultural, and Flower Seeds are ready, and may be obtained on application.

3, Lawrence Pountney Lane; and 36, Moorgate Street, London.
Established 28, Cornhill. 1720.

SUPERB DOUBLE HOLLYHOCKS.

WILLIAM CHATER has now ready a fine healthy stock of young plants of all the leading sorts. For price and description see General List, which also contains hints on their culture, with observations on the exhibition of Hollyhocks, &c. &c., and may be had by inclosing a postage stamp.

Saffron Walden Nursery, January 21.

SEEDS.

W. AND S. GAINES beg to offer to Gardeners, Farmers, and Nurserymen, the following seeds:—WHITE SPANISH ONIONS, 4*s.* 6*d.* per lb.; Deptford do., 4*s.* 6*d.* per lb.; Reading do., 4*s.* per lb.; quantities not less than 1 lb. SCARLET RUNNERS, 21*s.* per bushel; quantities not less than one peck. GOOD RHUBARB PLANTS: Albert, Linnæus, and Victoria, 40*s.* per 100; 6*s.* per dozen. Also collections of ANNUAL FLOWER SEEDS, packets of 6 varieties, 10*s.*, 30 do., 5*s.*; 15 do., 2*s.* 6*d.*—Post-office orders payable to W. & S. GAINES, Covent Garden Market, London.

ROSES.

A. PAUL AND SON can still supply good plants of most of the fine new and popular sorts, either as Dwarfs or Standards. Priced Descriptive Catalogue forwarded free by post for two stamps.—Nurseries, Cheshunt, Herts, Jan. 28.

JUDSON'S
RICHMOND VILLA BLACK HAMBURGH VINE.

ARTHUR HENDERSON AND CO. have the pleasure of informing their patrons and friends that they have good plants of this valuable and much-esteemed Vine at 5*s.* each; extra strong plants, 7*s.* each.—N.B. For full particulars of the distinguishing characteristics of this Vine, we beg to refer our customers to the *Gardeners' Chronicle* of October 25th, 1851.

SUTTON'S COMPLETE COLLECTIONS OF KITCHEN GARDEN AND FLOWER SEEDS may still be obtained, as see last week's *Gardeners' Chronicle*.—JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

MYATT'S VICTORIA RHUBARB.—For Sale, 4000 VICTORIA (true) RHUBARB ROOTS, in lots, to suit purchasers. Price on application.—Address JOHN SCHOFIELD & SON, Seedsmen, &c., Knowsthorpe, near Leeds, Yorkshire.

THE EARLIEST PEA is "FAIRHEAD'S EARLY CONQUEROR." To be had of CLARKE AND CO., Borough, London; 2*s.* per quart (price per bushel on application).

J. G. WAITE begs to return thanks to his friends and purchasers of the DANIEL O'ROURKE PEAS, and to inform them and the public generally, that on account of the extraordinary demand for this valuable Pea, he will not be able to supply any more this season.

J. G. W. will be ready to supply seed of this year's crop in the months of July and August.—181, High Holborn, London.

CORNWELL'S VICTORIA RASPBERRY; unequalled for size, flavour, and brightness of colour—containing more juice than any other, and an abundant bearer. The certificate of merit has been awarded to them at all the principal metropolitan shows; the fruit also sells for more than any other at Covent Garden Market. Canes of the above to be had of GEORGE CORNWELL, Market Gardener, Barnet, at 15*s.* per 100. The usual allowance to the trade.

"NORFOLK HERO" CUCUMBER.—Without exception the very best Cucumber for open ground cultivation that has yet been offered. It is a most prolific bearer, as handsome as any frame variety, and is delicate in point of texture, the fruit measuring from 16 to 20 inches in length. It is in the sole possession of YOUELL and Co., who will forward per post free (on receipt of postage stamps) packets containing six Seeds, 1*s.*; 18 seeds, 2*s.* 6*d.*—"To Market Gardeners the above will be found a great acquisition."

Royal Nursery, Great Yarmouth.

THE FINEST BALSAMS IN EUROPE, in Six Classes; Seed saved by Mr. GLENNY from flowers three inches across: the six, 37 stamps; Mixed Seeds, 13 stamps, in Sealed Packets only, signed and sealed. The finest seeds that can be had procured to order, and all other choice Horticultural subjects.—420, Strand.

TO FARMERS.

IN ACCORDANCE with the wishes of Farmers, Millers, and others interested in the Corn Trade, an Edition of the AGRICULTURAL GAZETTE AND GARDENERS' CHRONICLE will be published every Monday Afternoon, in time for post. The Monday's Edition will, in addition to the usual markets, contain a full report of the Mark Lane, Smithfield, and Newgate Markets of the day.—May be ordered of any Newsagent. Price 6*d.*

A BEAUTIFUL ORNAMENT FOR THE DRAWING-ROOM.

THE DOUBLE LILY OF THE VALLEY is universally admired, on account of its delicious Fragrance, Elegant Flowers, and Graceful Habit; as a pot plant it is superior to any flower in cultivation, its hardy nature also renders it a suitable ornament for the open garden. One dozen Roots, with directions for their culture, sent free by post on receipt of 36 postage stamps.—JOHN J. REID, Monkton Nursery, Ryde, Isle of Wight.

RANUNCULUSES.

H. GROOM begs to say that his Catalogue will be forwarded by post on application.—Foreign Orders executed.

THE PLANTING SEASON.

FRANCIS AND ARTHUR DICKSON AND SONS respectfully invite the attention of Planters to their very extensive Stock of Forest and Ornamental Trees, Evergreens, and Flowering Shrubs, Fruit Trees, Roses, Herbaceous and Alpine Plants, Stove and Greenhouse Plants, &c., growing at their Upton Nursery Grounds, near Chester. The Nurseries lying high and exposed, the whole of their Plants are hardy and well-grown, and having been regularly transplanted are also well rooted, and cannot fail to give satisfaction.

The following Lists are published, and will be forwarded on application:—Forest and Ornamental Trees and Shrubs, Fruit Trees (Descriptive Catalogue), Roses (Descriptive Catalogue), Herbaceous and Alpine Plants, Stove and Greenhouse Plants, Dahlias, Bedding-out Plants, Florists' Flowers, &c.

☞ It being necessary to clear the plants off certain portions of their Grounds before the end of March, F. & A. D. & SONS will dispose of this part of their Stock at much reduced prices, rather than incur the expense of removing them to other parts of their Nurseries.—Upton Nurseries, Chester, Jan. 28.

NEW AND SUPERIOR SEEDS.

FRANCIS AND ARTHUR DICKSON AND SONS, respectfully intimate that their CATALOGUE OF VEGETABLE AND FLOWER SEEDS, &c., for the present season is published, and will be forwarded on application. Their Stock of NEW SEEDS is now complete, and as each article has been procured direct from the most particular and careful growers, they feel satisfied that the quality of their Seeds is such as cannot fail to merit the approbation of their customers and friends.

F. & A. D. & SONS further beg to assure their patrons that everything supplied by them shall be of the first quality; and that all orders entrusted to them shall be executed with fidelity and despatch.

Seed Warehouses, 106, Eastgate Street, Chester, and 14, Corporation Street, Manchester.—Jan. 28.

DISSOLUTION OF PARTNERSHIP.

THE PARTNERSHIP which has existed for thirty-five years between my cousin and myself, as Seed Merchants and Nurserymen in this City, under the firm of "FRANCIS AND JAMES DICKSON," and also in Manchester for upwards of four years, under the firm of "FRANCIS AND JAMES DICKSON AND CO.," has been this day DISSOLVED by mutual consent; and I beg to tender my grateful acknowledgments and sincere thanks to the numerous patrons and friends of the late firm, for the kind and liberal patronage extended to my late partner and myself for so many years, and as I have now entered into Partnership with my Sons, I venture to hope that we may, unitedly, continue to merit a share of that confidence and patronage which I enjoyed for so long a period as senior partner in the late firm.

Our Seed Business will be carried on in the same premises as before, and our Nursery Business at the Upton Nurseries near Chester, under the firm of FRANCIS and ARTHUR DICKSON & SONS.

Chester, Dec. 28, 1853. FRANCIS DICKSON.

SEED WAREHOUSE, 106, EASTGATE STREET.

FRANCIS and ARTHUR DICKSON AND SONS, in soliciting a continuance of the confidence and patronage enjoyed by the late firm, have only to state that they are determined that every article sent out by them, whether in Seeds or Plants, shall not only be of first quality but shall also be charged the most moderate price; and they further assure their customers and friends that no effort shall be wanting on their part at all times to meet the wishes of those who entrust their orders to them. Their stock of New Seeds for the ensuing season is now complete; catalogues of which will be ready in a few days, and may be had on application.—January 28.

EXOTIC NURSERY, CANTERBURY.

WILLIAM MASTERS, at the commencement of a new season, has the pleasure to tender his very grateful thanks to his numerous Patrons for the very kind support with which they have favoured him during the last thirty-five years, and begs to solicit a continuance of the same on behalf of himself and his Son, with whom he has now entered into PARTNERSHIP, and who has been engaged with him in the practice of Landscape Gardening and the various branches of his business for some years.

WILLIAM MASTERS AND SON beg to offer the following Collections of GARDEN SEEDS, in assortments containing a supply for the whole year in proportionate quantities of each.

No. 1 Collection, for a large garden, containing 20 quarts of Peas in 20 best sorts for succession, 10 best sorts of Broccoli, 8 ditto of Lettuce, with all other vegetables in proportion	£2	10	0
No. 2, the best new and other sorts, in smaller quantities	1	10	0
No. 3, ditto ditto	1	0	0
No. 4, a Collection of esteemed kinds for a small garden	0	10	0

Grass Seeds for Lawns, Permanent Pasture, or alternate Culture.

FLOWER SEEDS, with printed Directions for their Culture, in Collections of 12 for 2s. 6d.; 25 for 5s.; 50 for 9s.; 100 for 18s.

Their New Seed Catalogue for 1854 will be forwarded on application.—January 28, 1854.

TO NOBLEMEN, GENTLEMEN, AND COMPANIES PLANTING.

THOMAS JACKSON AND SON respectfully invite an inspection of their extensive and fine collection of ORNAMENTAL SHRUBS and TREES; they are of fine growth, and in excellent condition for planting for immediate effect. To the undernamed T. J. & Son especially desire attention. Prices may be obtained by letter or personal application.

American Arbor-vitæ, 2 to 10 ft.	Deutzia gracilis, 1 to 2 feet, fine
Chinese do., 2 to 8 feet, fine	Pinus excelsa, 3 to 8 feet, fine
Arbutus, 2 to 5 feet	Pinus insignis, 3 to 5 feet
Aucubas, 2 to 4 feet, very bushy	Cryptomeria japonica, 2 to 6 ft.
Cedar, Deodar, 2 to 12 feet, fine	Taxus pyramidalis, 2 to 6 feet, fine
Cedar of Lebanon, 2 to 9 ft., fine	Laurustinus, 1 to 3 feet, very bushy
Variegated Hollies, 2 to 9 feet	Evergreen Oaks, 2 to 7 feet, fine
Green do., 2 to 9 feet	Portugal Laurels, 2 to 5 feet
Weeping do., 5 feet stems, fine	Magnolia acuminata, 4 to 10 ft.
Berberis aquifolium, 2 to 3 feet, bushy	Do. grandiflora Exmouth, 2 to 5 feet, fine
Taxodium sempervirens, 3 to 12 feet, fine	Tree Pæonies, 1 to 3 ft., bushy
English Yews, 2 to 9 feet	Chinese Junipers, 2 to 8 ft., fine
Irish do., 2 to 8 feet, very fine	Upright Cypress, 5 to 8 ft., fine
Tree Box, 2 to 7 feet	Forsythia viridissima, 2 to 4 ft.
Araucaria imbricata, 1 to 5 feet, fine	Red Cedars, 3 to 5 feet, fine

T. J. & Son having added to their previously good stock of American Plants, about one-third of the entire stock of the Norbiton Nursery, so long famed for its collections of Hybrid Rhododendrons, Azaleas, &c., can now offer on most advantageous terms—

Rhododendron ponticum, 1 to 5 ft., in great variety.
Do. aureum, and the varieties of yellows, 1 to 7 ft.
Do. Smithi, tigrinum, and other scarlets, 1 to 9 ft.
Do. campanulatum and light varieties, 1 to 7 ft.
Azaleas, Indian, American, and Ghent varieties, 1 to 6 ft.
Kalmia latifolia, and others, 1 to 4 ft.

T. J. & Son have a splendid healthy stock of the Sikkim Rhododendrons, of which they will furnish the 12 following fine kinds, in pots, for 63s., viz., Thompsoni, fulgens, glaucum, glaucum nanum, niveum, Falconeri, ciliatum, Edgeworthi, lancifolium, cinnabarinum, ferruginosum, and calycatum.

Fine Fruit and Forest Trees; strong Quick for Fences, and all other kinds of Nursery Stock.—Nurseries, Kingston, near London.

CUCUMBER SEED.

SAGGS'S "ROYAL EXHIBITION," a hybrid between the Scotch Hero and Mills's Jewess. It was awarded Two First Prizes at the Stamford Hill Show; One First Prize at the Surrey Gardens; and has been exhibited at 21, Regent Street, and very highly commended. It is considered by Nurserymen and Gardeners who have seen it to be the best Cucumber yet let out. Jet-black spine, good bloom, 18 inches to 24 inches long. In packets of six seeds, 2s. 6d. To be had of Messrs. HURST & M'MULLEN, Leadenhall Street; Messrs. CHARTRES, King William Street; Mr. SOLOMON, and Messrs. HOOPER & Co., Covent Garden; Messrs. PAUL, Cheshunt; Mr. FRANCIS, Hertford; and of the grower, WILLIAM SAGGS, High Hill Ferry, Upper Clapton, London. Postage stamps to the amount will be taken in return.

COLE'S SUPERB CRYSTAL WHITE CELERY.

J. THORNLEY, W. COLE, AND CO., NURSERYMEN, SEEDSMEN, and FLORISTS, Withington, Manchester, beg to announce that they are now prepared to supply this fine Celery at 1s. 6d. per half-ounce packet, or in larger quantities. This variety has given universal satisfaction, and has been proved to possess all the good qualities attributed to it by W. Cole last season. It can also be procured from the following agents:—

Messrs. Hurst and M'Mullen, 6, Leadenhall Street; Messrs. Noble, Cooper, and Bolton, 152, Fleet Street; Messrs. Minier & Co., 60, Strand; Messrs. Charlwood & Cumming, Covent Garden; Mr. Turner, Slough; Mr. Duncan Hairs, St. Martin's Lane; Mr. Denyer, Gracechurch Street; Mr. J. Fairbairn, Clapham; Messrs. A. Henderson & Co., Pine Apple Place; Messrs. Downie and Laird, Edinburgh; Messrs. F. & J. Dickson, Chester; Messrs. F. & J. Dickson, Manchester; Messrs. J. & J. Fraser, Lea Bridge, Essex; Messrs. Little and Ballantyne, Carlisle; Messrs. Veitch & Son, Exeter; Mr. J. Veitch, Exotic Nursery, Chelsea; Mr. Clarke, King Street, Covent Garden; Messrs. Finney & Co., Gateshead; Mr. A. Pontey, Plymouth; Mr. E. Rendle, Plymouth; Mr. Cattell, Westerham, Kent; Mr. Smith, Riverhead, Kent; Mr. Epps, Ashford and Maidstone, Kent; Messrs. Lucombe, Pince, & Co., Exeter; Mr. Browne, Norwich; J. Cole, Keyfield Nursery, St. Albans; Garaway & Mayes, Bristol; Drummond & Son, Stirling.

All orders to be addressed as above, instead of to "Dartford" as heretofore.

WHEELER'S SHORT SELECT SEED LIST.

J. C. WHEELER AND SON'S SEED LIST *is now ready, and will be forwarded free on application. We have tried to make it as short and as select as possible, leaving out the names of all inferior varieties, so that it is really a List of the best Seeds in cultivation. Grasses and other Agricultural Seeds, Garden and Flower Seeds, all described, and prices put to every article. We deliver our Seeds Carriage Free to almost every Railway Station in the kingdom, and take especial care that every sort we send out is true to name, and of the best quality.*

J. C. WHEELER & SONS, Seed Merchants, Gloucester.

TO POTATO GROWERS.

W. DRUMMOND AND SONS, SEEDSMEN and NURSERYMEN, Stirling, N. B., offer for sale several tons of ROS'S EARLY AMERICAN POTATOES, grown expressly for seed, on reclaimed peat or moor, and without manure. Not a trace of disease could be seen in the crop. The Potato has been well known in Scotland for the last 40 years, as one of the very best for general garden or field crops. It is very productive, full sized, dry, and finely flavoured; and is earlier than the Regent.

Price 22s. per sack of 2 cwt., sack included, and delivered carriage free in London, Liverpool, and Hull.

Unknown correspondents will please send a remittance with their orders.

May be had on application, a very useful priced Descriptive CATALOGUE of VEGETABLE SEEDS, containing only such varieties as are really worth cultivating.

HAWKES' CHAMPAGNE RHUBARB.—This most desirable variety is now for the first time offered to the public. It has stood the severest test that can be applied, and has beaten everything in Covent Garden and other London Markets in realising higher prices, from its magnificent colour and size. It has been seen by the very highest authorities and pronounced to be a most valuable introduction. In earliness it equals the Prince Albert, but of a deeper colour, and much greater bearer. It forces remarkably well, and is very hardy out of doors. Mr. HAWKES has placed the entire sale in the hands of Duncan Hairs.

One-year-old plants, strong, 5s. each. A few two years old, very strong, for sale.

LAING'S MAMMOTH RED CELERY.—This is considered the largest yet grown, attaining the extraordinary weight of from 10 to 12 lbs., and at the same time perfectly solid. It is nearly perennial in its habit, as it will not, under any circumstances, run to seed the first season, and it is difficult sometimes the second when planted out for that purpose. In colour it is a bright red. In flavour unsurpassed, if equalled.

It has been seen growing by many practical gardeners, who deem it a new feature in the garden, from the fact that it may be had nearly all the year. Packets 2s. 6d. each.

MITCHELL'S HARDY EARLY CAULIFLOWER.—This is grown precisely as the handglass variety, but when removed from the frame does not require the same protection, and comes in immediately after. This is particularly recommended for gentlemen's establishments. The head is not large, but handsome and compact, and is so firm that you may let them stand from 10 days to a fortnight and they will not get frothy or loose. This is quite a distinct variety. Packets 2s. 6d. each.

DUNCAN HAIRS, Seedsman, 109, St. Martin's Lane. Post Office orders to be made payable at Charing Cross.

STRAWBERRIES!—FOUR NEW & DISTINCT VARIETIES.

NICHOLSON'S AJAX.—Very large and handsome, most exquisite flavour, unequalled as a Dessert Fruit, and forces well.

NICHOLSON'S RUBY.—Medium size, excellent quality, and an immense bearer, producing a succession of fine fruit for an unusually lengthened period, also a good forcer.

NICHOLSON'S CAPTAIN COOK.—A first-rate market fruit, colour scarlet, very large size, great bearer, and bears carriage well. Plants remarkably strong and hardy.

NICHOLSON'S FILL-BASKET.—Nothing can surpass this fine sort as a market fruit, in colour it is a very bright scarlet, general shape round, gets very large, but never out of shape; excellent for preserving, a tremendous bearer, and will bear carriage a great distance. Plants very robust and healthy.

These splendid Strawberries have been admired by all who have seen them; the two first for their surpassing excellence as Dessert Fruit, the two latter for their size, colour, abundance, and other good qualities as market fruit.

Gentlemen, Amateurs, and Market Gardeners wishing to possess these valuable Strawberries can now be supplied with well rooted plants, by WILLIAM NICHOLSON only, at 15s. per 100; or 25 each of any two sorts for 10s., box included.

Post-office orders payable at Yarm, Yorkshire, or cash expected with the order.

Testimonials have been received from some of the principal horticulturists in the kingdom, which will be forwarded to any person on application.—Egglescliffe, near Yarm, Jan. 28.

AMERICAN PLANTS.

JOHN WATERER begs to announce that his NEW CATALOGUE of RHODODENDRONS, AZALEAS, CONIFEROUS PLANTS, &c., is now published, and may be had by enclosing two stamps for postage.

The colours of all the Rhododendrons worthy of cultivation are described in order to facilitate purchasers in making selections, together with a Treatise on their successful management.

☞ The Rhododendrons forming the American Exhibitions in the Royal Botanic Society's Garden, Regent's Park, London, are annually supplied from this establishment.

The American Nursery, Bagshot, Surrey, near the Farnborough Station, South-Western Railway, and 3 miles from Blackwater, South-Eastern Railway.

CHELTENHAM EXHIBITION, 1854.

TO PARTIES ABOUT TO ERECT CONSERVATORIES OR PUBLIC EXHIBITION ROOMS.

TO BE SOLD.—At the end of July, the BUILDING now constructing in Cheltenham for the Crystal Palace Exhibition of Horticulture will be disposed of either in one or more Lots, to suit the convenience of Purchasers. It will comprise 20,000 superficial feet of Lights, in sizes suitable for Conservatories, Greenhouses, &c., made of the very best materials, and glazed with 16 oz. Sheet Glass. Parties contemplating the Erection of Exhibition Rooms or Greenhouses and other Garden Works, will find this a rare opportunity for providing themselves with the most expensive portions of such undertakings at a low price.—Applications to be made to Mr. G. PARSONAGE, Builder and Undertaker, Cheltenham.

TO NURSERYMEN, ETC.

TO BE SOLD, at a very low price, 500 RUSSIAN MATS. May be inspected at 6, Campden Mews, Kensington.

TO NURSERYMEN, FLORISTS, & OTHERS.

TO BE SOLD, a NURSERY GROUND, containing 1½ acre of Land with Stock, Green and Hot-houses, Cottage, &c., surrounded by respectable residences, near London. Held on Lease for 80 years at a Ground Rent.—Particulars to be had of Mr. GEORGE SMITH, Auctioneer, Surveyor, and Land Agent, 3, Philpot Lane, City, London.

DENYER'S NURSERY, celebrated for ROSES, &c., Established 26 years, consisting of Five Acres of Land, House and Seed Shop attached, of which a 14 years' Lease will be granted. The Proprietor being about to retire, is desirous of offering the above, as an opportunity that rarely occurs to the trade, with a first-rate ready-money connexion, and the Stock to be taken at a valuation, two-thirds to be paid on taking possession; time will be given to pay the balance. No Goodwill is expected.—Apply to Messrs. PROTHEROE & MORRIS, Leytonstone, Essex; or Mr. E. DENYER, on the premises, Loughborough Road, within three miles of London.

TO BE SOLD, a SEED BUSINESS in one of the principal towns in the North of England. The premises are situated in the best business part of the town, are extensive and calculated for carrying on a large trade.—For further particulars, or to treat, apply, with real name and address, to A. Z., Office of this Paper. N.B. A Nursery Stock may also be had at a valuation, if desired.

TO BE SOLD, a splendid BLACK PEACOCK, 3 years old; also a pair of common coloured and same age.—Apply to Mr. M. TRUMPER, Tenbury.

CLEAR BUFF COCHIN CHINA FOWLS' EGGS may be had of Mr. GILBERT, Wine Merchant, Grays, Essex, from Hens bred by Thomas Sturgeon, Esq., in 1852, and reserved for stock at 16s. per dozen. They are unequalled for beauty, plumage, short legs, and great weight, with perfect clear golden hackle, and many of them falcon hockled. Also 50 very splendid first-class PULLETS for sale, nearly all clean in hackle. May be seen at any time.

Sales by Auction.

PRIZE POULTRY.

MR. J. C. STEVENS is instructed by John Fairlie, Esq., of Cheveley, to announce for sale by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, 31st January, 1854, at Twelve o'Clock precisely, a selection from his renowned Yard of Poultry, consisting of FIRST CLASS COCHIN CHINA, DORKINGS, BRAHMA POOTRAS, SCOTCH DUMPIES, &c., including many of his Prize Birds.—Catalogues, by enclosing a stamped directed envelope to Mr. J. C. STEVENS, 38, King Street, Covent Garden.

TO NOBLEMEN, GENTLEMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. Cutbush, to Sell by Auction, on the premises, Barnet Nurseries, Middlesex, on THURSDAY, Feb. 9th, at 11 o'clock, without reserve, in consequence of a portion of the land being purchased by the Magistrates of the County of Middlesex for the erection of stores for the militia, the whole of the NURSERY STOCK growing on the two acres, consisting of Ornamental Fruit and Forest Trees, Evergreens and Deciduous Shrubs, Standard and Climbing Roses, Box Edging, &c.—May be viewed prior to the Sale. Catalogues may be had on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

A CONSIGNMENT FROM GHENT, FROM A CELEBRATED GROWER, FOR ABSOLUTE SALE.

MESSRS. PROTHEROE AND MORRIS will sell by Auction, at the Mart, Bartholomew Lane, on THURSDAY, February 2, at 12 o'clock, about 400 Double Camellias, 300 Indian and Ghent Azaleas, well set with bloom buds; also 300 Rhododendron Arboreum, 500 Gladiolus Gandavensis, with 500 Standard and Dwarf Roses.—May be viewed the morning of sale; Catalogues had at the Mart; and of the Auctioneers, American Nursery, Leytonstone, Essex.

LAMBETH.

TO NOBLEMEN, GENTLEMEN, AND THE TRADE.

MESSRS. PROTHEROE AND MORRIS are instructed by Messrs. Hay, Sangster and Co. to Sell by Auction, on the Premises, Pleasant Place, West Square, Lambeth, without the least reserve, on MONDAY, February 6th, at 11 o'clock, the whole of the NURSERY STOCK, consisting of Dwarf Trained and Untrained Peach, Nectarine, Apricot, Standard and Dwarf Apple, Pear, Plum, Cherry, China Arbor-vitæs, and Evergreen Oaks, in pots, 2 to 5 feet; Green and Variegated Holly, 3 to 7 feet; Aucuba Japonica, Arbutus, 1 to 3 feet; Cypress, 4 to 6 feet; Common Laurels, 3 feet; Filberts, Gooseberries, Currants, Raspberries, Weeping Elms, Willows, and Ash, Standard and Dwarf Roses, Bedded Pear Stocks, Seakale, and Giant Asparagus, Vines in pots, Box Edging, Sangster's New Early Scarlet Rhubarb (Prince of Wales), which no garden should be without; also the large Stock of thrifty grown Standard Dwarf and Dwarf Trained Mulberries, for which Messrs. H. S. and Co. have been so justly celebrated. A large quantity of rotten Dung, &c.—May be viewed prior to the sale; Catalogues may be had (6d. each, returned to purchasers) on the premises; of the principal seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

PEAS! PEAS! THE BEST VARIETY IN CULTIVATION.

CHAMPION OF ENGLAND, a blue wrinkled Pea, very productive, of quick growth, and of a most delicious flavour. This extraordinary Pea combines in one the merits of all others, and has none of their demerits; for, although a wrinkled Pea, it is both hardy and early, and being of quick growth, it is the best kind to plant throughout the season for each crop. It is highly productive, bearing very long pods of a lively green, which are well filled, and the Peas are generally as large as small horse Beans, of a deep green colour, and beyond all others of a most delicious flavour. Height, 3 ft. to 3½ ft.

Price, in quantities of not less than 1 peck ... Bag included 6*s.*
,, ,, ,, 1 bushel ... ,, 16*s.*
,, ,, ,, 1 sack (4 bushels) ,, 60*s.*
,, ,, ,, 8 bushels (1 qr.) ,, 106*s.*

Delivered, freight paid by Railway to London.

Orders, with remittance or satisfactory reference, will have immediate attention on application to

H. AND A. WALLIS, SEEDSMEN, Ipswich.

PAUL'S EARLY DWARF PROLIFIC PEA.—

This Pea having proved itself one of the best early dwarf varieties, A. PAUL & SON have pleasure in offering it this season at 2*s.* per quart. May be obtained of them, or from Messrs. Noble & Co., 152, Fleet Street, and from Messrs. Hurst & McMullen, 6, Leadenhall Street, London.

N.B. A general assortment of Agricultural and Horticultural Seeds of the best quality and most approved races, at London prices. Catalogues free by post on application.

Nurseries, Cheshunt, Herts, Jan. 28.

DILCOCK'S BRIDE BROCCOLI.

BAINBRIDGE AND HEWISON (late Jas. Edward), have the pleasure of again offering to their friends and the public their DILCOCK'S BRIDE BROCCOLI, at 2*s.* 6*d.* per packet, each containing 1300 Seeds; and while returning their thanks to their numerous patrons of last season, they beg to refer them to the following extract, taken from the *Yorkshireman* newspaper of the 30th of April last, when it was exhibited at York, for the fourth time:—"Mr. Dilcock deservedly obtained all the three prizes for Broccoli with his seedling—the 'Bride.' Taking the season into account, these vegetables were really remarkable specimens." It was equally successful the two previous years.

B. & H. are prepared to send out their Catalogues of Kitchen Garden and Flower Seeds, post free, on application, and also their Catalogue of Plants early in March, containing Stove, Greenhouse, &c., including many of the newest and choicest of the season. Their Seeds will be of the very best quality, and in the greatest possible variety.

Sold Wholesale by NOBLE, COOPER, & BOLTON, Fleet Street; CHARLWOOD & CUMMING, Covent Garden; and by all respectable Seedsmen in town and country.—York Nurseries, Jan. 28.

CUCUMBERS, MELONS, &c., the best varieties in Cultivation:—

CUCUMBER SEED—Captivation, 2*s.* 6*d.* per packet; Phenomenon, 2*s.* 6*d.*; Victory of Bath, 1*s.*; Lord Keyuon's Favourite, winter Cucumber, 2*s.* 6*d.*; Gordon's White Spine, 1*s.*; Chamberlain's Essex Hero, 2*s.*; Sunderlandwick, 2*s.*; Hunter's Prolific, 1*s.*; and numerous others at 1*s.* per packet.

MELON SEED, at 1*s.* per packet—Incomparable, Bromham Hall, Golden Ball, Queen, Bowood, Victory of Bath, Camerton Court, Beechwood, Windsor Prize, Emperor, Fleming's Trentham Hybrid, Hampton Court, Blackhall's Green Flesh, Bailey's, and numerous others at 1*s.* per packet.

A packet of each of the first-named Cucumbers, and two packets of either of the Melons named, sent free for 60 stamps.

SUPERB HOLLYHOCK SEED, 2*s.* 6*d.* per packet.—GERMAN ASTER SEED (very fine and double), 1*s.* per packet.—ANTIRRHINUM SEED (splendid), 1*s.* per packet.—For further particulars respecting the before-mentioned Seeds see this Paper of the 21st inst.

A remittance must accompany every order by cash, or penny postage stamps, when the whole or any part of the above will be sent immediately, postage and package free.

EDWARD TILEY, NURSERYMAN, SEEDSMAN, & FLORIST,
14, Abbey Church Yard, Bath.

PYRAMIDAL PEAR TREES ON THE QUINCE STOCK.

J. AND J. FRASER, NURSERYMEN, Lea Bridge Road, Essex, beg to offer the above in fine strong trees, and such as would fruit the first and second year after planting, at the undernamed prices. These Pears are remarkable for their compact style of growth and prolific bearing; the collection comprises the following fine sorts:—Beurré d'Amanlis, Beurré d'Aremberg, Beurré de Capiaumont, Beurré Diel, Beurré Easter, Beurré Grise d'Hiver, Nouveau, Beurré Rance, Williams's Bon Chretien, Crassane, White Doyenné, Duchesse d'Angoulême, Forelle or Trout Pear, Glout Morceau, Hacon's Incomparable, Jargonelle, Louise Bonne of Jersey, Marie Louise, Napoleon, Winter Nelis, and Passe Colmar.—Price 2*s.* 6*d.* to 3*s.* 6*d.* each.

SUPERB LATE WHITE BROCCOLI—"EMPEROR."

EDMUND PHILIP DIXON having purchased the entire stock of the above Broccoli of Messrs. Elletson, Market Gardeners, Thorngumbald, near Hull, begs to announce that he is prepared to send it out in sealed packets at 2*s.* 6*d.* each. This Broccoli has been raised by the Messrs. Elletsons, the raisers of the Mammoth, sent out some time ago, who state that the EMPEROR, if sown at the same time, will come into use before it. Is of very dwarf growth, perfectly hardy, with heads from 15 lbs. to 20 lbs. weight; keeps its colour, and stands firm three weeks after it is ready to cut. A noble flower and commands the best price of any other in the Hull market, where it is well known, and will be a great acquisition to the market gardeners around London, as well as those who wish for a first-rate Broccoli.

May be had of Messrs. NOBLE, COOPER, & BOLTON, 152, Fleet Street; and Messrs. HURST & M'MULLEN, 6, Leadenhall Street, London. Also of the Advertiser, 57, Queen Street, Hull.

THE BEST DESCRIPTIVE SEED LIST

YET PUBLISHED IS THAT OF

RICHARD SMITH, NURSERYMAN and SEEDSMAN, Worcester, of whom it may be had GRATIS on application.

RICHARD SMITH'S SEED LIST for 1854 contains full particulars of his COLLECTIONS of GARDEN SEEDS.

	£	s.	d.
No. 1 contains 20 QUARTS of the best garden PEAS for succession, with full quantities of EVERY OTHER VEGETABLE for a year's supply of a large garden, price	3	0	0
No. 2 a smaller collection of equally choice sorts ...	2	0	0
No. 3 do. do. in reduced quantities ...	1	0	0
No. 4 50 sorts of the SHOWIEST AND BEST FLOWER SEEDS, with descriptive labels to each, post free	0	10	0
No. 5 36 do. do. do. do.	0	7	6
No. 6 24 do. do. do. do. do.	0	5	0

Any alteration of equal value that may be wished in the sorts or quantities intended for these Collections will be willingly made by RICHARD SMITH, Nurseryman and Seedsman, Worcester.

CORN MARKET, WISBEACH, CAMBRIDGESHIRE.

CHARLES SHARPE begs to call the attention of the nobility, gentry, and trade to the undermentioned choice collection of SEED POTATOES, grown with great care upon marsh land near the sea, which is the most appropriate soil for the culture of the Potato, as it is less affected by the disease, and of finer quality. The undermentioned prices include hampers and package. Smaller quantities can be had if required. The Trade Price can be had on application.

POTATOES (FOR FORCING AND EARLY PLANTING).

Per bushel of 4 stones.		Per bushel of 4 stones.	
Early Ash-leaf Kidney ...	12*s.*	Early Flourball (Rylott's)	12*s.*
,, ,, (Jackson's)	12*s.*	,, Round Frame ...	12*s.*
,, Emperor	12*s.*	,, Cockney	12*s.*
,, Fox's Seedling ...	10*s.*	,, Oxford (very true)...	12*s.*

POTATOES (FOR SECOND PLANTING AND LATE CROP).

Per bushel of 4 stones.		Per bushel of 4 stones.	
American Native ...	10*s.*	Kentish Kidney	8*s.*
White Rough	8*s.*	White Kidney	8*s.*
Yorkshire Regent... ...	8*s.*	British Queen (this is the largest producer and best quality in cultivation) ...	12*s.*
Forty Fold	10*s.*		

SEEDS—CARRIAGE FREE.

WILLIAM E. RENDLE AND CO. *have, from the very extensive patronage they have received, been induced this season to offer the following liberal arrangement to all who purchase Seeds from their establishment.*

ALL ORDERS ABOVE £5 WILL BE DELIVERED CARRIAGE FREE TO ANY RAILWAY STATION IN ENGLAND OR WALES, AND TO ANY STEAM PORT IN ENGLAND, WALES, IRELAND, OR SCOTLAND.

Two or three purchasers joining together will therefore have the advantage of having their orders delivered free of any cost for carriage.

RENDLE'S PRICE CURRENT FOR 1854 should be obtained by all who have gardens, or who take an interest in the cultivation of the soil.

NEW SEEDS—GROWTH OF 1853.

RENDLE'S COLLECTION OF GARDEN SEEDS, FOR ONE YEAR, *will be sent out as usual by the Subscribers.*

The collections have given universal satisfaction, and they will be found sufficient to supply a garden during the whole of the 12 *months.*

	£	s.	d.
No. 1.—A complete Collection, to supply a large garden for 12 months, including 20 quarts of the newest and most approved Peas, for early, medium, and late crops; 10 quarts of Beans, and full quantities of all other kinds of vegetable seeds	3	0	0
No. 2.—A complete Collection, in reduced quantities, for a smaller garden	2	0	0
No. 3.—A complete Collection do.	1	5	0
No. 4.—A small and choice Collection	0	15	0

For the detailed quantities contained in the No. 1 *Collection, see back page Gardeners' Chronicle, Jan.* 7, 1854.

☞ *All orders above* 20*s. carriage free (see* PRICE CURRENT), *and all orders above* 5*l. delivered carriage free to every Railway Station in England and Wales, and to every Steam Port in England, Wales, Ireland, and Scotland.*

WILLIAM E. RENDLE & Co.,
Seed Merchants,
ESTABLISHED 1786. Plymouth.

The quantities contained in the above Collections will be found in our PRICE CURRENT AND GARDEN DIRECTORY, *just published.*

CHOICE SEEDS.

BASS AND BROWN'S SPRING CATALOGUE FOR 1854 is now in the Press. The Part containing the SEEDS can be forwarded immediately, on application, for two penny stamps.

PEAS, FINE NEW KINDS, of last and present year's introduction.

Fairbeard's Nonpareil, earlier than Champion of England, and fine rich flavour	5*s.* 0*d.*	per quart.
Waite's Daniel O'Rourke, very early ...	2 6	,,
Sangster's New No. 1, 2½ ft., very early, prolific and fine pods	2 0	,,
Stuart's Paradise, 4ft., a very fine large long-podded marrow, three weeks before Thurstone's Reliance, or other Peas of the same character	2 0	,,
Hairs' Defiance, 4 ft., a fine new wrinkled marrow	2 0	,,

The three last mentioned were grown last season by ourselves, and we can recommend each as an acquisition. Sangster's No. 1 *and Stuart's Paradise will be included in the collections below.*

BASS AND BROWN'S ASSORTED COLLECTIONS OF VEGETABLE SEEDS, comprising the best in cultivation, including several new sorts of excellent quality.

	£	s.	d.
No. 1.—Collection for a large garden, containing 20 quarts Peas, in 20 best sorts, and all other vegetable seeds in proportion, for one year's supply...	3	0	0
No. 2.—Collection in smaller proportions	2	0	0
No. 3.—Collection do. do.	1	5	0
No. 4.—Collection of good kinds for a small garden ...	0	15	0

Copies of the Autumn Catalogues may still be had for three penny stamps.

Goods (not under 20*s.*) carriage free to all stations in London.

Seed and Horticultural Establishment, Sudbury, Suffolk.

TO THE SEED TRADE.—

As we are constantly receiving from Provincial Seedsmen applications for Wholesale Priced Lists of Seeds, and incur considerable inconvenience in replying to each individually, we beg respectfully to intimate that we grow Seeds *only for retailing, and do not profess to do the wholesale trade,* that being carried on by many highly respectable wholesale houses in London, Edinburgh, and Dublin.

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

PRESENT PRICES OF AGRICULTURAL SEEDS.—

See MESSRS. SUTTON'S DESCRIPTIVE LIST *on the last page of this day's* GARDENERS' CHRONICLE.

The Gardeners' Chronicle.

			Royal Institution	8½ P.M.
SATURDAY,	—	4	Asiatic	2 P.M.
			Medical	8 P.M.

WHEN attempts are made to influence public journalists by anonymous correspondents, a suspicion is inevitably raised as to the motives of the writers. If, in addition, all the resources of ingenuity are put in action to destroy every trace of the authors, whose aim is to deprecate inquiry into abuses in the administration of public affairs, what was before optional becomes a duty, and a journalist is driven to deal with subjects which he might otherwise have passed in silence. Such is the case as regards ourselves and the WOODS and FORESTS. As soon as the last Report of the Commissioners appeared we announced its publication, and begged those who, by their position in society, are guardians of the public interest, to read it carefully. Forthwith some masked agent of the deputy-surveyors, painfully impressed, we presume, with a recollection of the exposure which these gentlemen and their abettors underwent in our columns

some months since, begs us to refrain from further notice of the subject, at least till something or other shall have been said or done in their behalf. Others follow in the same strain, and thus we are forced to the conclusion that the present game of the writers is delay, which we must decline to afford them any longer.

The Blue Book now before us contains the annual reports from Mr. GORE, in charge of the Land Revenues of the Crown in England and Wales, and from Mr. KENNEDY, to whom is assigned the management of the Land Revenues in Scotland and Ireland, and, in addition, all the Woods and Royal Forests. The first, consisting of 116 pages, calls for no remark at present; the second, filling 564 pages, is a document which demands very serious criticism. It has been evident, from the commencement of the proceedings before Lord DUNCAN's Committee, that strenuous efforts would be made in certain quarters to screen the forest officers, and even to make the public believe that their miserable management was the best possible. To effect this object awkward circumstances were dexterously smoothed down; apologetic Reports were carefully prepared by the complaisant agents of the Treasury; where exposure was inevitable a bold face was put upon the matter, and the most discreditable principles of management were audaciously defended. Lord DUNCAN's Committee having done little beyond collecting a mass of complicated evidence laid before Parliament in some huge blue books which it was well known that few would think of reading, the battle was supposed to have been won by the forest officers, who became triumphant. They evidently believed that no further reckoning would be demanded from the present generation. No wonder then that when a new Commissioner was placed over them long trained to public business, active, well informed in rural affairs, deeply sensible of the responsibility of his high office, and resolved to execute it without fear or favour, the forest officers and their friends should have flown to arms, and resolved to thwart by every device in their power the introduction of a system of official management which contrasted disagreeably with that to which they had been accustomed. To admit that the measures of the new Commissioner were right was to undo all that had been so adroitly accomplished, and to stultify themselves in the eyes of the country. The deputy-surveyors were resolved upon not becoming suicides.

It has therefore excited no surprise to find that they hold by their old customs, and that when active opposition was too dangerous they have tried the effects of the *vis inertiæ*. It has clearly been this on which they have relied, hoping, we suppose, that official patience would be exhausted, and that a public disease would be left to itself as soon as it was thought to be incurable. We now find the Commissioner officially reporting that the duties assigned to him by Parliament have been performed "amidst very many difficulties and *obstructions*." Difficulties and obstructions—we beg that the words may be remembered. This is a serious matter. It is officially declared that a great public officer is obstructed in his duty. Obstructed by whom? Let us endeavour to find an answer to so important an inquiry in the papers before us. They tell us, among many other things, that Mr. KENNEDY was till lately in charge of Hainault Forest. In January, 1853, while reporting largely upon it, he expressed his disapprobation of certain estimates of expenditure furnished by Messrs. CLUTTON and DRIVER, the Treasury advisers; refused to recommend such expense to be incurred, declared his conviction that the necessary works could be executed at a considerably smaller cost, and desired that the opinion of Mr. CAIRD or some other competent person should be taken. One would have thought that this was no more than what the commissioner was bound to do. But the hint that Messrs. CLUTTON and DRIVER were not infallible, and that Mr. CAIRD might offer advice more advantageous to the public, seems to have given mortal offence, and on the 24th March Mr. KENNEDY was superseded in the charge of Hainault by Mr. GORE. In the reformation of Chopwell woods there was another struggle, but with a different result; for the opinions of Mr. CLUTTON, upon whom the Lords of the Treasury rely, were disposed of in a masterly report by Mr. BROWN, whose judgment Mr. KENNEDY prefers, we think very naturally, and eventually the Treasury abandoned their ground, authorising Mr. BROWN's more judicious recommendations to be carried out. This happened in February, 1853, just a month before the management of Hainault was taken out of Mr. KENNEDY's hands; can we doubt that the result of Chopwell contributed to that act? Then there is Delamere, the deputy surveyor of which snapped his fingers at the commissioner, defied his orders, and so conducted himself as to render it necessary that he should be removed from his office. Not that he is actually removed; but his unfitness having been publicly declared it is evident that he must be speedily replaced, if his unseen supporters will permit it. In Bere the deputy surveyor has signified his inability to furnish what his forest ought to realise, within about 1150*l.*; and in Parkhurst the same surveyor can produce no more than 2*l.* 16*s.*! while Mr. BROWN estimates the place to be capable of yielding 313*l.* As to Dean, the people would neither fell their trees before they stripped them, nor cure their bark as they were directed.

We have no doubt that a little patient search would produce plenty more such difficulties and obstructions; we have, in fact, a few others noted down for future remark, and it is evident that the whole forest department is in such a state of insubordination as to call for interference from the highest advisers of the Crown. That the Commissioner will be supported by them we cannot for a moment doubt. In the meanwhile it is satisfactory to know that we have at last an officer in command who is resolved to exact obedience from even the most refractory, as is in some measure shown by the striking fact that the deputy surveyors are no longer allowed to return 6*d.* an acre into the public purse, but have been, in 1852-53, compelled to produce among them the net sum of 36,239*l.*, notwithstanding the inability of the gentleman in charge of the New Forest to furnish his quota by the amount of nearly 1600*l.* But to the management of this important property we must devote a separate article.

WE have received a printed circular from Mr. JNO. ANDERSON, an officer of Inland Revenue at Fermoy, in which he gives the results of his experience in raising Potatoes from the seed (properly so called), or, as he terms it, the "seed of the Apple produced on the top of the stalk." The paper is much too long for insertion; but since Mr. ANDERSON does not pretend that *his* seedlings are exempt from disease, although much improved, and as he appears to have a good deal of experience, we select a part of his statement for the consideration of our readers. The most novel point adverted to in the paper in question is, that every successive generation of Potatoes raised from seed is found to be fitted for the climate and circumstances in which it has been produced, becoming more and more naturalised to withstand every change and vicissitude peculiar to the situation in which it becomes thus naturalised. That all have a certain duration of life, according to their time of arriving at maturity, which is generally between four and eight years, the early and most vigorous first, and so on in regular order of their maturation; and that while any variety is arriving at and remains in full perfection, it may be cultivated from the tubers, and that particular kind preserved with advantage, and no longer. That period he finds to be much shorter in some varieties than many are led to believe, and hence the great mistake in propagating from tubers of varieties in their decline.

Is this true? Is the statement susceptible of direct proof? Has any one determined the point *experimentally?* Is Mr. ANDERSON's assertion hypothesis, or is it theory? It will be observed that the whole question of extinction of races, about which so much has been written, is involved in the inquiry. If varieties of the Potato can be shown to have no power of retaining their vigour beyond seven or eight years, after which they sink into decrepitude, and finally die out, then we shall be justified in recognising the existence of a similar law in the case of fruit trees and other ligneous plants; and Mr. ANDREW KNIGHT's theory will stand on a solid foundation.

Mr. ANDERSON rests his opinion upon his own long experience, and upon a report by the Board of Guardians of Fermoy. But the report to which he refers merely states that the committee of the board was peculiarly struck with the care and perseverance with which Mr. ANDERSON had carried his experiments to what they think great perfection in many varieties, and great promise in others not yet matured. They saw many valuable old varieties (supposed to be extinct) renewed, and a great number of new kinds, which appeared sound and healthy, and of considerable value.

This report, then, although speaking highly of the varieties which had been raised at Fermoy, does not touch the main question, namely, whether the varieties of Potato have any fixed period of existence; it merely says that valuable varieties have been raised from seed, which nobody doubts.

For ourselves, we confess our inability to reconcile Mr. ANDERSON's statement with English experience. Thirty years ago, at least, the common market Potatoes were Ash-leaved Kidneys, Champions, Oxnobles. In what respect are these worse now than they then were? It is useless to appeal to disease as a proof of their wearing out; because in some districts Potatoes have never been diseased at all; and yet the age of a variety is the same in one district as in another. It is probable that some of our old experienced correspondents can throw light upon this curious question, to which we venture to invite their attention. What, for instance, is the ascertained age of the varieties of Potato now commonly grown; of the Shaws, for example, or the York Regent, or the Fluke?

It will be observed that these remarks are not offered in disparagement of Mr. ANDERSON's varieties, of which the Fermoy guardians speak so well. Their quality can be verified by anybody, since he sells the seeds as well as the tubers. The only point to which we desire to draw attention is the assertion, founded upon long experience, that the duration of life in the varieties of Potato lies between four and eight years. Had this been given as a speculation, we should have thrown it upon the heap of Potato rubbish which the last eight years have engendered. But being asserted as a fact, by a respectable witness, it deserves to be seriously examined.

VEGETABLE PATHOLOGY.—No. IV.

3. *Uses of the Science.*—There is, however, beyond doubt, much immediate benefit to be derived from the subject of vegetable pathology. Prevention is at all times more important than the cure of maladies already established, and the person who from mere ignorance would throw doubt on the labour of the vegetable pathologist is the very person who is loudest in his outcries against the theory of horticulture. The two sciences, in fact, go hand in hand, or rather the one is merely an extension of the other. The very principles which form the base of the one are the foundation of the other; and if the aphorisms which appear in our most approved treatise on the true theory of horticulture were verbally reproduced here, excepting as regards such points only as have been illustrated by new observations or experience since its appearance, they would supply a very considerable portion of what is demanded by a series of memoirs like that which we have undertaken. To keep a plant in perfect health, it is not only necessary to know what its healthy condition is, and on what such condition depends, but also to be able to estimate properly what may prevent or cause disease. And the case is not to be judged by the failures of mere theorists, or by the success which often attends just sense when accompanied by tact, which is in fact but an expression for an intuitive perception of what just theory would suggest, but by a comparison of the results which are obtained where information and practical skill go hand in one. The mere theorist assents at once to the enunciation of some undoubted verity, but applies it ignorantly, and where particular circumstances render it unsuitable; and consequently not only fails of the object in view, but induces diseases by improper treatment. Under such direction, go where you will over an establishment, and, in spite of the most restless activity and earnestness, there is failure everywhere; the Grapes are shanked or mildewed, the Melon-pits unfruitful or full of corruption, the Asparagus wiry, the fruit trees mossy and unproductive, and nothing ready at the time when it is most wanted and expected. And in such cases every remedy which is applied to prevent evil is sure to aggravate it, because it is improperly employed; mere chance, indeed, or empiricism, will often lead to better results, because there is a possibility of their being right, exactly as the mere novice at billiards will make more chance hazards than one who has some particular end in his play, without the necessary skill or science. It is sound knowledge which can alone enable the cultivator to grapple effectually with the difficulties which wait upon him at every turn—which can appreciate important facts when they come before him, and turn them to account. It is sound knowledge, too, which alone possesses the patience which is necessary to the complete investigation of phenomena, in order to their effective control. An apposite instance is afforded by the history of the Grape mildew, which is only second in importance to that fatal murrain which has produced effects on society which could never have been imagined when it first made its appearance. From local circumstances great facilities existed at the spot where the Grape mildew was first observed, for the proper direction of talent in whatever condition of life it might exist. It so happened that a clergyman deeply imbued with the love of natural history and science, though with no pretensions as an author, perceived the good that might be effected in the place by bringing under the control of religion the talent which he perceived existed in no ordinary degree amongst his parishioners. He was seconded in his views by persons of weight and influence either from their position or abilities, and in consequence a most flourishing literary and scientific institution was established, with the greatest desire on every side to promote inquiry even in persons of the humblest station. One of the fruits of the impression thus made was the production of a statistical account of the place, comprising more especially a review of its sanitary condition, which has obtained a circulation far beyond any local interest, though from the pen of a mere dispenser of the produce of what the Euphuist called "the milky mothers of the herd." It was in this particular locality the Grape mildew first appeared, and as soon as its calamitous nature was ascertained, a gardener in a comparatively small establishment was ready

to apply his native talents improved by the local culture just mentioned to the important subject. He began by a microscopical examination, in which he found very ready and competent assistance, and he did not desist from the study till he had discovered an effectual remedy, and in consequence his name, though that of a humble labourer, is now in every one's mouth wherever the scourge has passed. And there is not a doubt that much is to be effected by the talented and industrious cultivator in the same way, and that even where there is no encouragement on the part of the employer, but where every deviation from the accustomed routine is regarded with suspicion, as the writer of these remarks can bear witness. The subject was illustrated before by that extraordinary and destructive malady which has marched through the breadth and length of the world, carrying desolation everywhere. It will not, however, be out of place to say a few words in reference to the experience of that disease in the particular spot of which we have been speaking, because it has a close bearing on the end which is contemplated by these prefatory remarks. Its ravages in the years 1832 and 1833 were very severe, and, as in other places, the attempts at cure were at first vague and unsatisfactory. It was determined, however, by one of the resident practitioners to study the matter deeply, and more especially the phenomena exhibited by blood under the influence of oxygen and carbonic acid. Some important additions to the knowledge of the physiology of circulation were made in consequence, and recorded at the time, which were much appreciated in France and Germany,* though but little noticed at home. One singular circumstance was elicited, namely, that blood once blackened by the presence of carbonic acid, resumed for a single time, when highly impregnated by saline matter, a most vivid arterial tint on the passage of a stream of oxygen through it, but when this scarlet hue was dispersed by a new stream of carbonic acid it was utterly incapable of again becoming arterial. This curious circumstance led to a consideration of the proper limits within which transfusion of saline matters into the circulation of persons labouring under cholera should take place, and this combined with other remedial measures was attended by the most happy results, and was confirmed on the reappearance of cholera in 1848, and in many insulated cases between the two principal periods of visitation. The application to the subject before us is easy enough, and without further preface or apology we shall pass on to the exposition of such principles as it is necessary to lay down before treating of different forms of disease. *M. J. B.*

PELARGONIUM TRICOLOR.

The well contrasted and vivid colours of the blossoms of this plant, together with their lasting a long time in perfection, render it extremely useful for all decorative purposes. Indeed, when seen in the form of a well grown specimen, and thickly covered with numerous trusses of charming flowers, few plants with which I am acquainted are more attractive or striking.

In commencing its cultivation be sure you select a vigorous healthy plant, carefully avoiding such as are at all leggy or sickly. Place it in growing circumstances early in March, for it is not a plant of rapid growth, and unless it has a long growing season a large specimen will not soon be obtained. Before starting it examine the state of the roots, clearing away all sodden or unkind soil, and thoroughly repair the drainage, repotting in the same sized pot, or giving a small shift according to circumstances. The best situation for it at first is a light airy place near the glass, where the night temperature may average about 55°, allowing it to rise some 10° during the day with sunshine and air; keep the atmosphere moderately moist and sprinkle the plants overhead with the syringe on the mornings and afternoons of fine days, but apply water to the soil with caution until free growth has been induced. If a bushy specimen has been secured at first little trouble will be required to maintain a compact habit of growth, but if the plant is at all leggy, it will be necessary to pinch out the points of the shoots. After pinching, the plant should be allowed to break and get into free growth before shifting, otherwise defer that operation until the roots have taken to the fresh soil, for the plant is somewhat apt to die off suddenly, and there may be considerable risk in cutting back the shoots and repotting at the same time. As the shoots advance in growth keep them tied or pegged out in a regular manner, removing all trusses of flowers as they appear, and pinching out the points of the shoots as may be necessary to secure well formed specimens. It will, however, be found that the habit of the plant when in good health, and not kept in too warm a place, is such that very little stopping will be required to keep the specimens bushy.

When the weather becomes warm in spring, so as to allow of freely exposing the plant to light and air, the night temperature may be increased to about 60°, but it should not exceed this at any season; and when the weather will admit a slight circulation of air should be allowed during night. The plants should occupy a position in a cold pit or frame in summer, and be slightly shaded from the direct rays of the sun on very bright warm days, permitting a free circulation of air, and maintaining as moist an atmosphere as can conveniently be done. Have an eye to the state of the roots, and as soon as it may be necessary to afford these space shift into a pot about two sizes larger if early in summer; but if after the middle of June be contented with a smaller shift. Be particular to have the ball and soil in a moist but not wet state when the shifting is performed, and apply water with great caution until the roots get hold of the fresh soil, for this plant is very easily injured by excess of moisture at the root. During fine warm weather the lights may be left off at night, for the plants will be greatly benefited by exposure to the night dews. Discontinue shading and syringing over-head as soon as the heat of summer is over, and after this aim at securing slow growth and getting the wood properly ripened before winter, giving a freer circulation of air, and keeping the atmosphere cooler. When cold damp weather occurs, remove the plants to their winter quarters, which should be a light situation near the glass, in the warm end of the greenhouse, where they will be out of the way of cold draughts, which are apt to turn the foliage foxy. While in a state of rest, water must be very cautiously applied to the soil, giving a good soaking when it is wanted, and carefully avoiding frequent surface waterings. It will be necessary to grow the plants a second season, if large specimens are desired, in the shortest possible time, and in this case they may be treated the second season as they were last, taking care to stop or cut back the shoots sufficiently in spring, to ensure compact close growth. Specimens intended for blooming should be allowed to remain in the greenhouse until they come into flower, when they may be removed to the conservatory, or any cool situation, where they will bloom profusely from the middle of April to the end of June, or longer, if they are slightly shaded. After their beauty is over, remove them to a close part of the greenhouse, or to a cold pit or frame, cutting back any shoot, as may be necessary to ensure compact growth, and give a moderate shift if the pots are full of healthy roots. Syringe over-head on the mornings and afternoons of fine days, to encourage free growth.

Cuttings of the half ripe shoots root with care and attention, but not so freely as those of many plants. Insert them in sandy peat soil, covering them with a bell glass, and place them for a month in a shady situation in the same temperature in which they have been growing, guarding them carefully from damp, then plunge in a gentle bottom-heat of about 70°, where they will soon emit roots. Good turfy peat, and sandy turfy loam in the proportion of two of the former to one of the latter, liberally intermixed with sharp silver sand and clean small potsherds, will ensure the free percolation of water through the mass, after the decay of the fibre. Use plenty of potsherds in the bottom of the pot, so as to ensure perfect drainage. *Alpha.*

Plough v. *Spade.*—In your Leading Article of the 21st you seem to think Mr. Gisborne unjust towards the Lois Weedon system of cultivation, inasmuch as he treats it as a revival of Jethro Tull's plan, without taking into account Mr. Smith's improvements, one of which is the use of the fork or spade instead of the plough. But would Mr. Gisborne have considered this an improvement? In the very page from which you make extracts he seems to speak disrespectfully of the spade. Even in what is considered garden work, such as the cultivation of Potatoes, he calls the plough the more efficient implement. This preference of the plough to the spade, on the part of a practical as well as clever man, seems to deserve consideration, particularly at a time when the good old toast of "Speed the plough" is giving way to the cry of "Supersede the plough." You may perhaps remember that Mr. Pusey expresses something like a similar preference, in speaking of the cultivation of Wheat, in the Agricultural Journal, vol xii. p. 590. *Sinope, Jan.* 24.

Henry Dixon, Dorwards Hall, Witham, Jan 9.

Effect of Tight Ligatures.—Four years ago I planted some Peach and Nectarine trees some feet in advance of a south wall, with a view to erect glass over them at my convenience, which is now done. For the last two years they have been under hotbed frames. In the spring of 1852 I found that one of the Peaches was too erect, I therefore tied two single pieces of tar band round the main stem, within a few inches of the point where the branches begin to spread, fastening them down tightly to a stake in the ground, and thus brought the tree to a proper slope. On pruning it a day or two ago, I observed that the band had become completely imbedded in the tree; the bark appears to have grown over both places where the string was tied, with the exception of what I may term the skin, and instead of this there at present appears a rim of gum round the tree in each place; its growth has been rapid, otherwise what I have stated could not have taken place, and it is looking in perfect health; a gardener of experience, however, is under the impression that the tree will eventually be materially injured, if not almost destroyed by this occurrence. I shall be greatly obliged if you will give me your opinion on the subject. *S. B., Jan.* 24. [The gardener is right.]

New British Plant.—A specimen of Ophioglossum lusitanicum has been sent me from Guernsey, having been found growing wild in a meadow in that island. *J. Smith, Royal Gardens, Kew, Jan.* 24.

Anatomy of Thalia.—Can you give me any information with respect to the structure of the leaf-stalk in Thalia, in which there seems to me to be something unusual. The leaf-stalk of this plant contains a number of long air canals disposed in a regular manner, and, one of which is much larger in diameter than the others, but all have at intervals horizontal septa made up of stellate cells between which there are large intercellular spaces. Passing vertically through the air canals, and quite distinct from the walls of these cavities, are a number of delicate fibres quite visible to the naked eye, and which appear to pass through the intercellular spaces, and have sometimes an attachment to the sides of the cells. These fibres under the microscope have, as far as I have seen, no very distinct structure. They may be seen as well in dried specimens of this genus as in fresh, but in Canna, Maranta, Hedychium, Strelitzia, and other similar plants which I have examined for the purpose, I can detect none of these thread-like bodies. If you could kindly tell me where I could find an account of this, to me, unusual structure, you would greatly oblige. *Maxwell T. Masters, Fielding Herbarium, Oxford.* [The structure is as you describe it, and very curious. We do not recollect any published account of it. The fibres are bundles of woody tissue, and are here and there distinctly tubercled.]

The Deodar.—The accounts which you have published of the durability of the wood of the Deodar are certainly conclusive as to its merits in India; I do not think that we ought, therefore, at all to expect that it will be valuable when grown in England. The wood of the Cedar of Lebanon grown in England is always said to be of small value, yet I believe the wood of the old trees on Mount Lebanon to be as durable as that of the Deodar in India. The pieces which I possess have every appearance of being so, and I do not remember seeing any signs of decay even in the most broken and shattered of the old trunks. I believe, also, that the wood which Mr. Layard brought from Nineveh is the wood of a Cedar, which would probably be the Cedar of Lebanon, or a variety much more closely allied to that than to the variety of the Himalaya mountains, which we call the Deodar. If this be so, as I believe it to be, it would not be wise to plant the Deodar extensively in England, under the supposition that it is to turn out a valuable timber tree here. *C. W. Strickland.* [We should much like to see a specimen of Cedar of Lebanon wood, from Mount Lebanon itself.]

Underground Drains for Plant Houses.—I beg to add my testimony to the advantages of underground drains for admitting air constantly to plants, especially in such weather as we have lately had, when other means of aëration must have been but limited. The plan adopted here is different from that at Drayton Manor; one large pipe is laid 3 feet deep, beginning at 90 feet from the front flues; it is carried to within 15 feet of the intended openings in the house, where three small pipes are cemented with their ends inside the larger one, one giving air in the middle of the house, the two others at equal distances on either side. It was inconvenient to bring the drain in front of the house, consequently it begins at the back, and is carried under the floor of the potting-shed and the house itself to the front flues. Besides the advantage of furnishing air at all times, the drains materially assist in keeping out frost; taking for instance, the morning of Jan. 3, when the thermometer was at 4°, I firmly believe that the plants would have been frozen, had it not been for the air admitted at the temperature of the earth three feet deep. I should prefer the plan employed at Drayton Manor, where the drains are in front and each drain entire throughout. The late Mr. Milne (once gardener at Drayton), told me that the drains exceeded his most sanguine expectations, as indeed the health of his plants abundantly testified. I should mention that the heating apparatus in the house above alluded to is very small—quite insufficient for such extreme cold as that on the night of Jan. 2. On stopping the drains on cold nights, the temperature of the house has been lower than on similar nights when the drains have been open, the external temperature in both cases being the same. *T. Dowell, Amington Hall.*

Winter Cucumbers.—Since Mr. James, gardener at Pontypool Park, has considered it worth while to state (see p. 38) that a 34 feet house with 18 plants in it has produced him 151 Cucumbers, from the 7th October to the 18th January, it may perhaps not be uninteresting to know that at Chatsworth 280 have been cut from the same number of plants between the 11th of November and the 24th of January, and they have had but little attendance. *Thomas Bland, Chatsworth.*

Water in Food.—The observation in your columns of the 14th inst., that "it is quite a mistake that to boil a pound of rice in a gallon of water creates a gallon, or whatever a gallon weighs, of food—there is just a pound of nutriment, and no more, though a hogshead of water were used," though strictly true, it is much to be feared may have a mischievous tendency; it may deter many from the adoption of economical cookery. The lower orders of

the people are little aware of the great proportion of water that is contained in the ordinary articles of their food, so that it may be useful to instance how much water is in bread, butchers' meat, and Potatoes. One lb. of flour made 1 lb. 6 oz. of bread,—these additional 6 oz. could be nothing but water; 1-lb. and 1 oz. of fresh beef weighed no more than 10 oz. when boiled—it therefore must have contained nearly 7 oz. of water, besides that which still remained in it after boiling; the same weight of salted beef lost but 5 oz. in boiling, though in the Royal Navy the loss of weight allowed is exactly half of that put into the copper. Potatoes contain about four-fifths of their weight of water. But it is not merely the water contained in cooked aliments themselves that can suffice for wholesome digestion of them; hence the agricultural labourer drinks a considerable quantity of water, either the pure element or in the shape of weak tea, weak beer, or weak cider, especially if his diet be the so frequent one of bread and a shaving of cheese to give it relish. True the quantity of water remaining in aliments may be too great for the due support of man, as is practically seen in those poor-houses where water-gruel enters largely into the dietary of paupers; and no one would consider rice water to afford sufficient nourishment, though rice made to absorb as much water as it will do without breaking down the grain, forms the chief nutriment of thousands in the east. But there is another consideration which influences cookery, especially that called economical; it is that of late years scientific investigations have demonstrated that many different properties are essential in the food of man; there must be the materials requisite for the formation of flesh, of fat, of bones, &c. Now economical cookery provides these requisites for the poor man, as a luxurious kitchen does it for the rich. It is noticed above that boiled fresh beef contains nearly 7 oz. of water; this implied that water was not the only element given out by the beef; that other element was the basis of a nourishing soup, and in economical cookery the whole is made available, whether the produce be a soup or a stew. It would seem that at the present relative prices of butchers' meat, grain, and sugar, the latter should enter more largely than is customary into the composition of cheap food. Sugar seems to be particularly fattening; it was 60 years ago remarked that negroes on a sugar plantation always became plump, healthy, and fat at times of harvesting the crop, when they luxuriated in sucking the sugar-cane; also that ruffs and rees when put up to fatten had usually a large quantity of sugar mixed with their food; but experiments made in consequence were amongst the first proofs that different properties are requisite in the substances destined for alimentation; some ruffs and rees were fed exclusively on sugar; these birds were all of them literally starved to death. From this it may be concluded that although sugar might advantageously be used in cheap cookery, still it should not be to the exclusion of other constituents of flesh, fat, and bone. Indeed it would be found on investigation that a variety of constituents does actually enter into the food which at first sight seems to be the simplest; and a due mixture of these constituents should be a chief aim in all receipts for cookery for the humbler classes. This in a great degree really has been effected in Scotch, as it is in French cookery; and it may be hoped that science will combine with benevolence to point out means by which the English cottager may be as well fed as his continental neighbours, and at as little cost. *B.*

Orchard House.—"W. C. E.'s" definition of an "orchard house" (see p. 23), viz., "a house for the cultivation of miniature fruit trees in pots," is, I think, an incorrect one. It is certainly a house for the cultivation of fruit trees, but it is surely not imperative that they should either be miniature trees or in pots; if so, I for one would join him in condemning orchard houses. *J. Stevenson, Lambton Castle.*

Foreign Correspondence.

LEAVES FROM MY CHINESE NOTE BOOK, No. IV.—*Spring Flowers in the North of China.*—In the north of China there are a number of plants which have their flower-buds very prominently developed in autumn, so much so that they are ready to burst into bloom before the winter has quite passed by, or, at all events, on the first dawn of spring. Amongst these Jasminum nudiflorum occupies a prominent position. Its yellow blossoms, which it produces in great abundance, may be seen not unfrequently peeping out from amongst the snow, and reminds the stranger in these remote regions of the beautiful Primroses and Cowslips which grow on the shaded banks of his own land. Nearly as early as this, the pretty daisy-like Spiræa prunifolia, the yellow Forsythia viridissima, the lilac Daphne Fortunei, and the pink Judas tree, become covered with blossoms, and make our northern Chinese gardens extremely gay. There are also some good Camellias which flower at this time, but they are generally grown in pots under such shelter as mat sheds and other buildings of a like kind can afford. The double blossomed Peach, of which there are three very distinct varieties now in England, are perhaps the gayest of all things which flower in early spring. Fancy, if you can, trees fully as large as our Almond, literally loaded with rich coloured blossoms, nearly as large and double as Roses, and you will have some idea of the effect produced by these fine trees in this part of the world. On the south-west side of Shanghae there are numerous Peach gardens studded over the country. These are well worth a visit in the month of April, as the trees are then in full bloom, and have a charming effect upon the landscape. It is in this part of the country where the celebrated Shanghae Peach is largely cultivated. On the graves, which are here scattered over all the fields and appear like huge mounds of earth, I observed many pretty Violets in flower, both white and purple, but all nearly scentless. A little later in the season, that is from the 20th April to the beginning of May, another race of flowering shrubs and herbaceous plants succeed those I have already named. The most conspicuous amongst them are Viburnum macrocephalum and dilatatum, with their large heads of snow-white flowers; Spiræa Reevesiana, and the double variety, which is more beautiful than the original species; Weigela rosea, now well known in Europe; Moutans of various hues of colour; Azaleas, particularly the lovely little "Amœna;" Kerria japonica, the lilac and white Glycines, Roses, Dielytra spectabilis, and Primula cortusoides. It will easily be believed that with such a host of Flora's beauties these Chinese gardens must be gay indeed. But perhaps the most beautiful sight of all is the Glycine sinensis, climbing upon and hanging down from other trees. I believe I noticed in my former "Notes" the fine effects produced by this climber when in such situations. I have again observed numerous examples this spring and cannot help drawing attention once more to the subject. The fine plant of this species upon the Chiswick garden wall is much and justly admired, but if you will imagine a plant equally large, or in some instances much larger, attaching itself to a tree, or even a group of trees, entwining itself round the stems, running up every branch, and weighing down every branchlet; and, in the end of April, or beginning of May, covered with flowers, some faint idea may be formed of the fine effects produced by the Glycine in its native country. I believe it would not succeed if managed in this way near London, or anywhere in the north, but the experiment would be worth a trial in some parts of Europe, where the summers are warmer than they are in England. As I know you have many readers in the United States of America who are as fond of their parks and gardens as we are of ours, I cannot do better than recommend the experiment to them. Many of our northern Chinese plants succeed admirably in America.* China and America are both situated on the eastern side of large continents, they are equally liable to extremes of heat and cold, and consequently the shrubs and trees of one country are almost certain to succeed as well in the other, provided they are reared in the same latitudes, and grown in the same kind of soil. *R. F.*

Societies.

LINNEAN, *Jan.* 17.—R. BROWN, Esq., V. P., in the chair. J. Disney, Esq., F. W. Headland, Esq., G. H. K. Thwaites, Esq., and Rev. J. G. Wood, were elected Fellows. Mr. S. Stevens exhibited a series of dried specimens, accompanied by notes on their properties and uses, of barks, woods, &c., of economic and medicinal plants, collected at Santarem, on the river Amazon, by Mr. H. W. Bates. Among these was the *Cupá-úba*, the Copaifera; the heart of this tree yields the balsam, as much as five gallons sometimes flowing from a single tree; sometimes a tree overcharged will burst spontaneously with a loud report, and the same also occurs with the India Rubber tree. Another was the Urtiga branca, an arborescent Nettle, a decoction of the root of which is an effective remedy in bloody flux; but the specimens were for the most part noticed only under their native names. The following papers were read:—1. Note on the Introduction of Anacharis alsinastrum, Bab., into Ireland, being an extract from a letter addressed to T. Yates, Esq., by Mr. D. Moore, of Glasnevin. The plant appears to have been first noticed about 1842, in the garden of M. D'Olier, Esq., of Booterstown, near Dublin, and to be at present confined to a few gardens in the neighbourhood of the Irish capital. 2. Extracts from a Letter addressed to Dr. Berthold Seeman, by Dr. Vogel, dated Murzuk, on the Botany of the region between that place and Tripoli. In the great valleys at about 30° N. lat., through which Dr. Vogel passed, the whole vegetation, with the exception of a Ruta, was dried up; withered Grasses, Wormwoods, and Thyme, being met with in abundance. Southwards the country became still more naked until, about Fezzan, nearly every vestige of wild plants had disappeared, save a shrubby Tamarix, and a spinose Papilionacea, called Agûl by the Arabs, and used as fodder for the camels. In the gardens about Murzuk, several kinds of grain and culinary plants are cultivated by sowing the seeds in a layer of a couple of inches thick of decomposed manure, with which the hard saline soil is covered. During winter, Barley and Wheat are grown; in summer, Gosub and Gafuli, the two latter furnishing the chief food of the inhabitants of the Sahara. Specimens of these have been sent by Dr. Vogel for the determination of their botanical names. The Gafuli mosri, so often mentioned by African travellers, is the Indian Corn. In this part of the world, so little return is obtained from the agricultural crops, that the inhabitants surround each spike of the Gosub and Gafuli, with a neatly-made basket, to prevent the attacks of wild pigeons. The finest among the trees is a Cornus, called Kurno by the Arabs, which attains 80 feet in height, and a diameter of 3 feet. The Gum Acacia adorns the stony sides of the valleys of the Wadi Schergi and Cherbi. The principal bulk of the gum is brought by the Tuariks, and seems to grow between Dgerma and Ghat. The Senna of commerce was collected near Dgerma, west of Murzuk, under Date Palms, and is found in enormous masses in Ahir, but the leaves are now gathered in very small quantities, on account of their trifling commercial value. Peganum Harmala, called Harmal, is a prominent plant, and celebrated as a preventive against ophthalmia. Every Arab swallows in the spring about a dozen of the immature seed-vessels, with the belief that this will exempt him from all diseases of the eye. The Colocynth is also common; its fruit is used against urinal and venereal complaints; Ricinus communis is very common about Tripoli, and the oil might become an article of export. The Date Palm is much cultivated about Fezzan, all Fezzen, and half of Tripolitania living upon it; every door and post is made of its wood, and the fruits are the food of man and beast. Some idea of the enormous number of Date Palms growing here may be formed from the fact that in 1829 when Abdel Gelil besieged Sokua, he cut down during seven days, 43,000 trees, yet there are still 70,000 to be found; 100 full grown trees yield about 40 cwt. of Dates. When the heart of the leaves has been cut out, a sweet thickish fluid collects in the cavity called Lagbi, which is very refreshing and slightly purgative; in a few days this fluid ferments and becomes acid and intoxicating. In Tripoli there are cultivated the following fruits:—Oranges, Lemons, Pistacias, Pomegranates, Figs, St. John's Bread, Mulberries, Peaches, Apricots, Almonds, Olives, Opuntias, and Grapes in abundance; Apples and Pears are plentiful, but of poor flavour; Melons and Water-Melons arrive at great perfection, the latter weighing 150 lbs. Potatoes succeed in Tripoli, and are large and fine flavoured. Of the above fruits the following extend as far south as Murzuk (lat. 25° 55′); namely, Pomegranates, Figs, Peaches, Almonds, and Grapes. The Vine succeeds well on the shores of the Natron Lakes of Fezzan, its branches climbing over Pomegranates and Fig trees.* Oranges, Lemons, Pistacias, and St. John's Bread do not go further than the Targona mountains. The Olive tree is not found beyond Benoulin, on the southern slope of the Targona. The Mulberry extends as far south as Sokua (29° 4′); the Apricot as far as Sebba (27° 3′). The Vine is said to grow wild in Tripolitania, but that statement Dr. Vogel considered incorrect, as he had never seen it, except in a cultivated condition. 3. Observations on the genus Oxycladus, by John Miers, Esq. The object of the author was to answer the objections raised on a former occasion by Dr. Seeman, against placing this genus in Bignoniaceæ, and to point out the features which he considered to establish its affinity with that order, rather than with the Myoporaceæ, to which group Dr. Seeman refers it. In Oxycladus it was stated that the branches and rudimentary leaves are distinctly opposite; the flowers present a fifth sterile stamen; the anther cells are distinct and widely divaricated upon a large fleshy connection; the ovary is seated on a five-lobed fleshy disk, and is completely two-celled, with about six ovules in each cell, suspended and attached by a ventral thread to a distinct flat dissepiment, and arranged in three superimposed pairs on its opposite faces; the ovules all but one become abortive, so that the fruit is one-celled and monospermous. In all these characters the plant does not agree with Myoporaceæ. The want of wings to the seeds occurs, moreover, in other Bignoniaceous plants besides Oxycladus, as in the genus Spathodea. In Oxycladus, too, the seeds are exalbuminous, in which they also differ from Myoporaceæ. "After the comparison of these several features," Mr. Miers concludes, "I confess I cannot perceive the existence of any marked affinity between Oxycladus and any genus of Myoporaceæ, and therefore see no reason to alter the conclusion at which I formerly arrived, that this genus, although deviating from the usual form of its fruit and seed, bears in every essential respect all the characteristic features of a member of the Bignoniaceous family."

* See an account of Spiræa prunifolia pleno, and Forsythia viridissima, by Mr. Saul.

Notices of Books.

A Guide to Geology, by John Phillips, F.R.S. Fourth Edition, 12mo, pp. 211 (Longmans).—This is perhaps the best work we have on the elementary principles and fundamental facts of geology. Coming from the successor of Dr. Buckland at Oxford it would carry with it authority, even had the author's reputation been less than it is. But it is no disparagement to other geologists to say that Mr. Phillips stands in the foremost rank of British science—*Princeps inter principes*; and we feel grateful to such a man for occupying himself as he does in this instance with an exposition of the alphabet of his science. We congratulate our Oxford friends upon the possession of a text book so eminently suited to sustain the reputation of the school which Buckland founded. The illustrations, although without pretension, are capital diagrams for the purpose of teaching. What Mr. Phillips says upon the progress of geological science will show the reader what he may expect from the little book itself.

"It is obvious that for the right and full understanding of the phenomena which come before a geologist, he must often refer to the established results of other branches of physical science. Mineralogy must be his guide in ascertaining the ingredients of rocks; chemistry must teach him their ultimate constitution; he must apply to botany and zoology for the examination of extinct plants and animals; and to astronomy and general physics for correct general data within which to confine his inferences. How clearly does this show us the reason why the universally occurring facts concerning the structure of the globe have only within a few years been submitted to any regular investigation, or reduced to general truths! Generalisation in geology can only be based upon the established results of other more limited natural sciences. Every discovery of laws in chemistry and zoology widens the foundation of rational geology; and so long as men adhere to the method of philosophy taught by Bacon, geology can never again be lost in vain speculations, never again be an arena for discussing delusive hypotheses and unsubstantial conjecture.

"Geology, whether regarded as a history of the early physical revolutions of the earth, or as the science by which this history has been in some degree recovered, has really no other foundation than exact observation and careful induction. It would, therefore, be not a harsh sentence to refuse this title to the mass of mere opinions and conjectures which for some hundred years before the nineteenth century were pompously designated Theories of the Earth. With much better right may the title of geologists be conceded to Strabo and

* A combination, it was observed, which occurs on the Nineveh sculptures.

the old philosophers who studied the local phenomena of their countries and proposed limited hypotheses, in agreement with their notion of the laws of nature, than to Burnet and Buffon, whose systems of cosmogony have the air of a philosophical romance rather than of a serious generalisation of facts. The history of the progress of opinions in geology may be useful as a warning to men advanced in geological inquiries, not to reason upon assumptions while facts remain to be explored, and to repress that impatience of spirit which ever seeks to anticipate observation by the efforts of invention; but the student should, if possible, be kept in impartial ignorance of these conflicting hypotheses, which are too apt to fascinate the young and imaginative mind. For this reason we shall pass silently over the whole subject of the history of theoretical or rather hypothetical geology, and shall proceed to record those positive facts and limited inferences which are the real discoveries in the science."

Sunlight through the Mist (Murray) is a book for young people to amuse themselves with on Sundays. The authoress states that her object is to interest children, and at the same time to teach them lessons of piety and wisdom by showing them the result of religious principle on the lives of others. To us it appears that the attempt is likely to be perfectly successful.

The Symmetry of Vegetation by Prof. Lindley (Chapman and Hall) is a sketch of the principles to be borne in mind in representing plants, whether pictorially or conventionally. It is the substance of three lectures given in 1852 to the students of practical art at Marlborough House.

New Plants.

40. Pinus Royleana. *Jamieson.*

Although the seeds, cones, and a few loose leaves of this plant are all that have as yet reached Europe, there is no doubt that it forms a species previously quite unknown. The leaves are like those of the Scotch Fir in almost all particulars, except that they are much more slender and short; and the cones, of the size of Pinus sylvestris, have an entirely different form, are smooth as if they had been half polished, and their scales are flat-headed, with a fine, hard, sharp mucro, very distinctly hooked back. All that is known of its history is that the fragments above alluded to were received at the India House in 1853, from Dr. Jamieson, as belonging to a noble tree, growing in Nepal at an altitude of 8—10,000 feet, and therefore perfectly hardy. From the seeds a very few plants have been raised in the Garden, where they prove to be, in their seedling state, quite different from any species previously raised there. It certainly is new to our collections. Previously we had no Pine from India with only two leaves in a sheath, and very small cones. *Journal of Hort. Society; Vol. IX., with a figure of the cone.*

41. Pitcairnia nubigena, *Planchon and Linden.*

A very fine species with broad strongly ribbed perfectly green leaves, and beautiful thyrses of deep rose-coloured flowers. It inhabits the cloud-compelling summits of the Columbian Alps at the height of 8000 or 9000 feet above the sea on the *Paramo de los Conejos*, whose crests, occasionally covered with snow, overhang the boundless virgin forests that extend down to the lake of Maracaybo. There it was discovered by Mr. Linden's collectors, Funck and Schlim, in 1847. *Flore des Serres*, 847.

Garden Memoranda.

Mrs. Lawrence's, Ealing Park.—It may be interesting to know even thus early in the season that the magnificent collection of plants for which this establishment is so justly celebrated is at the present time in most excellent condition, and that the Metropolitan exhibition tents may be expected to be furnished with even, if possible, finer examples of skilful cultivation from this establishment this year than they were last. In a small stove were Rondeletia speciosa, Cyrtoceras reflexum, Francisceas, and Ixoras, plunged in tan to start them into growth. The tan has hitherto been placed immediately on the top of a heated chamber, but in future Mr. May intends introducing about 6 inches in depth of coal-ashes below the tan, with a view to keep it moist, as wherever it comes in contact with the warm surface of the chamber it is found to get much too dry to be of service to the plants. A greenhouse adjoining this stove has just been painted and reglazed with long panes, which admit considerably more light than the old roof did, and the plants being now placed under more favourable circumstances have become in consequence greatly improved in condition. Among others we remarked five most excellent specimens of Boronia serrulata, measuring nearly 3 feet through and as much high, with not a brown point or leaf on them. Some idea of the rate at which these plants have grown will be conceived from the fact that three years ago they were only in 6-inch pots. The soil used for them is a mixture of peat and sand. Some Pimeleas which were in 3-inch pots this time last year are now about 18 inches in height, proportionally wide, and covered with flower buds.

In an intermediate stove were huge specimens of Allamandas, Stephanotis, Hoyas, &c., just being trained into shape, strong wire trellises being used for the purpose, which are found to be more lasting and otherwise better than wood. A stove at the end of this house contained some admirable specimens of Ixoras, but more especially of I. javanica. These are plunged in tan with their tops in a nice growing temperature, and have already pushed abundance of young shoots all over them. Some idea may be formed of their size when we state that they are in 22-inch pots. Associated with them was a plant of Messrs. Veitch's Hexacentris mysorensis, in an 18-inch pot, and covering a trellis nearly 3 feet high, and as much through. This was in a 3-inch pot last July. There were also in this stove various Dipladenias, which promised in a short time to be very fine specimens.

Passing through the Heath house, in which were some remarkable plants, we come to the specimen house, in which were immense bushes of Boronias, Polygalas, Eriostemons, Coleonemas, Gompholobiums, Pultenæas, Pimeleas, and other plants of that kind. As regards Pimeleas, we may mention that the enormous plant of P. spectabilis, which was covered with such multitudes of blossoms, and which was the admiration of every body who visited the garden exhibitions of the Horticultural Society last year, will not appear in public this season. It had got from age so naked in the centre, that it was found necessary to prune it well back, and although it is pushing vigorously, it will not be fit to show this year. Its loss for a season, however, need not be regretted, for there are already magnificent specimens of the same kind of plant standing side by side with it, and ready to take its place.

What is called the "New Holland house" also contains many noble specimens of greenhouse plants, such as one rarely has the good fortune to see. This house has been altered since we were last at Ealing Park. Instead of the stage being in the middle and a path all round it, a broad passage now runs up the centre of the house, and a stage on either hand falls quite back to the glass, giving the opportunity of placing the smallest plants in front and the largest ones next the passage, which causes their tops to slope to both sides at an angle nearly corresponding with that of the roof. In this house were huge examples of Epacrises, Heaths, Pimeleas, Chorozemas, Everlastings, Eriostemons, &c., and all in the most luxuriant condition.

In the stove a compartment at the entrance prepared for flowering Orchids in summer is at present filled with Cacti. In another compartment is the famous Amherstia nobilis, which this establishment contains. It would have been very fine this season; but on smoking it with tobacco a short time ago to kill aphides it dropped all its flower spikes, and almost every leaf which it possessed. It is, however, again covered with foliage, and several fresh flower-spikes which it has made are already beginning to expand their blooms, the colours of which, notwithstanding the dulness of the weather, are extremely brilliant. Two plants of Heliconia braziliensis are also very gay here at present. Among Orchids there was, as a matter of course, little in flower, but the plants which are wintered on the dry and cool system look exceedingly healthy and clean. In order to diminish the amount of fire-heat required to keep out the intense cold we have lately experienced, we observed that coverings of frigi-domo had been placed on rollers, so as to be let down over the roofs of some of the houses at night. This is everywhere found to be a much better protecting material than mats.

In the open ground several of the large timber trees are being felled where they are too thick, or where they would ever be likely to shade valuable plants. We also understand that other alterations as regards the improvement of the lawn are in contemplation.

FLORICULTURE.

Forcing Azaleas.—The ordinary mode of treating Azaleas is well known to most people, but there are many who do not seem to be aware that they can be managed so as to be had in flower at least nine months out of the 12; and this merely by means of paying a little attention to well ripening the wood, allowing them a season of rest, and being particular as to time of introducing them into heat, &c. By attending to these matters they will not only continue to keep the conservatory gay during the winter and spring months; but they will also furnish cut flowers for glasses and bouquets. They may be propagated freely by means of cuttings, or by grafting; but I would recommend those beginning to grow them to leave their propagation to the trade, as they can now be had from any nursery at a very moderate price. The plants should be examined as soon as you get them; and if a shift is necessary, which will be known by turning them out of their pots and inspecting the roots, move them into pots a size larger than those they are in; previously clean them, however, and well drain them. Should the roots be at all matted, which is sometimes found to be the case, the space between the ball and the new pots should be filled rather firmly with the fresh compost, as, if this is not attended to, the water will probably run off the balls into the loose soil, and may cause the death of the plant. The soil I would recommend for growing the Azalea is simply sandy peat; I have found them to succeed better in this alone than in any other compost. After shifting, place the plants in a pit or house, as near the glass as possible, and where the temperature will range between 55° and 60° at night, allowing it to rise a few degrees in the day-time. Great attention must be paid to giving water, of which the plants will take a great deal, provided the drainage is good. As the plants advance in growth weak manure-water may be given twice a week, which will assist materially in keeping them robust and healthy, sprinkling them over-head with tepid water, and shutting up early in the afternoon. Air should be given on all favourable opportunities; this will not only tend to keep down red spider, but also thrips. This latter pest is considered by some difficult to eradicate I have, however, found tobacco-smoke at all times effectual in removing it. Fumigate in a mild evening, keep the house close the following day, and should there be bright sunshine, shade rather than give air; should this not prove effectual, fumigate again the following evening, and in the morning you will have the satisfaction of finding every insect destroyed. It will be necessary to tie out the shoots of such plants as have a rambling tendency, in order to secure a compact and bushy habit, stopping any over-luxuriant shoot. Some of the plants may require a second and even a third shift during the season, which should be given the moment it is perceived to be needed. After the plants have perfectly ripened their wood, and have formed their flower-buds, they may be gradually hardened off and removed to a rather shady situation where they can be protected from storms and heavy rains. When cold weather sets in they should be removed to their winter quarters; and although they will not require much water at this season, they must never be allowed to get dry at the root. It would be well previous to placing them in their winter quarters to turn them out of their pots, in order to seek for worms, and also to see if the roots are in good condition, for a plant is sometimes allowed to get so dry that the water will not penetrate the ball, but will run down the sides of the pot. In this case the plants should be placed in a tub of water until the soil is thoroughly soaked through. If a regular succession of bloom is the object aimed at, the plants first excited into growth should be properly labelled, so as to indicate their time of introduction into heat, &c., and these plants should be commenced at exactly the same time the following season, the next succession as before, and so on in rotation. If this is properly attended to, a beautiful display of these lovely flowers may be had all through the dull periods of the year. *J. R.*

Culture of the Fuchsia.—This useful plant is, I fear, seldom employed now for decorating the greenhouse and conservatory, and therefore its cultivation has of late years been unfortunately much neglected; for in one place where you will find a well grown specimen, in 20 you will get them more like Broom bushes than properly managed plants. I therefore beg to offer a few remarks on the mode of culture which I pursue. I start my early Vinery about the 1st of January at 45° Fahr., and I place a few of my best ripened Fuchsias in it, choosing the oldest of my plants for the purpose. I syringe them over-head morning and evening with tepid water, which I also apply to the Vines. Under this treatment, in the course of a fortnight or so they begin to show symptoms of growth; I then raise my house to 50°, after which they push vigorously. I now take cuttings off all I can, and, having a bed made previously for their reception, I insert them in a compost of leaf-mould and silver sand, taking care to drain the pots well. I also put about half an inch of white sand on the top of the pot; this keeps the soil open round the neck of the cutting, and prevents damping off, which Fuchsia cuttings are apt to do at this season in mould alone. Supposing my cuttings to be struck now, I pot them off singly into 3-inch pots, in a mixture of leaf-mould, a little well-decomposed cow-dung and some sand, watering them sparingly. I then place them in a slight bottom-heat, where they soon make a start, and if all goes on well they will soon be 6 inches high, when I shift them into a 5-inch pot in a compost of rich turfy loam, rotten cow-dung, a little leaf-mould, and sand. I now bring them to the Vinery, keeping them close up to the glass; they now reap the benefit of their shift, and become strong and vigorous, throwing out laterals or side shoots in abundance. About this stage I apply a small stake, to which I tie the leader very loosely. The side shoots now make rapid progress, and when they have attained the length of two or three joints, I pinch off one, leaving one or two, according to the length of the joints. In this way I double my side shoots. I now give a little weak liquid manure, made of sheeps' dung, if that can be got; I give them this twice a week, which invigorates them, and makes them push fresh laterals, which I again pinch, tying the leader to the stake as it grows. By this time the pot will be pretty well filled with roots. I now give them their final shift for the season, using a 10-inch pot, and good rough compost, consisting of turfy loam and cow-dung, in equal parts, mixed with a little leaf mould. By the beginning of August I have got pretty tolerable plants; I therefore let them come into bloom, watering liberally with manure water, and putting a slight mulching of cow-dung on the top of the pots. They will flower till the end of October, or middle of November. I now have the foundation laid for specimen plants the following season. After they have done flowering, I store them in an empty pit, giving only as much water as will keep them alive till spring. Next year they get the same treatment as last, and by these means I succeed in getting plants which are the admiration of all who see them. *B.*

Miscellaneous.

Prevention and Destruction of Vine Mildew. By T. J. Herapath.—The substances with which I have experimented are:—1. A solution of the super-sulphides of calcium, made by boiling together quick-lime and an excess of sulphur, and afterwards diluting with water to the necessary degree. 2. A weak solution of the super-sulphide of sodium. 3. A solution of the hypo-

chlorite of lime, prepared by digesting the common bleaching powder of the shops in water; the powder being used in the proportion of about three ounces to the gallon of water. 4. A sulphuretted alkaline soap, made by a process to be hereafter described. Solutions Nos. 1, 2 and 3, effectually stayed the progress of the disease, but their application was found in practice to be attended with one great inconvenience; that is to say, the solutions did not attach themselves readily to the surface of the fruit; the thin film of waxy matter with which the latter was covered being found to exert, so to speak, a repellent action towards the fluid, which flowed off again without wetting it. This difficulty was only overcome at the cost of much time and trouble. With the alkaline soaps, however, the case was very different. This solution was easily applied, and spread itself readily over every part of the fruit, and moreover proved more destructive to the fungi than any of the other substances before alluded to. I am hence induced to give the preference to it. The mode by which I prepare it is as follows: I take equal parts by weight of common yellow and soft soap, dissolve them in boiling-water in a saucepan over a slow fire, taking care to stir the mixture occasionally with a stick, and then allow it to cool. To this saponaceous liquid I then add milk of lime, in small quantities at a time, until curdling is no longer produced. The clots of stearate and margarate of lime thus formed are next removed by straining the liquid through a piece of coarse towelling, and the clear solution which passes through is then boiled for a short time with a little flower of sulphur; the latter being used at the rate of a quarter of an ounce to the four pounds of the mixed soaps. So soon as the sulphur is completely dissolved, a sufficient quantity of water is added, and the mixture is ready for use. One pound of the mixed soaps will make about four gallons of the preservative fluid. This may be distributed over the diseased Vines either by means of a hand syringe or an ordinary garden pump. It is sometimes preferable to dip the Grapes by hand into a basinful of the composition, and paint over the stems and young shoots affected with a common brush. If under glass, one application suffices; but I have not yet had an opportunity of ascertaining if this is the case with out-of-door Vines. Before applying the preparation to the great bulk of the Grapes, it is advisable to try one or two experiments with a separate bunch, in order to ascertain if the composition is too strong. When such is found to be the case, of course all that is necessary is to add more water. *Abridged from the Chemist.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

CONSERVATORY AND GREENHOUSE.—Maintain a night temperature in the mixed conservatory of about 45°, taking advantage of fine days to increase it to 55°, but give air at the same time, to keep the atmosphere sweet and to prevent damp. Go carefully over the plants every morning, and remove any decaying leaves or flowers as soon as they are perceived, for no amount of floral display will render a house agreeable unless order and neatness are carefully maintained. As soon as the beauty of any of the pot specimens is over, remove them to some suitable situation, supply their places with others in full flower; and at this season, when other parts of the garden are so devoid of attraction, spare no effort to render this house as agreeable and effective as possible. Examine the state of the beds and borders, and see that the soil is not allowed to become too dry, for although very little moisture at the root is required by plants growing in beds at this season, it is advisable to avoid letting the soil become excessively dry, as when that is the case it is not soon got into a properly moist state. If it should be found necessary to water the beds, choose a bright morning, and give a good soaking, using sufficient fire heat to allow a gentle circulation of air to be kept up day and night, so as to prevent the injury to the delicate blossoms which might occur from keeping the house close while the atmosphere is loaded with moisture. Attend to maintaining a constant supply of flower by introducing into gentle heat proper quantities of the various plants suitable for forcing into early blossom, such as Azaleas, Rhododendrons, Kalmias, Dutch Bulbs, Roses, &c., of which every person who has a conservatory to keep gay at this season should have a stock of well prepared plants, proportionate to the demand. Camellias, and other plants that have done flowering, and are pushing their buds, should be properly cleaned, repotted, and placed in a moist growing temperature, to encourage them to make early growth. Camellias delight in a moist shady situation while making their growth, and will be quite at home under the shade of Vines, but they should not be placed in a temperature above 55° until the buds are started, for these will break irregularly, and the growth will be weak and thin if the plants are forced prematurely into growth, and the same holds good in the case of all plants. Where the greenhouse contains a general collection, as it too often of necessity does, considerable care will be requisite at this season to manage it so as to render it suitable for its various inmates; for what are generally termed hard-wooded greenhouse plants should be kept cool, and allowed the freest possible circulation of air; whereas, soft-wooded plants, such as Pelargoniums, Cinerarias, &c., require a temperature considerably higher and closer than would be conducive to the well-being of hard-wooded specimens. But by arranging so as to have the soft-wooded plants together in the warmest end of the house, where air should be admitted only on favourable occasions, or when it may be absolutely necessary to dispel damp, and by careful management, very much may be done towards properly accommodating in one house plants which require somewhat different treatment. It is very much better, however, to have a separate small house or pit for soft-wooded plants, than to attempt to grow them in the ordinary greenhouse.

FORCING DEPARTMENT.

VINERY.—Use every precaution to induce the buds to break strongly and regularly, for unless this is secured wood will be weak, and this ought to be avoided by every possible means; for if strong short-jointed wood is not secured good crops cannot be expected. Do not let impatience induce you to raise the temperature above 55° by night, or 65° by day, until the buds are fairly broken, and be particularly careful to guard against all undue excitement, whether arising from the neglect of the fireman, or from whatever other cause. A little time lost now in securing strong wood will be easily overtaken after the berries are set, without injury to the wood or crop. When the buds are fairly broken, the night temperature should range about 60°. Maintain a regularly moist atmosphere, but avoid syringing on cold cloudy afternoons where the young foliage is making its appearance, and take every possible opportunity of admitting gentle currents of fresh air. PEACHES.—Maintain a steady night temperature of about 55° where the trees are in blossom, and discontinue syringing until the fruit is set, but keep the borders and passages regularly sprinkled so as to secure a soft moist atmosphere, and admit air freely whenever the state of the external atmosphere will admit, but avoid cold currents of frosty air. FIGS.—See that trees planted out are properly moist at the root, and also keep those in pots or tubs carefully supplied with water. Any excess as respects the presence or absence of moisture at the root is very dangerous after the appearance of the fruit, and is the frequent cause of its dropping off. Maintain a moist atmosphere, and admit air freely on mild days. Let the thermometer range from 60° to 65° by day, and 50° to 55° by night.

FLOWER GARDEN AND SHRUBBERIES.

Finish pruning summer and Hybrid Perpetual Roses, and get the beds manured and dug; but Chinas, Teas, and other delicate sorts will be better left unpruned for some time longer. In digging the ground amongst Roses, be careful not to injure the roots. The borders of young shrubberies should be dug at once, where not already done, and leaves, &c., collected. Proceed vigorously with alterations during the present favourable weather, so as to be able to get the place into order, which can hardly be the case during the progress of alterations, and also to allow of giving undivided attention to the pressure of routine work, which if allowed to fall behind at this season will not be easily overtaken. Look round masses of American plants and see whether any of the more delicate kinds are being overgrown; and if so, prune away the stronger growers, or if desirable to remove any of the plants to other situations, this may be done without the smallest risk, for the roots of these plants seldom extend far; hence they may be transplanted at almost any age or size without any injury. Where any of the walks or lawns are found to be in want of draining, this should be done at once, and when such work is in hand no expense should be spared which may be necessary to do it efficiently.

KITCHEN GARDEN AND HARDY FRUIT DEPARTMENT.

As soon as the ground is sufficiently dry to work comfortably make a small sowing of Radish, also of Early Horn Carrot and early Dutch Turnip, and a small breadth of Parsley may be got in if necessary, choosing a warm sheltered border where the soil is rather light and not over rich. Where the winter Lettuces have been injured by the late severe weather it will be advisable to prepare a frame for raising a supply of these and other things, as Cauliflowers, to succeed those in frames. The frame should, if possible, be placed on a bed of leaves of sufficient thickness to afford a bottom-heat of about 65° or 70°, and the leaves should be covered with about 6 inches of sifted soil. Here the plants can be better attended to with air, &c., than if they were raised in pans or boxes in the forcing houses, but where such a convenience cannot be commanded, the best possible shift must be adopted, and with attention to keeping them near the glass, and removing them early to a cool place, there will be little difficulty in securing strong robust plants in a short time. Attend to keeping up a succession of French Beans, and use the syringe freely on those growing in the forcing houses, as they are particularly liable to the attacks of red spider. Also introduce roots of Asparagus, Seakale, and Rhubarb into heat at regular intervals, so as to secure a constant supply. Rhubarb and Seakale do perfectly well on a shelf, or the floor of the Mushroom house, which is probably the cheapest and most convenient method of forcing them. Proceed with pruning and nailing on every fine day. It is of great service when the ground is wet to provide planks or boards for the men to stand upon, which keep them from treading the borders, and also greatly assist in preventing the suffering from cold feet too usually endured at this work during cold damp weather.

COTTAGERS' GARDEN.

If any digging or trenching remains to be done, get this finished as soon as possible, but avoid getting upon the ground when it is excessively wet. Also get the Currant and Gooseberry bushes pruned, the ground dressed and dug, and proceed with any operations necessary to be done, in order that neatness may prevail everywhere. Make a sowing of early Conqueror Peas in the most sheltered part of the garden, on a bit of dry not over-rich ground. Sow rather thickly in drills about 3 inches deep, mixing with the seed some chopped Gorse, which will assist in preventing the ravages of mice. The drills should be 6 feet apart, and the intermediate spaces should be planted with early Potatoes.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON

For the week ending Jan. 26, 1854, as observed at the Horticultural Gardens,

January.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Min.	Mean	Of the Earth 1 foot deep.	2 feet deep.	Wind.	Rain.

Satur. 4	44.7	33.1	38.9	12	0.31	3	4	2	1	6	7	4	2

The highest temperature during the above period occurred on the 3d, 1850—therm. 57 deg.; and the lowest on the 4th, 1830—therm. 12 deg.

Notices to Correspondents.

AQUILEGIAS: *A H.* Of Aquilegia Durandi and californica we know nothing; they are probably nurserymen's names. A. grandiflora is a variety of either A. alpina or glandulosa, and no doubt partakes of their habits.

BOOKS: *W G G.* The French periodicals contain much useful matter. That which suits England is usually translated in our columns. All foreign booksellers can supply such works.—*J T B.* If you will explain what you mean by "botanical purposes," we will advise you; but no answer can be given to such a vague enquiry.—*A Sub.* We suppose the best books on Cucumber and Melon growing are those by Moore and Mills. The first is called "Theory and Practice applied to the Cucumber," and is published by Groombridge; the second is a "Treatise on the Cucumber and Melon." The first has no plans, the second has what is a sufficient guide to a workman.

CAPE BULBS: *Rudolph.* You had better pot them at once in fibrous loam, and place them in your greenhouse, keeping them dry till they begin to grow. Afterwards treat them as you would Hyacinths. When they have finished their growth and ripened their foliage, keep them dry; and when they begin to move again, shift them into fresh compost. You will find good instructions on the growth of Brunsvigias in our volume for 1850, p. 581.‡

CUCUMBERS: *Sub.* The bitterness of which you complain, doubtless results from your not growing them quick enough.‡

FERNS: *Scotia.* Apply to Mr. Sims, Foots Cray, Kent.

FRUIT: *T U L.* Botanically speaking this term is applied to the ripened pistil, whatever be its texture, size, colour or quality. Thus a grain of Wheat is as much the fruit of the Wheat plant, and the Acorn of the Oak, as the Apple is of the Apple tree. Nuts, of course, are fruits; but not Brazil Nuts, or Sapucaya Nuts, all which are seeds, just as the Almond is the seed, not fruit, of the Almond tree.

ICE IN CASKS: *D.* Break it every night, as well as every morning.

NAMES OF FRUITS: *X.* Your Apple is not known; it is firm fleshed, keeps well, and a good kitchen Apple, suitable for your part of the country; but it cannot be recommended as a dessert Apple.

NAMES OF PLANTS. We have been so often obliged reluctantly to decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Erzerum.* 828, Cerasus Laurocerasus; 1020, Pyrus edulis; 850, Pyrus sinaica? 692, Cratægus monogyna; 1035, Cotoneaster Fontanesiana; 553, Alchemilla vulgaris; 554, Alch. sericea; 1057, Comarum palustre.—*C L P.* 1, Barkeria elegans; 2, Lælia rubescens.—*Agnes.* We fear they are all named wrong. You will know next week, although we decline naming cryptogamic plants.

OAK TREES: *Quercus.* You cannot heap solid materials on the roots of any hardwood trees to any depth, without bringing on ill health and eventually killing them. It is useless to build a wall round the stem, because no important roots are there. The chief absorbents lie beyond the circumference of the head.

TIMBER: *Acorn.* Of the timber you name, the relative merit is expressed by the order in which they here follow:—1, Larch; 2, Spruce; 3, Scotch; 4, Silver; 5, Pinaster. The last is never of any value; the others vary in quality according to climate, soil, and situation. Scotch is excellent in Scotland, though not much esteemed when produced here in the low lands.

THE DEODAR: *A P.* This tree appears to suffer from nothing except snow, which sometimes breaks it down, as it occasionally will all evergreens. Of course, in dry slaty soil it will not grow so fast as in rich alluvial land; but it is in such as the former that we must expect it to produce timber similar to that which it is said to form in India.

THERMOMETER AND BAROMETER: *A B.* A Six's thermometer fixed, facing the north, to a post on an open lawn, would be affected by the heat of the post when the latter became heated by the sun's rays, but this you may prevent by shading the post itself; and you may also secure the instrument so as to be an inch or so from contact with its support. In the weekly returns given in the *Chronicle* the readings of the barometer are reduced to 32° Fahr. by Prof. Schumacher's Tables, which you will find in a "Report of the Committee of Physics, including Meteorology," and approved by the Royal Society published by Richard Taylor, Red Lion Court. Correction are also made for capacity, and for capillary action.‡

WORMS: *Watchful.* Lime water will clear your pots of them, and will not injure the plants; but water in any form, whether holding lime in solution or not, will produce disease at the time of year, unless you can give plenty of air and a little dry heat.

MISC: *A Lady.* Mr. Maund's address is B. Maund, Esq. Bromsgrove.‡

MANURES.—The following Manures are manufactured at Mr. LAWES' Factory, Deptford Creek:—

Turnip Manure	... per ton	£7 0 0
Superphosphate of Lime	„	7 0 0
Sulphuric Acid and Coprolites... ...	„	5 0 0

Office, 69, King William Street, City, London.

N.B.—Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia.—Sulphate of Ammonia, &c.

PERUVIAN GUANO, the guaranteed import of Messrs. ANTONY GIBBS AND SONS, Lobos Island Guano, Superphosphate of Lime, and all Artificial Manures, Linseed and Rape Cakes, &c.—WM. INGLIS CARNE, 10, Mark Lane, London.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desirous of receiving instructions in Chemical Analysis and Assaying, will find ample facility and accommodation at the College.

PEAT MOSS CHARCOAL, AND OTHER MANURES.—The Undersigned are appointed sole Agents by the Peat Moss Charcoal Company, for the sale of this valuable fixer and distributor of ammoniacal matter.

Also on Sale, Peruvian Guano, Superphosphate of Lime, Gypsum, Nitrate of Soda, Bone-Dust, Sulphuric Acid, and all other Manures of known value.—Apply to MARK FOTHERGILL & Co., 204A, Upper Thames Street, London.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained from the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 60*s.* per ton, and in quantities less than half a ton, at 4*s.* per cwt., for ready money only, and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage.

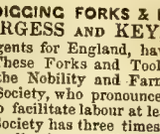
It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, and from all the other Agents of the Company. Recommendations and Testimonials may be seen at the Works.

ANTHONY'S PATENT AMERICAN CHURN.—Extract from the Royal Agricultural Society's Report of the trial of Churns at the Gloucester meeting in July last. "In this trial the American Churn not only maintained its character in producing butter rapidly, but in producing a greater quantity from the like amount of cream." It made from 4 quarts of cream 4 lbs. 6 oz. of butter, being 8 oz. more than any of the other Churns from the same quantity and quality of cream. Price Lists of Churns and Implements by the best makers sent free, and Illustrated Catalogues on receipt of eight postage stamps. BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, London, who have always a large stock of Steam-engines, Ploughs, Harrows, Diggers, Waggons, Carts, Threshing and Dressing Machines, Mills, Oat and Grain Bruisers, Oilcake Breakers, Reaping Machines, Haymakers, Horse-rakers, Turnip Cutters, Liquid Manure Carts, Parkes' celebrated Steel Digging Forks and Draining Tools, Pumps for Manure, Farm Fire Engines, and for Garden Purposes, &c. &c.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, and 52, Little Britain, London.

PATENT ROOT GRATING MACHINE.



BUSHE & BARTER'S PATENT ROOT GRATING MACHINE, Manufactured and Sold by ALEX. SHANKS & SON, Arbroath, Forfarshire, from whom particulars, with prices, may be had.—Arbroath, Jan. 28.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

REDUCTION IN PRICE.

WEIR'S IMPROVED GALVANISED WROUGHT IRON LIQUID MANURE PUMP.

The Fittings of these Pumps are wholly of Brass, and there is no leather or other matter which can be affected by the manure.

Price, complete, with 10 feet Flexible Suction Pipe, 4*l.* 15*s.*
Terms, cash on delivery.

EDWARD WEIR, Agricultural Engineer, 16, Bath Place, New Road, London. Removed from Oxford Street.

Catalogues, with Illustrations, sent free by post.

WARNER'S PATENT FARM AND COTTAGE PUMPS.

Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

	£	*s.*	*d*
Patent Pump	1	15	0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3	0	0

Larger sizes if required.

The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

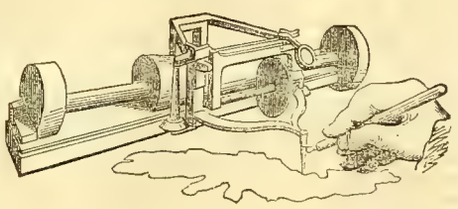
JOHN WARNER & SONS,

8, CRESCENT, JEWIN STREET, LONDON.

Every description of Machinery for Raising Water; Fire Engines, &c.

An Illustrated Book sent on application post free.

TO SURVEYORS, ARCHITECTS, & ENGINEERS.



SANG'S PLATOMETERS; OR, SELF-ACTING CALCULATORS.—These Instruments tell accurately the contents of figures drawn on Maps. They effect a great saving of time and labour, as in order to find the area it is only necessary to lead a tracer round the outline of the figure, however irregular it may be. Price 10*l.* each. Sold by JOHN SANG, Kirkaldy.

GALVANISED WIRE GAME NETTING.—7*d.* PER YARD, 2 FEET WIDE.

	Galvanised.	Japanned iron.
2-inch mesh, light, 24 inches wide ...	7*d.* per yd.	5*d.* per yd.
2-inch „ strong „ ...	9 „	6½ „
2-inch „ extra strong „ ...	12 „	9 „
1⅝-inch „ light „ ...	8 „	6 „
1⅝-inch „ strong „ ...	10 „	8 „
1⅝-inch „ extra strong „ ...	14 „	11 „

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised Sparrow-proof Netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.

Manufactured by BARNARD & BISHOP, Market Place, Norwich; and delivered free of expense in London, Peterborough, Hull, or Newcastle.

CHEAP WIRE GAME & POULTRY NETTING, 5*d.* per running yard.

GALVANISED DITTO, 7*d.* per running yard, 2 feet wide.

	Galvanised.	Not Galvanised
24 in. wide, 2 in. mesh,	7*d.* per yard.	5*d.* per yard.
30 in. „ 2 in. „	9*d.* „	6½*d.* „
36 in. „ 2 in. „	10½*d.* „	7½*d.* „
48 in. „ 2 in. „	1*s.* 2*d.* „	10*d.* „

Sparrow Proof Netting, Galvanised, 3*d.* per square foot, made to any size for the same proportionate price. This article was shown at the Great Exhibition, where it was so much admired for its light and durable appearance, and acknowledged to be the cheapest and best article of the kind ever offered. Extra strong Wire Sheep Netting, 3 feet high, 1*s.* 6*d.* and 2*s.* 3*d.* per yard. Also every description of Flower Trainers, Dahlia Rods, Garden Arches, Bordering, Flower Stands, Tying Wire, Trellis Work, Invisible Wire Fencing, Hurdles, and every description of Wire Work for Horticultural purposes.—Illustrated Catalogues of Patterns forwarded, post free, on application to T. H. Fox, City of London Wire Work and Iron Fence Manufactory, 44, Skinner Street, and 6 and 8, Snow Hill, London.

TO LANDOWNERS, SOLICITORS, ESTATE AGENTS, ETC.

THE LANDS IMPROVEMENT COMPANY, incorporated by special Act of Parliament, 1853, having perfected their organisation, are prepared to receive applications for the execution of improvements, under the provisions of their Act.

The Act extends to England, Wales, and Scotland; and empowers persons in the actual possession of lands, or in receipt of the rents, such as tenants for life, trustees, bodies corporate, incumbents of benefices, mortgagees in possession, guardians of infants, &c., to effect substantial improvements on their estates, and to convert the outlay on such improvements into a terminable annuity or rent-charge of from 14 to 25 years, at will.

The Company, acting under the supervision of the Inclosure Commissioners, will undertake and execute improvements, or will supply the capital to landowners preferring to execute improvements themselves, or will grant the powers of their Act to landowners seeking merely to charge the inheritance with the outlay on improvements from their own funds.

The Agricultural Works of Improvement particularly specified in the Company's Act, are:—

1. The Drainage of any Lands by any such means as the Inclosure Commissioners shall approve.
2. Irrigation, and Warping of Lands.
3. Embanking of Land from the Sea, or Tidal Waters, or Rivers, in a permanent manner.
4. Enclosing or Improving the Drains, Streams, or Watercourses of the Land, under the Inclosure Commissioners.
5. Reclamation of Land lying waste.
6. Making Farm-roads to the extent of one-half of the outlay for such roads.
7. Clearing Lands.
8. Erection of Farm-houses, and other Buildings required for farm purposes to the extent of three-fourths of the outlay for such Farm-houses and other Buildings.

In effecting the above Improvements there may be erected any Engines, Machinery, Engine-houses, Mills, Kilns, Sheds, Yards, Shafts, Tanks, and Reservoirs, Pipes, Conduits, and Watercourses for Irrigation, Tram-roads and other ways, Bridges, Weirs, Sluices, Flood-gates, and Hatches.

For Forms of Application and further Information apply to the Hon. W. NAPIER, Managing Director, 2, Old Palace Yard, Westminster, London.

THE LANDOWNERS' DRAINAGE AND INCLOSURE COMPANY.

INCORPORATED BY SPECIAL ACT OF PARLIAMENT.

Tenants for Life, Trustees, Mortgagees, Incumbents of Livings, &c., can have all works of Draining, Warping, Irrigating, Inclosing, and every other improvement to land, executed by the LANDOWNERS' DRAINAGE COMPANY, either by Contract or on Commission. They will provide the money by a permanent charge on the inheritance, or repayable by instalments. They are also ready to undertake the Drainage of Towns, and all works incident to such improvements. This Company having been engaged in extensive works for many years in most of the Counties in England, and having in their employ the largest Practical Staff in the United Kingdom, whose sole attention is devoted to such improvements, is the best guarantee for the success of their works.

Every information will be given at the Offices of the Company, 30, Parliament Street, London, or 9, Bedford Circus, Exeter.

THOMAS MAY, Secretary.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

PATRON—His Royal Highness PRINCE ALBERT.
PRESIDENT OF COUNCIL—Earl BATHURST.
PRINCIPAL—Rev. J. S. HAYGARTH, M.A.

PROFESSORS, &c.

Chemistry—J. A. C. Voelcker, Ph.D., F.C.S.
Geology, Zoology, and Botany—James Buckman, F.G.S., F.L.S.
Veterinary Medicine and Surgery—G. T. Brown, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. Armstrong, C.E.
Manager of Farm—G. Austin.
Assistant to Chemical Professor—A. Williams, M.R.C.S.

The first Session of 1854 will commence early in February. The annual fees for Boarders vary from 45 to 80 guineas, according to age and other circumstances. The Fee for Out-Students is 40*l.* per annum. The College Course of Lectures and Practical Instruction is complete in one twelvemonth—though a longer time is recommended. There is a department for general as well as for agricultural purposes. Prospectuses and information can be had on application to the Principal.

The GUIDE TO THE ROYAL AGRICULTURAL COLLEGE FARM may be obtained of HAMILTON, ADAMS, & Co., Paternoster Row, London; and EDWIN BAILY, Cirencester. Price 1*s.*

COLLEGE OF AGRICULTURE AND CHEMISTRY, AND OF PRACTICAL AND GENERAL SCIENCE, 37 and 38, Lower Kennington Lane, Kennington, near London.

Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

The system of studies pursued in the College comprises every branch requisite to prepare youth for the pursuits of Agriculture, Engineering, Mining, Manufactures, and the Arts; for the Naval and Military Services, and for the Universities.

Analyses and Assays of every description are promptly and accurately executed at the College. The terms and other particulars may be had on application to the Principal.

THE LABORATORY of the ROYAL POLYTECHNIC INSTITUTION is always open for the reception of pupils, under J. H. Pepper, Esq., F.C.S. A.C.E. &c. Careful Analyses and Assays of Soils, Minerals, Waters, Mercantile or Agricultural Products are performed with despatch, accuracy, and economy.

For terms apply to Mr. R. I. LONGBOTTOM, Secretary.

HEXHAM POULTRY SHOW.—The SECOND ANNUAL EXHIBITION for Promoting the Improvement of POULTRY, will be held at Hexham, on FRIDAY and SATURDAY, the 12th and 13th days of May, 1854.—Further Particulars will be given on application to Mr. WILLIAM TURNER, the Secretary, Hencotes, Hexham.

The Agricultural Gazette.

SATURDAY, JANUARY 28, 1854.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, Feb. 1—Agricultural Society of England.
THURSDAY, — 2—Agricultural Imp. Society of Ireland.
THURSDAY, — 9—Agricultural Imp. Society of Ireland.

A VERY important omission occurs in the report of the late examination at the Royal Agricultural College:—"The R. A. C. Diploma or Certificate of Merit was awarded to C. H. INGE and C. D. BARSTOW on their passing a strict examination in the whole course of subjects in every department." It is worth noting what this diploma signifies: because there is no doubt of the need of some agricultural diploma by which proficiency may be marked; and to none is it more apparent than to landed proprietors in search of intelligent agents.

The letter on land agents in another column plainly proves the necessity of some such mark of competency for such an office; and we feel sure that this need is more generally felt than our correspondent seems to think. The ownership of land is more and more felt to be a *profession* involving management as well as mere lordship, needing therefore in the owner or his deputy something more than mere ability to secure the receipt of rents: and while some few may still give the chief offices in such management to incompetent men, who may have claims of other kinds upon them, so that these offices become at the best mere sinecures, and more generally sources of great injury to the property, the great majority see the necessity of the duties of ownership being efficiently executed, if its rights are to be secured.

One of the best proofs of the importance of some diploma in agriculture, in which all may have confidence as the trustworthy evidence of agricultural skill and intelligence, lies in the fact that it has been recognised by those in the direction of the Highland and Agricultural Society.

So long ago as 1848 they applied to Government for a Supplementary Charter to enable them to grant diplomas to agricultural students, but their petition was refused by the Home Secretary, owing to the unfavourable report of the Lord Advocate of the day; a gentleman whose business it may have been to interpret the existing charters of the Society, and whose legal experience no doubt qualified him for such a duty, but whose agricultural intelligence, we venture to say, cannot have qualified him as a member of the Society in question, or he must have perceived that nothing could be more consistent with the aims of the institution than the powers desired in this new charter, which were to enable them to set their seal, as it were, upon the agricultural ability which they had been the means of conferring. Their plan embraced a curriculum of study for a certain number of years. The classes were:— Agriculture, Chemistry, Botany, Natural History, Veterinary Surgery, and we believe Surveying. Attendance at these classes in any University would have been sufficient. In the absence of a model farm, residence with a practical farmer for a couple of years and his certificate were to have been required. The board of examiners was to have consisted of the Lord Justice General, the President of the Society, and one or two other extraordinary members; together with the professors of the classes we have mentioned in the University of Edinburgh, a certain number of the directors of the Society, and a certain number of practical farmers, along with the veterinarian lecturer of the Society. We believe that the application to Government was unnecessary; and that, with the co-operation of the professors, the Society might at any time establish a board, examine students, and grant diplomas, as in the case of their veterinary college, where such diplomas are recognised by the Horse Guards and by the India House. But be this as it may, what could have more effectually marked the agricultural standing of any man than a diploma of the kind described? and what could have greater influence in determining the choice of candidates for any office in which agricultural efficiency was required? It is not too much to say that the whole character of British agriculture would improve under a system which should give good eyesight in this way to landowners in the appointment of their deputies.

Since the failure of the Highland Society in connection with this subject, we are glad to know that the Royal Agricultural College has for the last two or three years granted its diploma to such of its students as were worthy of it; and that our readers may understand what degree of intelligence and ability is required to render them worthy, we will just state the kind of examination which they have to undergo.

The object in the examination for the College Certificate is to determine an acquaintance with the whole course of studies pursued at the College, excepting those which are merely auxiliary and only undertaken from the necessity of supplying occasional deficiencies in early education. For instance: mathematics and arithmetic would not be subjects of examination, except indirectly, in such subjects as required mathematical or arithmetical calculations. The candidates are not pitted against each other, but are expected each to reach a certain standard of proficiency in every one of the following subjects:—Chemistry—inorganic, organic, and agricultural—geology, palæontology, zoology, botany and vegetable physiology, veterinary medicine and surgery—including anatomy, pathology, and materia medica—surveying and mensuration, agricultural engineering, together with, of course, all the details of practical agriculture. This examination is conducted both on paper and *vivâ voce*. Half of it is always included in the sessional examination for the time being; and of the admirable character of these sessional examinations our readers have already for several years had full opportunity of judging. We have the papers for the past year before us now, and perceive that, without any approach to sameness, they preserve their character as really admirable counterparts to a remarkably well-selected mass of the most important facts in the great range of agricultural practice, and in the sciences which it illustrates. This sessional examination will thus always supply a sufficient criterion of the proficiency of the candidates for the diploma of the college up to a very respectable status indeed.

Practically, therefore, the four professors and principal, who are the examiners, only examine separately on one half the year's subjects, taking the result of the sessional examination as their criterion as to the other half. A report from any *one* of these that a student has done *badly* in his department, is fatal to success. A report of *middling* proficiency in one department is not fatal, if the others are particularly good. There have been given six certificates during the past three years. It is rarely gained after only one year's residence, so that full knowledge of the art of farming, as well as of the theory of agriculture, is thoroughly insured.

A diploma* thus secured must, it is obvious, mark out its possessor as being also in possession of such a degree of agricultural intelligence as would fit him for the management of land either for himself or others. When it shall be conferred upon the student by a body of examiners altogether unconnected with the College, as it is ultimately, we believe, intended to be, this diploma will still further, we doubt not, secure that public confidence of which it is already worthy.

We have, we believe, said enough to prove the need of some such mark of proficiency in agriculture as other professions require and possess, and while we have shown that the Highland Society has tried, and still, we believe, desires to appoint some board whose certificate would have the desired weight, we have also so far detailed the constitution and methods of such a board of examiners in the college at Cirencester as may serve to give public confidence in those who there obtain the diploma which is to mark them in public esteem as efficient agriculturists.

ARTERIAL DRAINAGE being a subject of considerably wide range and minute ramification, we have not hitherto hemmed in our observations within home limits; and having already spoken a word about Assyrian drainings on the plains of the Tigris and Euphrates, about Roman enterprises in the Pontine and other marshes, and some of the more modern Italian applications of true hydraulic engineering,—we must just advert to the banks of the Nile, before stepping over into the dyke-defended Polders of Holland. However, should the business-reader object to our antique references, which send him almost to his old school LEMPRIERE, for the whereabout of the "Fen of Lerna," we can only remind him that DUGDALE, the standard drainage historian, actually goes back to the book of Genesis, citing the command "Let the waters be gathered together, and the dry land appear," and also the fact of the merciful assuaging of the deluge, to prove the *Divine institution* of works of draining!

In turning to a country without rain, whose fertility depends rather upon irrigation than drainage, we are reminded that not simply an evacuation of drain-water, but an entire command of the water, either for draining or flooding, is indispensable to a perfect agriculture. In what way did the Egyptians obtain this?

Now, the valley of Egypt is *not* a tract of corn land open to the overflowings of its great river. It is, for the most part, a narrow valley, many hundreds of miles long, but only a few leagues in breadth, flanked by barren mountains and deserts of sand. Through it flows the Nile, half to three-quarters of a mile wide, swollen in *summer* by the melting snows of its native mountains, but restrained along almost its whole course by artificial embankments. The contiguous lands are watered from it by machinery; while innumerable canals lead the water to the parts more remote. That portion of the valley called "Lower Egypt" expands into a great delta of marshy land toward the sea; and here the river, never many feet below the surface of the ground, periodically inundates and summer-warps the unguarded plain, enriching the unctuous soil from its slimy flood. The drains and banks of Lower Egypt, and especially of the Delta, are said to have been considerably increased by SESOSTRIS, in the 17th or 18th century, B.C.; and notwithstanding the obliterations of subsequent ages, about 80 of the canals yet remain—all excavated by manual labour, and several of them 60, 90, and even 120 miles in length. They receive the inundation of the Nile, circulating through the country the waters which had formerly overflowed and stagnated on it. The large lakes of Mœris, Behire, and Mareotis, formed vast reservoirs for containing surplus water brought into them by great canals; and this was again conducted by canals, as required, over the adjacent plains.

The Egyptian cuts were for two purposes—the discharge of excessive water as well as the disposal of what might be useful. Hence, besides those of the latter order, many auxiliary outlets were made to assist the Nile outfall — the natural mouths having proved insufficient for the drying of the country. HERODOTUS, describing the several mouths, says—"But the Bolbitic and Bucolic channels are not natural, but made by digging." The ruins of immense embankments still remain; some of which were for curbing the rise of the Nile, some for the defence of cities against the inundations, and others for opposing the torrents of sand which are blown from the Great Desert. The kings did not wear out all their slaves and captives in piling pyramids and Carnac palaces, hollowing hills into temples, and carving miles of colossal sphinxes; they expended lives and treasure in labours of industrial improvement, so that the names of SESOSTRIS, MŒRIS, PHARAOH NECHO, the PTOLEMIES, DARIUS, and ALEXANDER, are connected with works of drainage or irrigation. Of one piece of engineering—a canal for navigation, joining the Nile with the Red Sea—we read that, in digging it, there perished 120,000 Egyptians. The PTOLEMIES, kings of Egypt, completed it; and (according to STRABO) "set a *sluice* upon the channel, that they might sail out into the sea, and in again, as they pleased. It was 100 cubits in breadth, and deep enough for a large ship." Although it is in the application of machinery to the purposes of agriculture that the Egyptians have set the most wonderful examples, still, it seems, their "arterial" works were of a magnitude sufficiently surprising even to a Hollander or an English fen-man. And now that health no less than hunger is urging us to better our system of semi-discharging drains and dilatory rivers, we shall surely be ashamed to allow "water interests" or any other obstacle to damage lands which Egyptians thousands of years ago would have drained and irrigated had the thing been necessary. *I. A. C.*

PROFITABLENESS OF CATTLE FEEDING.

IN my statement in your publication of December 24 it will be observed that, in the tabular form of food with results, I give the gain of weight as accounting for the whole of the deficiency of nitrogen shown in the excrement, as compared with that computed in the food supplied. To those who have given their attention to this subject it will at once be obvious that this will show a much more than due proportion of nitrogen to the weight gained. I have now to explain that the analyses of the various descriptions of food were not those of the food actually supplied, but such as I found in different publications. I gave the per-centage of nitrogen in Rape-cake at 5 per cent. I recollect observing one analysis at about 4½; and Mr. Lawes, in No. 2 of your *Gazette*, January 14, states it at only 4 per cent. It is of great interest to trace and account for the properties and effects of the food; but no precise result can be arrived at, except by a careful analysis of the food itself, which is scarcely within the reach of the farmer, but which I think deserving the attention of our agricultural societies. There is also said to be an escape of nitrogen from exudation, which Boussingault computes at 400 grains per day from each bullock. It is proper, too, to state that the heifers under treatment were young, being but 2 to 2½ years old when purchased, up to the time they were sent off they would be increasing both in muscle and bone.

I now proceed to compare my treatment of cattle with that of others, and I select for this purpose those of Mr. M'Culloch (lots 21 and 22), and those of Mr. George Hope, of Fenton Barns, both given in the Royal Highland Society's Journal. My mode consists in inducing my cattle to consume as much straw as I can, with a limited supply of cake or other concentrated food, thereby reducing their requirements in Turnips to from 50 lbs. to 60 lbs. per day for each animal. The treatment with which I draw the comparison is to give but a limited supply of straw with an abundant one of Turnips, and without other artificial food. Mr. M'Culloch, in the example I have stated, supplies each of his cattle with 150 lbs. Turnips, and 7 lbs. straw; together, 157 lbs. per day. Mr. Hope, 178 lbs. Turnips, 5 lbs. hay, with straw; together, 183 lbs. per day. My own as per tabular statement, 60 lbs. Turnips, 28½ lbs. hay, with straw; together, 88½ lbs.; being rather more than one-half of the former (Mr. M'Culloch's), and less than one-half of the weight of the latter (Mr. Hope's supply). On reducing these quantities to water and dry material the comparison will be—In Mr. M'Culloch's treatment, 135 lbs. water, 21½ lbs. dry; together 156½ lbs. Mr.

* The certificate, we may mention, is on a large ornamented piece of vellum, with suitable inscriptions, and is signed by the President, Vice-President, Chairman of Council, Principal, and by each of the Professors.

Hope's, 160 lbs. water, 22½ lbs. dry; together, 182½ lbs. My own, 60¾ lbs. water, 27¾ lbs. dry; together, 88½ lbs. Taking into account that in my treatment 15 lbs. of shells of Oats and inferior hay, which contain about 50 per cent. of woody fibre, which is said to serve no other purpose but that of filling, whilst in the other instances only 7 lbs. or 5 lbs. of straw are given, the remainder being Turnip, which has only 20 per cent. of fibre, the amount of dry food serviceable for nutrition will in each instance more nearly approximate.

My practice is to offer my cattle, under whatever treatment, water each day. In the experiment under notice the water was previously weighed; it will be seen that in addition to that supplied in the Turnips they took mixed with the shells of Oats and alone, about 5 lbs. each, many of them refusing to taste the water alone. Admitting that my cattle, with 61 lbs. of water per day, are supplied to the extent it is serviceable, it follows that in the mode of treatment with which the comparison is made, the cattle will be supplied with more than double or nearly treble what they require. My experiments tend to show that whatever element of food is supplied, more than is necessary or serviceable goes to the excrement or manure; it is evidently true as regards nitrogen, phosphates, and other minerals, and I do not see that it will be otherwise in regard to carbon and water; the result will then be a more than double quantity of excrement during the same time, and from the like number of cattle, without any increase in its value; reckoning each beast to consume 1 cwt. per day more of Turnips, it would, for 20 head of cattle, require 7 tons more of Turnips per week, which are to be gathered, turned, and carted from the field; taking the manure to be doubled in quantity, it would to myself, who, with a very limited horse power, am precluded from applying the means introduced by Mr. Kennedy, and adopted by the spirited Mr. Mechi, be burdensome to find my 300 tons doubled in quantity without any increase in its value. To set against this extra labour is that of preparing the additional straw, which is on the premises, and the 5 lbs. of cake. I leave it to those interested to estimate the relative cost and labour of the two modes. Chemistry tells us that of azote or nitrogen, 1 lb. of oilcake contains as much as 20 to 25 lbs. of Turnips, of oil (an important agent in the formation of fat), more than 50 times as much; while of gum and other heat-sustaining properties, this comparison, though favourable, is not so in the same degree; still this will be compensated by the additional straw. If we take 5 lbs. of Linseed-cake to be equal in nutritive property to 1 cwt. of Turnips, valued at 9*s.* per ton, the cost of 100 lbs. will be 8*s.* 4*d.*, and will represent the like value per ton of Turnips; if we take Rape-cake, which chemistry tells us is of equal value in feeding with Linseed, and which is usually bought at 4*l.* per ton lower, then 100 lbs. will cost 4*s.* 4*d.*, and will equally represent a ton of Turnips, admitting the teaching of chemistry to be correct.

One advantage of the system of giving artificial food will be obvious. You are buying a fertilising material, enriching your land, and enabling yourself to maintain 2½ head of cattle from an acre of Turnips in place of one. There is still to be taken into account the value of straw, which varies so much in the different localities that no general estimate of it will apply. I hold no sympathy with those who think straw loses in value by going through the stomach of the animal, and I have already explained my views on the subject at some length in your Paper, No. 24, of the 11th of June.

Before I began these experiments, I had sought for information in various publications without being able to give satisfactory data applicable to my own procedure. During the experiments I have left what I had read out of sight and memory, and have instituted no comparisons. If I have made erroneous deductions or conclusions, I hope I have established my claim to be set right by some of your more competent readers and correspondents. *Y., Jan.* 18, 1854.

GRAIN FALLOWS.

Whatever doubts may exist as to the Lois-Weedon system being applicable to farms, under the management of men possessed of the ample capitals that enable them to pursue those expensive economies comprehended under the term of "high farming," there can be none of its being so to the lands held by the less wealthy tillers of the soil. This is more especially the case with Ireland, where, from deficient farming capital and neglect of house feeding, a repetition of grain crops has obtained that fills the ground with weeds. To Ireland, a system of grain fallows would be of incalculable value; to induce its reception, however, it must not only be proved to be as remunerative as Mr. Smith shows it to be, it must also be shown to be accessible to the Irish farmer, as not demanding a greater outlay than the ordinary tillage of the country. This I think may also be proved, as in the saving of seed may be found the wages of the additional labour required, although in this respect we have much to contend with in Irish prejudice, for a most lamentable distrust of the value of farm labour prevails in Ireland—"'tis enough to rob any one;" money is therefore most grudgingly laid out on it, and here the proverb is most amply exemplified "of losing a pound in saving a penny;" the general excuses are in the idleness of the labourers, and in the want of means. Both have perhaps been much induced by the sordidness of employers; in other countries, where a reasonable stimulus to industry is given, it is a well-known fact that the Irish labourer is not an idler; but here, a *minimum* of payments being the principle on one side, it will not excite much surprise if a *minimum* of returns be the rule on the other side. An eye service—a supineness in labour—has therefore obtained. This has become a habit, which at home, where there is no mixture of greater diligence to stimulate to exertion, perhaps nothing can immediately overcome; the want of sufficient food also diminishes the natural energies of the labourer. In the low returns superinduced by this under labour, this slurring over of all field operations—and we are to recollect the deficiency of labour is in no way made up for by manuring—we can find a sufficient cause for a want of means to employ labour. But while the Irish farmer grudgingly employs labour, he is more than sufficiently profuse in seeding his land; he does not here find a deficiency of means, for "we must not rob the ground;" and indeed, from the foul state of the land, a very heavy seeding is necessary, that the crop may run a race on anything like equal terms with the weeds.

In the following statement it will be seen that the saving effected in the seeding of the ground is sufficient to pay for the additional labour on it, and that labour hand work. In a field of 4 acres, three-fourths of it being sown with Oats broadcast, I have this year sown a little over one acre (about 8 perches), in rows 18 inches apart, with 4 stones 3 lbs. of seed, black Bere, Chevalier Barley, Dun and Hopetoun Oats. The expenses incurred have been—

	£	s.	d.
Seed 4 st. 3 lbs., at 1*s.* 6*d.* a stone	0	6	4
Opening drills with hoe	0	3	0
Sowing and covering by hand	0	3	0
2 hand-hoeings	0	6	0
Weeding rows	0	3	0
	£1	1	4

Expenses of a broad-cast crop:—

Seed 12 stones (this is under the average) ...	0	18	0
Sowing and covering	0	3	0
	£1	1	0

There is no question of the sowed crop being superior to the crop on the rest of the field. It is indeed looked upon as being excelled by very few crops in this part of the country. The whole field is sown with Clover and Italian Rye-grass, this sowing in the drilled part being deferred till after the second hoeing; were it not for this, instead of the second hoeing, the ground would have been deeply dug between the rows, and the shovel would have been passed between them, laying the clay against the rows of corn, which would have assisted to support them, and left channels for drilling in the seed of the succeeding crop. As the ground is very stony, and surcharged with the weeds of many years' accumulation, the expenses of hoeing and weeding have been heavier than they would have been under more favourable conditions.

Let us now look upon the advantages this plan of tillage has over the broadcast. Little more than half the number of hands will reap it; from its comparative exemption from weeds the crop may be sooner carried; from its cleanliness, too, the Clover crop will be better, and the ground having by the two hoeings been kept pervious to atmospheric influence must have gained something in fertility. But in our ordinary practice this year's crop of grain would be succeeded by others, each deteriorating the land and diminishing in amount, with an annual increasing production of weeds. By pursuing this system of fallowing with each crop, we may still continue our succession of grain crops, at the same time improving the soil and increasing the return, and continually reducing the amount of weeds. Whether three rows of grain at equal distances in 5 feet breadths will or will not be more or less productive than three rows 1 foot apart, with intervals of 3 feet, will remain for future experiments, but I think it likely the general farmer will more readily adopt the equal distances, as they will not so much shock his pre-conceived notions. I believe myself that in setting apart a field for the production of grain, the equal distance of the rows is preferable to the Lois-Weedon plan. In the equidistant rows each row draws in equal proportion its supply of food from the soil and air, and the earth is loosened about each to the same extent. On the contrary, in the Lois-Weedon practice, the centre row does not receive an equal current of air with the outside rows, nor can its roots luxuriate in a soil loosened and aerified to the same depth, nor indeed do the inner roots of the outside rows. I cannot satisfy myself with Mr. Smith's three rows; the thing may answer in practice, but to me it does not seem that the centre rows are placed on an equality with the outside ones.

The farming world is much indebted to Mr. Smith; he came forward at a moment of general despondency and showed—practically showed—that the Wheat grower need not fear; he demonstrated with ocular proof, when the poor-houses were crowded with the unemployed labourers, that a greater use of manual labour, in aiding the operations of Nature, was able to confer a fertility on the soil equal to that which had usually been effected by a less judicious application of labour with the aid of various substances under the name of manures, at least for the production of grain crops. He showed the poor man how he might realise a profit from his acres equal to that of his richer neighbour. He showed him that he might sempiternally crop his Wheat soil with Wheat and throw all his manure—including the straw of his Wheat, the product of the natural causes he had brought to his aid—on the fields he appropriated to green crops, thus largely augmenting their productiveness, and, which he has still further increased by availing himself of that great law of nature of dissimilar plants appropriating in different proportions their common food. All this he has shown to the great benefit of the poor man, whose acres exceed his ability to cultivate on a higher scale of production. We want a Smith in every parish in Ireland.

Yet I do not regard the Lois-Weedon practice as the perfection of a system, I look upon it rather as the pioneer, I think much more may follow—a whole train of experiments; the first and simplest might be the introduction, as a stolen crop, of Rape either sown or transplanted in the intervals with manure, which however would necessitate a spring sown crop of grain to succeed it. Or, by adding a foot or perhaps more to the breadth of the intervals, summer crops might be interlined with the Wheat, which, by the union of labour and natural and artificial causes of fertility, might bring a return even greater, notwithstanding the increased breadths of the intervals, than Mr. Smith's. I cannot satisfy myself with an average crop of the produce of inefficient and unscientific conditions; I must have a *maximum* result or, at least, at the same time and on the same acre with the average crop of Wheat, something else equivalent to a *maximum* crop of Wheat. I have had in a small experiment at the rate of seven quarters of Barley to the acre, in double rows, 21 inches apart, with intervals of 3 feet 6 inches; I must have it on the broad acre; and by increasing the breadth of the intervals, perhaps by taking the odd 9 inches from the space between the double rows and adding them to the intervals, gain a summer crop in them. *J. M. Goodiff, Granard.*

ON THE FORMATION OF AMMONIA IN THE DECOMPOSITION OF ORGANIC MATTER.

Ammonia is a compound of hydrogen and azote or nitrogen, which does not exist, *eo nomine*, in organic subjects, either in a living or in a fresh state; but its constituents exist in them, in other combinations; and it is only as organic matter begins to decay or become decomposed, that ammonia is formed or developed. A question then arises: when ammonia is formed or developed in decomposing organic matter, is the presence of both its constituent elements necessary in the decaying substance, to its formation or development? or, if not, which of its two constituents is the one whose presence is necessary, in the decomposing matter, to its formation or development?

I think the tendency of current opinion, so accustomed to regard azote or nitrogen as the useful element in ammonia, would be to maintain that it could not be formed or developed without the presence of nitrogen in the decaying matter: but if the view I have taken in my communication of the 12th November, "On the use and purposes of ammonia and vegetable economy," be founded in truth, it becomes merely the converse of the proposition therein advocated, to affirm that, whenever ammonia is developed in the decomposition of organic matter, it is in virtue of hydrogen being contained in it; and that the presence of nitrogen in the decaying substance is not necessary for that end or purpose. By this, I do not mean to imply that both the constituent elements of ammonia may not exist at times in organic matter, in such proportional quantities as to reconstitute that substance on decomposition: or that ammonia may not be formed by the union of its constituents previously existing in the decaying matter. I merely wish to be understood as affirming that the presence of hydrogen alone is necessary in organic matter, for the development of ammonia; and that, if it be so present, ammonia will necessarily be developed in the process of decomposition, though there be no nitrogen in the decaying substance.* A simple experiment will prove this. Let a heap of vegetable matter, in which there is no appreciable quantity of nitrogen present, be subjected to fermentation or decomposition under the requisite conditions of moisture and temperature. It will be found that in the progress of decomposition a sensible amount of ammonia will be developed, making itself known by its pungent odour. Whence is this ammonia derived? Certainly, not from any nitrogen contained in the vegetable substance, since there was none, or next to none, from which it could be formed. But there was hydrogen in it, as there is in all vegetable matter, from which alone, therefore, it could have been derived. If it be asked, whence the nitrogen was obtained? I reply—from the atmosphere, into which the nitrogen was originally discharged, or given out by the plant, when the ammonia absorbed by its roots was decomposed, for the purpose of appropriating the hydrogen in the formation of its structural substance. Of course, if there be any nitrogen present in the decomposing vegetable matter, the hydrogen may as readily unite with it, as far as it will go, in forming ammonia, as with the nitrogen of atmospheric air. But that will make no essential difference in the question: for unless the nitrogen contained in the vegetable substance be in sufficient abundance to convert the whole of the hydrogen into ammonia, the uncombined or unappropriated portion of hydrogen will seek and find its complement of nitrogen in atmospheric air. It does not pass into the atmosphere in a free or uncombined state; for there are no traces of uncombined hydrogen in the atmosphere; while there are at all times abundant indications of the presence of ammonia in it. Now, as there must be immense quantities of hydrogen being continually evolved from decaying vegetable matter, does not this fact prove the remarkable

*When sulphur, for which hydrogen seems to have a ready affinity, is present in organic matter, sulphuretted hydrogen gas will also be formed.

facility or readiness with which hydrogen unites with the nitrogen of the atmosphere in forming ammonia?

The fact of ammonia being formed from hydrogen, and not from azote or nitrogen, in the decomposition of organic matter, may be shown by a reference to other facts. Take, for instance, flesh or animal fibre—a highly azotised substance—from the decomposition of which, of all organic matter, there should be abundance of ammonia formed, if nitrogen in organic matter be the source or origin of ammonia. But does the result correspond with the hypothesis? or, are the gases given off by putrid or decomposing animal matter at all indicative of the formation of ammonia? Take, again, the excreta of animals, which being merely the refuse of their food, after supplying the wants of the animal system, must partake of the nature and properties of the substances they eat—are the excreta of strictly carnivorous animals, or even of those whose food is of a mixed or partly vegetable character, as rich in ammonia-producing matter as the excreta of animals whose food is derived entirely from the vegetable kingdom? An apparent difficulty, I am aware, is suggested by the properties of guano, which generally contains a very noteable proportion of ammonia. This substance is considered as the excrementitious deposit of sea-birds, deriving their subsistence from the stores of the ocean. But what is our exact knowledge respecting their food? What were the chemical constituents of the fish tribes they are supposed to have subsisted on?—did they abound or not in oleaginous or fatty matter? It is to be borne in mind, that even in the animal kingdom there is a vast amount of hydro-carbonaceous matter, in the form of fat, oil, spermaceti, &c., which, when reduced to its constituent elements, of which hydrogen is one, may, in certain circumstances or conditions, be productive of ammonia; in others of water. Thus, if fat or oil be burned in a lamp or candle, the products of combustion are carbonic acid and water, the carbon and hydrogen uniting with the oxygen of the atmosphere. It is important to observe, however, that hydrogen unites with oxygen only at the temperature of ignition. But the result is different when fat or oleaginous matter is decomposed in the body of an animal. In this case, the carbon is taken into the sanguiferous system, and is carried to the lungs, where it unites with the oxygen of the atmosphere, and forms carbonic acid, producing animal heat, which is its designed object. But the hydrogen having no part to perform in the functions of the animal system, is ejected with the excreta, and, meeting with the nitrogen of the atmosphere, is converted into ammonia. If the food then of those sea-birds abounded in oleaginous or hydro-carbonaceous matter, the difficulty of accounting for a large proportion of ammonia in their excreta ceases; and whatever successive assimilations such hydro-carbonaceous matter may have undergone in the bodies of a class of animated beings (fishes) whose existence is maintained by preying on each other, still it must primarily have been derived from vegetable matter, as the food of some living creatures, which in their turn become the food of others.

The bearing of all these considerations tends, I conceive, to the conclusion that ammonia is of vegetable origin, that is, derived from an element inherent in vegetable matter, that element being hydrogen; and this brings me back to the proposition I set out with, that the primary use and purpose of ammonia in vegetable economy is to supply hydrogen for the formation of vegetable substance; at the same time furnishing whatever nitrogen is found under any form or combination in vegetable productions. *J. H. H.*

Home Correspondence.

Land Agents.—With your permission I again take leave to offer a few remarks in connection with this subject, and, however feebly my observations may be felt, I feel deeply convinced that the progress of agricultural improvement hereafter, as well as its sluggishness hitherto, may be mainly attributed to land agents as a body being extremely inefficient. Your numerous readers in different parts of the kingdom may easily discover whenever a vacancy occurs in the management of a gentleman's estate, that in four out of five cases the individual selected to supply the void has generally never had any previous connection with the duties he is now for the first time appointed to perform. Knowing a good deal of the agriculture of different counties, as well as some of the largest estates in the different localities, the facts bear me out in making this statement; and, of my own knowledge, I can aver that during the past year vacancies occurred upon the estates of two large and wealthy landowners in the same county, when, as a matter of course, numerous applicants presented themselves; each post had many appendages to make them coveted, and were the best of this description of employment. Two or three of the applicants were gentlemen who had served their articles with land agents, and had otherwise qualified themselves, but who being unsupported by any direct influence in the necessary quarter were unsuccessful, and those who were appointed were in no way whatever capable of fulfilling the duties they undertook. Neither of them had before any knowledge beyond their own particular localities, nor had either of them any previous experience in the management of agricultural property. The estates in each of these cases were as large, if not the greatest, in the particular county; and if those possessed of large property adopt this plan of proceeding in selecting parties to manage their affairs, it follows as a natural consequence that the more ignorance prevails on the part of an agent, that it will eventually turn to on the part of an agent, that it will eventually turn to his advantage. Independently of this, it deters many from incurring expenses in pursuit of the requisite knowledge, seeing that it carries no recommendation. How is it possible under these circumstances that agriculture can keep pace with other branches of knowledge; and why should it be urged upon tenant farmers that they must keep up with the times, when a landlord thinks their superintendent is best suited to his employment, when he is in profound ignorance of the duties he has appointed him to perform? Are improved methods likely to be introduced to the notice of agriculturists through such channels as these? or are suggestions emanating from such a source likely to command the attention of the tenantry? Should sound and practical advice be given by a person occupying the position of such an agent, it will always be received with doubt, on the ground of his previous want of skill disqualifying him from being a competent judge. The old plan which has attached to this species of management has been on the first difficulties presenting themselves, either by low prices or otherwise, to give an indiscriminate reduction by way of so much per cent.; and if an improper and undue weight of arrear has accumulated against any one or more tenants, then to sweep it away, without any just reason, leaving the man who keeps his payments regularly without any reward whatever. A certain quantity of newspaper praise is bespattered upon a landowner, without his having any one to advise him whether he be doing an act of justice or injustice; and in the majority of those who return a per centage, the farms are more highly charged than those who give none at all; and if a maximum reduction of 20 per cent. were returned, the chances are an owner of such an estate would not then be on a level with the man who always lets his land on reasonable terms. If buildings have to be constructed, an ignorant agent resorts for assistance to a neighbouring architect or builder; if a farm has to be valued, to some practising land valuer; if drains are to be laid down, to a drainage company or their engineer; if an ordinary agreement has to be entered into, then to his principal's attorney; or if any correspondence arises with a person of superior standing, this part of the duty is also handed over to the lawyer. Do any of your readers imagine that all this machinery brought to bear upon a great majority of the estates in the kingdom opposes no obstructions to progressive advancement? Talk of simplifying titles, when every estate owner may correct such anomalies as these himself. When decisions are sought to be obtained and so many people to be consulted, it is obvious much delay must necessarily arise, and work prejudicially to the best interests of an estate; but if one man held the power in his hands, with a competent judgment to decide the whole, things would be very different. Should these mixed duties engender a bad feeling between the agent and attorney, it produces a clashing of duties, jealousy and obstruction by first one, then the other, which must prove detrimental to the property. This eventually divides the confidence of the principal, and destroys the efficacy and confidence requisite to consolidate the efficacy of one man; responsibility becomes divided, and is constantly removed from one quarter to another. *B.*

Covered Rick Houses.—I once saw what was called a Dutch barn; it was as it were a very tall cart-house, raised on a dozen Oak trees, six on each side, about 12 feet high, open all round, with a common thatched roof; in each post say 10 feet of timber, at 2*s.* a foot = 1*l.* each. The trees were fixed in the ground, wide enough to admit a loaded waggon; first one bay was filled, and so on till the whole building was occupied. This may be a useful erection in wet weather, and would always save the expense of new thatch, and that at a time when a thatcher can hardly be procured; but it occurred to me at the time, and I still think there are several disadvantages; it ought to be placed in a sheltered spot, or when empty the wind would have great power to push it out of the perpendicular, or even to blow the roof off bodily; then it would not be convenient to fill it to the roof, which would be a harbour for all the sparrows in the neighbourhood; and, on my making this remark to the proprietor, he said "no complaint had ever been made on that score," whereupon I clapped my hands, when lo! out flew about a score of pigeons! "Hem!" said I. "Oh, they are my pigeons," said he. "Fortunate birds," said I; "nice and fat, no doubt; but do they leave no dirt behind?" *Delta.*

Education of the Working Classes.—To recur frequently to the same subject may seem tedious to those who merely look at the surface of things. When suggestions come from an anonymous writer, little attention is paid to hints thus appearing, though they may contain a certain amount of common sense worth consideration, as bearing upon the welfare of mankind. If a man who has really the wish to benefit his fellow creatures was deterred from pressing his observations on the notice of the public, because they did not receive the praise which, in his vanity, he considered they deserved, he would be giving way to a silly feeling, and probably lose the pleasure of seeing, in the course of time, some more able and influential member of society carry out his wishes. The over-education of children, like over-feeding pigs, is a faulty system. The former is beginning to be felt, and the latter will soon cease to be even an amusement. At present the interest of the biped properly takes precedence of that of the quadruped. It is to be hoped the meeting lately held at Winchester will meet with the attention it deserves, on which occasion Lord Ashburton so ably introduced the "education of the working classes," dwelling upon the mistake usually made of neglecting essentials because they are "small things," in favour of matters of no use to the labourer and mechanic in comparison with their daily comfort. Enthusiasm carries away well-intentioned persons, whose thoughts run upon reading and the higher branches of education, as if the scholar was to carry everything before him; speaking with all due respect for such individuals, and not meaning in any way to disparage learning, yet it must be admitted that no men are so unfit to rough it in the world. If it be so in one case, why should the fact alter when applied to men who have to earn their bread by strength of arm, economise their means, and understand how to accomplish this end? The use of the globes, the longitude of Timbuctoo, learnt like a parrot, will teach neither boy nor girl in after life to mend a rent in a coat, or make a flannel petticoat, both accomplishments being exceedingly useful in practice during a long winter evening. In all schools for the labouring population, reading, writing, and the common rules of arithmetic are necessary, in order that all members of society, in whatever grade they may be, should have an opportunity of advancing themselves in after life. However, it must be always borne in mind, that the Christian religion is the only sure foundation on which to build good conduct and contentment; though leading journals would leave this to Nature or chance, yet we may rest assured all must fail without a faithful knowledge of Him to whom we owe everything. The injudicious distribution of tracts is doing incalculable mischief, many of them from their puerile phraseology tending to excite the ridicule of those for whose instruction they are written. It should be recollected that many of the uneducated are strong-minded prejudiced men, requiring a very different kind of evidence to convince them of error, than what is contained in silly anecdotes and weak verbiage. The practical system of "house to house visitation," to enable the seed sown in youth to produce fruit in advancing age, is worth all the tracts ever printed. How true it is, you may lead where you cannot drive! In a large straggling parish, served by one unfortunate half-starved curate, who besides vamping up his sermons has other duties to perform, it is next to impossible, even if he was a Hercules in strength, to call upon and converse with his poorer neighbours, so as to have any influence over them. Hence ignorance and crude ideas flourish, where knowledge should vegetate. If a man wishes to become a gardener, he must know how to prepare his land before he sows his seeds. An agriculturist cannot expect his farm to yield crops spontaneously; to attain his object he must use the plough, harrows, &c. &c. A youth cannot run before he is able to walk. Instead of cramming parish children with the higher branches of education, it would be better after they are grounded in the rudimental parts to instruct them in domestic duties and economy in all its uses. Saving pence, making and mending clothes, are preferable to idleness at home or drinking in a beer-shop; a nail put in here, a brick there, a bit of mortar or a slate in another place, will save much wretchedness and ill-health, and preserve the cottage from the keen winter blasts, frost, and snow. This is a long story, but long as it is, if nobody else considers the subject worth notice, the same unworthy pen may be induced to spoil a sheet or two more of note paper. *Falcon.*

Societies.

Cirencester.—*Report of the Judges for the Draining Premium offered by the Hon. C. F. Ponsonby.*—There were three competitors for this prize:—The Right Hon. Lord de Mauley, the Hon. C. F. Ponsonby, and Mr. W. J. Sadler, of Bentham, near Purton. Lord de Mauley's field, on Town's-end Farm, is arable, and was very wet previously to draining. It lies in lands of various widths, but in a good form for draining. The soil is a good clay loam, intermixed with stones. The subsoil is a strong clay, with layers of thin stones, and in some places a hard solid rock. It is on the forest marble formation. The drains are put in the furrows 4 feet deep, except in two or three flat furrows, where they are a few inches less. The main drain is walled, and covered with flat stones, and of ample dimensions. The furrows are tile drained, and the whole filled up with small stones to within 16 or 18 inches of the surface, besides having an extra heap at each junction with the main; the width of drain necessary for the men to use the pick and sledge hammer in digging them, will account for the quantity of stones used. On 10 acres there are 899 perches of drains, which will make the average distance about 30 feet apart. The cost of digging is as follows:—

145 perches at 2*s*	...	...	...	...	..	£14	10*s.*	0*d.*
142 " at 1*s.*	...	...	...	...	...	7	2	0
130 " at 11*d.*	...	...	...	...	...	5	19	0
237 " at 10*d.*	...	...	...	...	...	9	17	6
245 " at 9*d.*	...	...	...	...	...	9	3	8
899						£46	12	2

The stones, hauling, and filling the drains, cost as under:

Digging 356 loads of stones, at 5½*d.*	...	...	£8 3*s.* 2*d.*
Hauling 416 loads of stones, 79 days, at 5*s.*	...	...	19 15 0
Filling ditto, 44 days, at 20*d.*	...	...	3 13 4
Filling drains with stones 899 perch, at 1½*d.*	...	...	5 12 4½
			£37 3 10½

Making a total cost of 83*l.* 16*s.*, or 8*l.* 7*s.* 7*d.* per acre.

The Hon. C. F. Ponsonby's field, situate on the Dean Farm, is also arable, and lies partly in wide flat lands of

irregular widths. It is somewhat a difficult piece to drain effectually, having a fall in two directions. In one direction from west to east, which is the way the furrows run, and in which the drains are mostly put; and also a considerable slope to the south. Part of the piece drained is a nasty clay soil, having a subsoil of the same formation as Lord de Mauley's 10 acres, but not so good in quality, and a portion is a stone brash intermixed with clay, with the great oolite for the subsoil. The drains are chiefly in the furrows, and are from 26 to 36 inches deep, placed at very irregular widths, varying from 18 to 48 feet apart. The main drain is walled; the drains in the furrows are tile drains, with small stones at top. In the account given us the total number of perches is stated to be 600, which will give the average distance just 44 feet apart. The drains were cut at 7*d.* per perch, amounting to 17*l.* 10*s.* The men are stated to have earned 2*s.* per day on the average. The stones, hauling, and filling the drains, cost as follows :—

	£.	s.	d.
Hauling 300 loads of stone, one horse and one boy, at 3*s.*	4	10	0
Quarrying and filling stones	2	5	0
Placing stones in drains, at 1*d.* per perch ...	2	10	0
Four-fifths of the stones were collected from other lands drained by Government Loan, and cost nothing	0	0	0
	9	5	0
Digging drains	17	10	0
	26	15	0

Making a total cost of 26*l.* 15*s.*, or 2*l.* 13*s.* 6*d.* per acre.

Mr. Sadler's is pasture land, lying in low lands of rather irregular widths, with very little fall. In one furrow we had an opportunity of seeing the fall by the water lying in it before draining; it was 4 inches only in a distance of 7 chains. The soil is partly a sandy loam, and the remainder a very stiff clay, geologically termed the Oxford clay, but not of the worst description, like the neighbouring district of Braydon. The drains are put up the furrows from 23 to 39 inches deep, a few only of the shallowest depth, where the land is very flat; beside the furrow drains there are several skew drains on the clayey side of the field running under the furrow drains, but not connected with them. Pipes are used in draining this field with a few broken stones on them, about a chain up the furrows from the main. The main drain is laid within pipes, and has three deep wells or settling pits in it, to prevent the sediment stopping up the pipes. The cost was as follows, as near as we can estimate it from the plans, Mr. Sadler not having furnished us with the number of perches nor the quantities of the different sized pipes :

	£	s.	d.
Cost of stones	0	16	0
Hauling ditto and pipes	2	6	0
About 1250 perch draining, at 2¾*d.* ...	14	6	5
Pipes	18	14	11
Total	£36	3	4

The object in offering a prize for the best draining, we take it, was to compare the different modes adopted in the neighbourhood, and if there were one or more better than the others to bring it or them more prominently before the public for their benefit; and on the other hand, if there were any bad systems either from injudicious arrangement, or more expensive in their construction than is necessary, to expose them as a warning. According to our opinion the Society has only succeeded in the present instance in the latter; for we do not consider either of the competitors worthy of the prize, although there are some good points in two of them. To begin with Lord de Mauley's, the arrangement is good in putting the drains in the furrows; there is a good outlet for the main to empty itself; the work is executed well, and according to the quantity, with economy; but to dig large 4-feet drains, and fill them with stones up to within 16 or 18 inches of the surface, is much too expensive, for besides the 416 loads of stones brought from a distance of over half a mile, there was a great quantity dug out of the drains, so that in reality the quantity of stones is much greater than those carted. We have no hesitation in saying, had 3 feet drains been dug, and 15 inches of stones put in the same way, and the land kept in its present form, it would have answered every purpose at little more than half the cost. On the Hon. Mr. Ponsonby's, the arrangement of the drains is bad, in consequence, in some measure, of keeping the drains in the furrows, as they are very shallow, and ought not in this case to have been regarded; we have before said it is a somewhat difficult piece to drain. From its being sidelong, it requires the drains deeper and nearer together than leveller land: it is a piece where a little geological knowledge would be of service, for there is no doubt but drains have been put where they were unnecessary, if the water from the wet land above had been properly cut off, or sunk in the hollow rock below; besides, where the land is wettest on the clay the drains are farthest apart, as much as 48 feet in some instances, so that it is far from being effectually drained, in fact there is not one point in this case we can commend.

There are some good points in Mr. Sadler's draining; the putting the drains in the furrow is right, although on a portion they are rather closer than necessary, and had he stopped at the furrows he would have been a richer man in more ways than one, as we consider he has spent 5*l.* in the skew drains to no good purpose whatever. As regards the workmanship it is well and economically done in every respect; and the dead wells are to be commended, especially on sandy land, where the drains are apt to silt up. We could have wished that Mr. Sadler had been able to get a better outlet for his main drain, as when we inspected it after the late heavy rains, the mouth of it was some 12 or 15 inches under water. We mention this just to draw the attention of Mr. Sadler, and others suffering from the cause, to a remedy which can be put in force by the magistrates at petty sessions, who have the power to compel the proper cleansing and deepening of watercourses, under Lord Lincoln's Act; and we have little doubt if Mr. Sadler were to follow the watercourse, he would find various little obstructions, which are generally thought of no consequence, but are in reality sufficient to make a great difference in the height of water in a flat country.

THOMAS ARKELL.
EDMUND RUCK.

Reviews.

The Journal of the Royal Agricultural Society of England. Vol. XIV. Part II. John Murray, London.

THE current Part of the Society's Journal is one of the most instructive and useful that has yet been issued. It is really astonishing to all but those who are fully acquainted with the extent and wealth of the territory within agricultural jurisdiction, to find, year after year, for so long a period, these large volumes issuing in unabated freshness and instructiveness. Not only the standard topics of the profession continue to furnish the subjects of useful and most readable communications, but those of more immediate interest, and which are attracting especial notice for the time, receive the attention which the intelligent reader would desire, but which in an annual periodical he could hardly expect, unless it were under the guidance of equal tact and ability to that which Mr. Pusey has displayed.

In the number before us we find notices of the refuse of cod-fishery as manure, and of nitrate of soda as a substitute for guano—both of them admirably timed to the present condition of the guano market—and both of them likely to remain useful when the present pressure there may have passed away. Of course, the reports of the Gloucester meeting, and several county reports of English and Scottish Agriculture, occupy the bulk of the volume; Mr. Stevenson's paper on the farming of East Lothian is especially valuable—the statistical information collected by the Highland Society being already made use of in the exactness and certainty with which all the principal agricultural features of the county are given. In addition to these, and as the principal feature of the volume, we have one of those extraordinary contributions to our knowledge of agricultural chemistry for which, during several years, we have had to thank Mr. Lawes, of Rothamsted. A mass of well-arranged facts, arrived at by well-devised and extensive experiments, are admirably discussed, and inferences are drawn which bear directly on the economy and practice of feeding. This paper and many of the others require closer study than we have yet been able to give them; we must be satisfied at present with this general statement of the contents of the volume, but to many of the communications which it contains we shall hereafter direct the more particular attention of our readers.

Cuthill's Belgian Prize Essay on the Potato, &c. &c. J. Cuthill, Camberwell.—This is the third edition of a pamphlet that has already been referred to more than once in our columns, as describing the method of Potato culture most likely to attain success in the present state of the plant. It contains also information on the cultivation of other garden vegetables.

Poultry.

Cochin China Fowls.—The gentleman who heads his article in your last week's Number "Right or Wrong," is, in my opinion, decidedly wrong when he says Cochin China fowls are not good eating. I have kept them some little time, and all I have ever killed, when eaten, have been pronounced by first-rate cooks, and well-known and acknowledged good judges of eating, excellent. If not properly fattened, and dressed by an ignorant second-rate cook, of course they are bad. *An Admirer of Cochin China Fowls.*

POULTRY: *C.P.* I have no ceiling to any of my poultry houses; they are plainly tiled with a layer of straw beneath the tiles. The perches are 5 feet below the roof; I do not line them at all, and my birds are always healthy. If you have a ceiling, the best is the ordinary one, such as you would put in a dwelling, but of a rougher description. It should be 2 feet below the roof, and have apertures to allow the foul air to escape into the roof, and be there carried off by a current of air which you must provide by openings at the extremities. My impression is, it looks comfortable but is unnecessary. First-class young turkeys at Christmas weigh from 16 to 24 lbs.—*Durham.* I am not learned in pigeons, and do not know the "Arabian."—*Nine Years' Subscriber.* Keep your pheasants dry; let them have a shed under which they can shelter themselves; supply it with a perch 3 feet from the ground, and let it be the highest spot in the mew. The bottom should be fine dry gravel. Feed on the best Barley, changing sometimes for Wheat, with now and then a little Hempseed. They are fond of bread, and it keeps them tame if they are fed by hand at times. Let them always have clean water.—*J S.* Eight lbs. for the cock, and 6½ lbs. for the hen will be fair weights, but not large.—*Oronoco Goose.* We know nothing of the Oronoco goose. *John Baily*, 113, *Mount Street.*

Notices to Correspondents.

INDIAN CORN: *W A* asks how "mush," so strongly recommended by Mr. Lort at p. 810 last year, is made. Dealers in Indian meal would do well to advertise: we cannot do it for them.

PRICES: *An Old Subscriber.* The *yearly* averages were named. The figures were taken, we think, from Mr. Willichs's table.

QUALITY THE TEST OF CHEAPNESS.

BERDOE'S OVERCOATS AND CAPES resist any amount of rain. One of the largest Stocks in London of Superior GARMENTS at Lowest Charges. First-Class DRESS COATS, 3*l.*; BOY'S SUIT, 11*d.* per inch, according to height.—96, New Bond Street, and 69, Cornhill. (Nowhere else.)

MECHI'S, 4, LEADENHALL STREET, LONDON.—A visit to the SHOW ROOMS of this well-known emporium will afford an agreeable occupation for an hour or two. They will be found to contain the most superb specimens of Papier Maché produced in this country. MECHI has also a world-wide reputation for Bagatelle Tables, Dressing Cases, Work-boxes, Work-tables, Desks, Table and all other descriptions of Cutlery, everything for the Toilet and Work-table, and an infinity of other articles.

N.B.—The renowned Magic Strop, Paste, and Razors.

FENDERS, STOVES, AND FIRE-IRONS.—Buyers of the above are requested, before finally deciding, to visit WILLIAM S. BURTON'S SHOW ROOMS, 39, Oxford Street (corner of Newman Street), Nos. 1 and 2, Newman Street, and Perry's Place. They are the largest in the world, and contain such an assortment of FENDERS, STOVES, RANGES, FIRE-IRONS, and GENERAL IRONMONGERY as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright Stoves, with bronzed ornaments and two sets of bars, 2*l.* 14*s.* to 5*l.* 10*s.*; ditto, with ormolu ornaments and two sets of bars, 2*l.* 10*s.* to 12*l.* 12*s.*; Bronzed Fenders complete, with standards, from 7*s.* to 3*l.*; Steel Fenders from 2*l.* 15*s.* to 6*l.*; ditto, with rich ormolu ornaments, from 2*l.* 15*s.* to 7*l.* 7*s.*; Fire-irons from 1*s.* 9*d.* the set to 4*l.* 4*s.* Sylvester and all other Patent Stoves, with radiating hearth plates. All which he is enabled to sell at these very reduced charges,

1st,—From the frequency and extent of his purchases; and,

2dly,—From those purchases being made exclusively for cash.

WILLIAM S. BURTON has TEN LARGE SHOW ROOMS (all communicating), exclusive of the shop, devoted solely to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated and Japanned Wares), Iron and Brass Bedsteads, so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

No. 39, Oxford Street (corner of Newman Street); Nos. 1 and 2, Newman Street; and 4 and 5, Perry's Place.

METCALFE AND CO'S NEW PATTERN TOOTH BRUSH, PENETRATING HAIR BRUSHES, AND SMYRNA SPONGES.—The Tooth Brush performs the highly-important office of searching thoroughly into the divisions and cleansing in the most extraordinary manner—hairs never come loose. Peculiarly penetrating Hair Brushes, with durable unbleached Russian bristles, which will not soften like common hair, and immense stock of genuine unbleached Smyrna Sponge, with every description of British and Foreign Perfumery, at METCALFE, BINGLEY, & Co.'s only Establishment, 130 B and 131, Oxford Street, second and third doors west from Holles Street.

CAUTION.—Beware of the word "from" Metcalfe's, adopted by some houses. Metcalfe's Alkaline Tooth Powder, 2*s.* per box.

NO CHARGE FOR STAMPING ARMS, CRESTS, INITIALS, &c., on paper and envelopes, at LOCKWOOD'S well-known establishment, 75, New Bond Street. Good cream-laid Note-paper, five quires for 9*d.*; Thick ditto, five quires, 1*s.*; Albert and Queen's sizes, five quires for 6*d.*, 9*d.*, and 1*s.*; Envelopes, 3*d.* to 1*s.* 6*d.* per hundred; Foolscap paper, 7*s.* 6*d.* per ream; Copybooks, 2*s.* 6*d.* per dozen. Card Plate engraved, 2*s.* 6*d.*; 100 Cards printed, 2*s.* 6*d.* Mourning Stationery equally cheap. Wedding Orders promptly executed. A large variety of Writing and Dressing Cases, Envelope Boxes, Blotting Books, Inkstands, Gold Pens, Church Services, &c. Copy address, LOCKWOOD'S, 75, New Bond Street. Country orders for 20*s.* sent carriage free.

KNOW THYSELF!—Professor BLENKINSOP continues to receive from individuals of every rank the most flattering testimonials of his success in describing the CHARACTERS of Persons from their HANDWRITING, pointing out their mental and moral qualities, whether good or bad.—Address by letter, stating age, sex, and profession, inclosing 13 uncut postage stamps, to Dr. BLENKINSOP, 344, Strand, London.

TO NERVOUS SUFFERERS.

A RETIRED CLERGYMAN having been restored to health in a few days, after many years of great nervous suffering, is anxious to make known to others the means of cure. Will, therefore, send (free), on receiving a stamped envelope (properly addressed), a copy of the prescription used.—Direct to the Rev. E. DOUGLAS, 18, Holland Street, Brixton, London.

THE EAST INDIAN ANTI-NERVOUS PILLS, a cure when all other means fail for Nervous Debility, Lowness of Spirits, Loss of Memory, Head-ache, Dimness of Sight, Fear, Blushings, Tremblings, Melancholy Thoughts, Rheumatic Pains in any part of the body, Urinal Diseases, Constitutional Wasting, &c.

Mr. ROBERTS, late Army Surgeon, discovered these Pills during his residence in India, testing their curative powers for years. In his own private practice, in numbers of hopeless cases, never failing to produce ease of body and tranquillity of mind in one or two days, and ultimately effecting a permanent cure.

Price, 1*s.* 1½*d.*, 2*s.* 9*d.*, 4*s.* 6*d.*, 11*s.*, and 33*s.* per box. Sent post free to any part upon receipt of postage stamps or Post-office order for the amount. Address J. ROBERTS, Surgeon, Hall Square, Yarmouth, Norfolk. Advice and Medicine for every form of disease sent to any part.

PAINS IN THE BACK, GRAVEL, LUMBAGO, RHEUMATISM, GOUT, INDIGESTION, FLATULENCY, NERVOUSNESS, DEBILITY, &c.

DR. DE ROOS' COMPOUND RENAL PILLS, as their name Renal (or the Kidneys) indicates, are a most safe and efficacious remedy for the above dangerous complaints. For depression of spirits, incapacity for society, study, or business, giddiness, drowsiness, nervousness, and insanity itself, when arising from or combined with urinary diseases, they are unequalled. Price 1*s.* 1½*d.*, 2*s.* 9*d.*, 4*s.* 6*d.*, 11*s.*, and 33*s.* per Box, through all Medicine Vendors, or sent (free) on receipt of the amount in postage stamps, by Dr. DE ROOS, 35, Ely Place, Holborn, London. At Home for consultation daily from 11 till 1, and 5 till 8, Sunday excepted. Advice and Medicines, 1*l.*

PARR'S LIFE PILLS are now, from their many virtues, the established Family Medicine throughout the British Empire. PARR'S LIFE PILLS will be found speedily to reanimate the spirits, improve the digestive powers, and restore the whole nervous system to a happy and natural state; the balsamic powers of this medicine produce that delightful feeling of good spirits so very desirable, and disposes both mind and body to healthy exercise—everything under its influence soon wears a joyous aspect, and the varied duties of life are performed with pleasure; and, instead of long and weary nights, gives sound and refreshing sleep. If the stomach and bowels require it, PARR'S LIFE PILLS act as the mildest and most agreeable purgative, and by their cleansing powers totally eradicate a redundancy of bile.—Sold by E. EDWARDS, 67, St. Paul's Churchyard; BARCLAY and SONS, Farringdon Street; SUTTON and Co., Bow Church-yard; HANNAY and Co., and SANGER, Oxford Street, London; and by all respectable Chemists and Medicine Vendors in Town and Country. In boxes, price 1*s.* 1½*d.*, 2*s.* 9*d.*; and in Family Packets, 11*s.* each.—*** None are genuine without the English Government stamp fixed round the sides of each box.

PRIZE MEDAL—1851.
AT A VERY ECONOMICAL RATE.

SAMUEL CUNDY, MASON and BUILDER, PIMLICO MARBLE and STONE WORKS, Belgrave Wharf, Lower Belgrave Place, Pimlico, London.

Marble Chimney-pieces manufactured by improved machinery. The public are invited to view the stock, unequalled for quality and price. A good Marble Chimney-piece for 40s. Marble Work in all its branches at a remarkably cheap rate for Halls, Dairies, Larders, &c. Circulars sent on application.

N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1s. 6d. per yard run, of E. T. ARCHER, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey.

PROTOXIDE ANTI-CORROSION PAINT, at a very considerable reduction of price. This article is extensively used by the principal Railway and Gas Companies, and by Builders and others for painting Stucco. It prevents iron from rusting, wood from decay, masonry from damp, and the hottest sun has no effect upon it.—Manufactured by CHARLES FRANCIS and SONS, Cement Works, Nine Elms, London.

FIRE ANNIHILATOR, OR VAPOUR FIRE ENGINE.—Its practical value proved incontestably by 23 remarkable cases of successful use. See "Bradshaw" of this month, p. 132. Engines for Dwelling-houses, 3l. to 4l.—Office of the Fire Annihilator Company, 105, Leadenhall Street, London.

THE COTTAGER'S STOVE.—An economical, compact, and portable COOKING APPARATUS, combining a good sized Oven and Hotplate; may be had with or without a boiler, and will cook sufficient for a dozen persons with the consumption of 1 lb. of coal or coke per hour. It requires no fixing, may be placed in any apartment, and is a great security against accidents from fire. It will burn Coal, Coke, or Wood. They are also specially adapted for Emigrants, and may be seen in operation daily, at the Manufacturers', D. & E. BAILEY, 272, High Holborn, London.—Price 50s., and upwards.

GREAT SAVING OF TIME AND MONEY.

R. RESTELL'S PATENT ECONOMICAL GAS APPARATUS for Forcing Houses, Greenhouses, Conservatories, Pits, Shops, Counting Houses, Warehouses, Drying Rooms, &c. &c., possessing all the advantages of Hot Water at half the expense of fitting, and most trifling cost for Gas, far surpassing any ordinary Gas Stove, requiring no furnace, and allowing of no fumes or evaporation in the Building, or possibility of accidents from negligence or carelessness. It has been tested through the late severe weather, on a variety of Plants, and found most satisfactory. It is very quickly fitted up and requires no night attention.—Apply to the Inventor and Patentee, R. RESTELL, 35, High Street, Croydon, Surrey.

Persons wishing to have Houses fitted will please to send the height and dimensions.

WANTED IMMEDIATELY, the Address of every Gardener or his Employer wishing to have (free by post) Patterns, with prices and particulars, of HAYTHORN'S HEXAGON GARDEN NET, patronised by the Nobility, Clergy, Gentry, and all the principal Gardeners. The best and cheapest article for the protection of bloom, fruit, and flowers from frosts, birds, wasps, flies, children, and servants; and also for covering Hothouses.—Letters and orders to be directed to J. W. HAYTHORN, Nottingham. Parcels, carriage paid to London, Liverpool, Leeds, Bristol, Hull, &c.

HORTICULTURAL BUILDINGS, ROCK AND RUSTIC WORK, ORNAMENTAL WATER, FOUNTAINS AND FALLS, AND LANDSCAPE GARDENING, executed on the best principles; Estates Improved, Land Laid Out for Building, &c., by Mr. GLENNY, Valuer, Estate and Horticultural Agent, 420, Strand.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

EDWARD AND A. WEEKS (late with J. WEEKS & Co.), Park Cottage, King's Road, Chelsea, are now in a position to execute any of the above works, in the very best manner, and at a reduced price. Materials and workmanship warranted best quality. Plans and estimates forwarded on application for all kinds of Horticultural Erections, also for the Heating of Churches, Hospitals, Halls, Offices, &c.

One, two, and three-light Boxes always on hand.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.

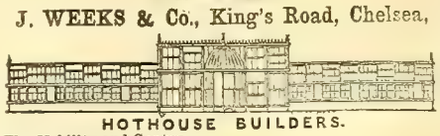
GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

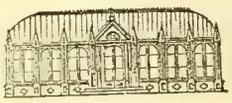
HORTICULTURE IN ALL ITS BRANCHES.

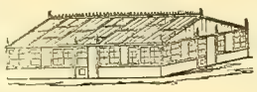
J. WEEKS & Co., King's Road, Chelsea,

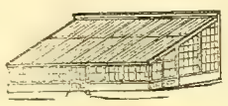


HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.





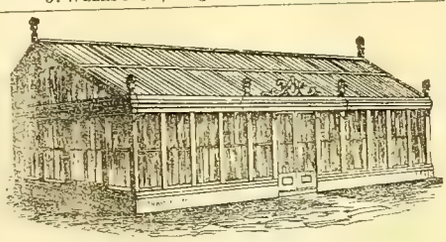


The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.



HOTHOUSES, CONSERVATORIES, &c., made and fixed complete, at a considerable reduction. CUCUMBER and MELON BOXES and LIGHTS of all sizes, made of the best materials, glazed and painted complete, kept ready for immediate use, packed and sent to all parts of the kingdom. Reference may be had to the nobility, gentry, and the trade in most of the counties in England.—JAMES WATTS, Hothouse Builder, Claremont Place, Old Kent Road, London.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

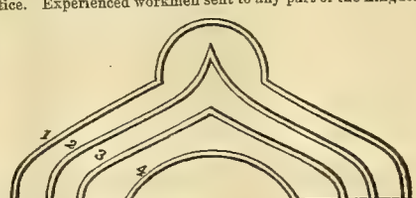
E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1s. 3d. per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8d. per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

METAL CONSERVATORIES, PLAIN OR ORNAMENTAL, ERECTED TO ANY DESIGN.

THOS. WALLER AND CO. (many years Foreman to Messrs. Deane, Dray, & Deane, Finsbury Iron Works, and London Bridge), Iron Founders, House and Ship Smiths, Gas Fitters, and Manufacturers of all kinds of Metal Conservatories, Greenhouses, Verandahs, Balconies, Summer-houses; Hot, Cold, Shower, and Fumigating Baths; Public and Private Buildings. Greenhouse Conservatories heated by hot water or the Patent Drying Apparatus. Every description of open and close Kitchen Ranges for large or small establishments. The Trade supplied with Metal and Iron Sash Bars for Conservatories and Greenhouses, bent to these or any other design on the shortest notice. Experienced workmen sent to any part of the kingdom.



Office, 47, Fish Street Hill, London.

Ratcliff Iron Works, 12 and 13, Rose Road, Ratcliff, near Stepney Railway Station.

ESTABLISHED ABOVE SIXTY YEARS.

ROBERT METTAM, BRITISH and FOREIGN WHOLESALE WINDOW GLASS WAREHOUSE, 30, Princes-street, Leicester-square.

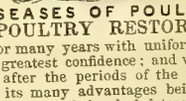
Warehouse, 87, Bishopsgate Street Without—same side as Eastern Counties Railway.

PURVEYORS OF LIVE BIRDS
(BY SPECIAL APPOINTMENT)

TO HER MAJESTY AND H.R.H. PRINCE ALBERT.



DISEASES OF POULTRY.

BAKER'S POULTRY RESTORATIVE, having been used for many years with uniform success, is recommended with the greatest confidence; and will be found invaluable during and after the periods of the various Exhibitions. Not least among its many advantages being the easy manner in which, in its liquid form, it is administered, and thus obviating the troublesome necessity of handling the birds. Great economy will result from the use of the RESTORATIVE in the improved condition and well-doing of Poultry, in testimony whereof an inspection of the extensive and choice Collection at the Pheasantry is invited.

"It cannot but be extensively brought into use."—*The Field*, *Jan. 7*, 1854.

Price, with full Directions for Roup, &c., 2*s.* 6*d.*, either in Liquid or in Pills. May be obtained through any respectable Chemist.

BAKER'S REGISTERED POULTRY, PHEASANT, AND PIGEON FOUNTAIN is gradually and surely supplanting all others, being found the most simple, useful, and economical.

"We have seen the Fountains; they look well, and cannot fail to answer. Being well made of strong metal, are durable and cheap."—*Gardeners' Chronicle*, *Feb.* 12, 1853.

"The article is both neat in appearance and durable, and will no doubt meet with a great sale; it deserves it."—*The Field*, *March* 19, 1853.

Price—4 quarts, 6*s.* 6*d.*; 9 quarts, 8*s.* 6*d.* Drawings by post.

S. C. & C. N. BAKER, City, and the Pheasantry, Chelsea.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

BAILY'S ROUP AND CONDITION PILLS FOR POULTRY.—This remedy has been extensively tried with uniform success, and is offered to amateurs and the public with the greatest confidence. It will effectually overcome that disease which has hitherto been the bane of the poultry-yard, and destroy that apprehension known to all poultry keepers, when a favourite and valuable fowl is seen to droop. It is inestimable for poultry returning from exhibitions, and greatly facilitates moulting.—Sold, with full instructions for use, in boxes containing 50 pills, by JOHN BAILY, 113, Mount Street, Grosvenor Square, price 3*s.* per box, or by post 3*s.* 4*d.* "Fowls, by Baily," the most useful and plainest treatise of the day; price 2*s.*, by post 2*s.* 6*d.*

Baily's Registered Fountains, universally adopted and approved. Drawings and particulars, by post, on application.—113, Mount Street, Grosvenor Square.

NEW ZEALAND.

FRED. YOUNG AND CO.'S LINE.—To follow the BATUNGUITH, and to Sail punctually on Feb. 25, embarking passengers at Gravesend, for WELLINGTON, CANTERBURY, and AUCKLAND, the NORMAN MORRISON, A 1 12 years, 1000 tons, with a full poop, G. F. S. MAUNDRILL, Commander, loading in the East India Docks.—For freight, passage, &c., apply to FRED. YOUNG, and Co., 9, Adelphi Terrace, Strand; or, 74, Cornhill.

HEAL & SON'S ILLUSTRATED CATALOGUE of BEDSTEADS, sent free by post; it contains designs and prices of upwards of 100 different Bedsteads, in iron, brass, japanned wood, polished birch, mahogany, rosewood, and walnut tree woods; also of every description of bedding, blankets, and quilts.—HEAL & SON, Bedstead and Bedding Manufacturers, 196, Tottenham Court Road.

GLENNY'S BALBRIGGAN HOUSE, 33, Lombard Street, City, is the only Establishment in London where the GENUINE BALBRIGGAN STOCKINGS can be purchased in every quality and size, for ladies, gentlemen, and children.

N.B. The Imitation Stockings are not made at Balbriggan.

On the 1st of January was published, the first Number for 1854 of

THE

FLORIST, FRUITIST, AND GARDEN MISCELLANY.

A MONTHLY ILLUSTRATED PERIODICAL,

Devoted to Floriculture, Horticulture, and General Gardening Information.

By CHARLES TURNER AND JOHN SPENCER,

ASSISTED BY THE BEST PRACTICAL WRITERS OF THE DAY.

Price One Shilling.

This work is now permanently enlarged to 32 pages, consisting of Original Papers on the most popular subjects, Notices of New Plants, and Inventions, Reviews, &c.

The February Number will contain two Coloured Illustrations and seven Woodcuts. Those who are not already Subscribers should order promptly, as a New Volume was commenced with the January Number.

LONDON: CHAPMAN AND HALL, 193, PICCADILLY;
J. MENZIES, EDINBURGH; J. M'GLASHAN, DUBLIN. SOLD BY ALL BOOKSELLERS AND SEEDSMEN.

RENDLE'S PRICE CURRENT AND GARDEN DIRECTORY.

The following is from JOHN EDWARDS, Esq., F.H.S., *Hon. Secretary of the National Floricultural Society, and Editor of the "National Garden Almanack," &c.:—*

Wace Cottage, Holloway, Jan. 6, 1854.

GENTLEMEN,—The reputation acquired by your "Price Current" for 1851 is amply sustained by that for the present year just issued. I can but congratulate you on the tone adopted, by which you so fairly meet the objection to long lists of names; your policy is just. However needful the reformation, such should scarcely be obtained by violent or revolutionary measures; it will need but a few years of perseverance to convince both vegetable and floricultural *gourmands* that selections and not collections is the true policy. I feel you have nobly done your part to convince purchasers of their erroneous notion, and which, if followed up dispassionately, must ultimately produce the wished-for result. After all, I can but think that in a majority of cases the fault rests with isolated growers. Our modern or fast men would, I should hope, shun to require other than the latest improvements; vendors, of course, risk their reputation, when they offer other than proved sorts, even though they be novelties. I offer the above for your use, if such be of service.

I am, yours truly,
JOHN EDWARDS.

Messrs. W. E. RENDLE & Co., Plymouth.

From CHARLES M'INTOSH, Esq., *the Editor of the "Book of the Garden," the most sterling work on Gardening at present known:—*

Dalkeith Park, Jan. 20, 1854.

DEAR SIR,—I am much obliged to you for your attention in sending me your nicely arranged "Price Current," which is well got up, and must be of much use to your customers and purchasers generally.—With kind regards, I am, dear Sir, yours truly,
CHAS. M'INTOSH.

To Mr. RENDLE.

The following is from DONALD BEATON, Esq., *well known as one of the most popular writers on Horticulture of the day:—*

Kingston, Surrey, Jan. 12, 1854.

DEAR SIR,—I have a copy of Mr. RENDLE'S "Price Current" for this year, and I can tell you at once that it is the most useful Catalogue and Calendar that was ever sent out from any house of business in our line, and I do not see what more you could add to it by way of usefulness. How different from the bare-bone lists to which you and I had access, when we first took to the spade on our own account!—I am, dear Sir, yours truly,
D. BEATON.

To Mr. ERRINGTON.

The PRICE CURRENT *should be obtained by all who have gardens, whether small or large. It can be had through any Bookseller, price 6d.; from the London Publisher's Office, 294, Strand; or from the Proprietors,* WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth.

On January 31, Nos. 57 and 58, price 1s. 6d. each, of the

ORNAMENTAL FLOWER GARDEN AND SHRUBBERY. The cheapest and most beautiful coloured periodical of the day, comprising the works of the first writers, including Professor Don, R. Sweet, &c.; also all of the most recent practical Hints on Culture, Propagation, &c., by the Editor. Published monthly. Each number contains four large and beautifully-coloured engravings. Also, now ready, Vols. I. to III., each containing 72 coloured plates, price 1*l.* 8*s.* per vol. cloth.

G. WILLIS, Great Piazza, Covent Garden, London.

On January 31, Nos. 34 and 35, price 2s. each.

MEYER'S BRITISH BIRDS and their EGGS, COLOURED ILLUSTRATIONS of.—This is the most complete and beautiful work of the kind ever offered to the public. Each number contains four accurately-coloured plates, executed by the Author, with descriptions. Published in monthly numbers. Also now ready, vols. 1 and 2, each containing 60 coloured plates, price 1*l.* 11*s.* 6*d.* each, bound in cloth.

G. WILLIS, Covent Garden, London.

L'ILLUSTRATION HORTICOLE.—Published by A. VERSCHAFFELT, Nurseryman, Ghent, Belgium.

The Illustration Horticole will appear Monthly, and contain each number three Splendid Coloured Plates, of new and rare Plants, with a description of each. The first number is now out, and contains Rhododendron album speciosum, Oncidium Barkeri, Philesia buxifolia.

Price 12s. a year. The first number may be seen at Mr. R. Silberrad's, 5, Harp Lane, Great Tower Street, London; Agent to the Foreign and English Nurserymen.

Now ready, price 21s., with 15 highly finished coloured Plates and numerous Wood Engravings (or with Supplement and four additional plates, 5s. extra),

London: LONGMAN, BROWN, GREEN, & LONGMANS.

Just published, in 8vo, price 14s., cloth,

THE RIFLE AND THE HOUND IN CEYLON. By S. W. BAKER, Esq. With numerous Illustrations printed in Colours, and Engravings on Wood.

"Mr. Baker has a loving relish of the beauties of Nature, a keen eye for the antecedents of wild animals, and the coolness to observe them when face to face in a deadly struggle. He has also graphic powers of no mean order, whether as regards landscape, its living denizens, or the sportsman's actions. Some of his descriptions of scenery and wild creatures may vie with anything Wilson or Audubon could produce."—*Spectator.*

London: LONGMAN, BROWN, GREEN, & LONGMANS.

Just published, in fcap. 8vo, price 3s. 6d. cloth,

THE INVALID'S OWN BOOK: A Collection of Recipes from various Books and various Countries. By the Honourable LADY CUST.

"This little book ought to be in the hands of every housekeeper, and of every young lady who aspires to be a housekeeper, in the British Empire."—*British Banner.*

London: LONGMAN, BROWN, GREEN, & LONGMANS.

GREAT WESTERN, GREAT NORTHERN, SOUTH-WESTERN, AND SOUTH-EASTERN RAILWAY

SEED ESTABLISHMENT, READING, BERKS,

(Under the distinguished Patronage of the principal Members of the Royal Agricultural Society of England),

FOR SUPPLYING

SUTTON'S HOME-GROWN SEEDS TO ALL PARTS OF THE UNITED KINGDOM.

A SELECT LIST OF SEEDS GROWN AND SOLD BY

JOHN SUTTON AND SONS, SEED GROWERS, READING, BERKS.

HAVING been urgently desired by some of our regular customers to quote PRICES OF THE LEADING KINDS OF AGRICULTURAL SEEDS, that they may send us their orders immediately for the season, while we have a good Stock, we have the pleasure of presenting the following Select List of our Home-Grown Seeds, WITH THEIR PRESENT PRICES;

AND FOR ANY LARGE QUANTITIES WE SHALL BE HAPPY TO MAKE A SPECIAL CONTRACT.

AGRICULTURAL SEEDS (CARRIAGE FREE),

WITH PRICES FOR THE MONTH OF FEBRUARY ONLY.

AGRICULTURAL BEET.

	Per lb.—*s.*	*d.*
NEW LARGE CRIMSON; nearly as large as Mangold, contains 50 per cent. more saccharine matter	3	6
WHITE SILESIAN SUGAR, French Seed	1	0

CARROT.

White Belgian Carrot and Mangold Wurzel are necessarily higher than last year, and will probably be dearer as the season advances, but the QUALITY of that we have now to offer is as good as that of any former season.

WHITE BELGIAN, the heaviest cropper and most certain	2	0
ORANGE BELGIAN; more saccharine, and quite as large as the white	2	6
LARGE RED ALTRINGHAM; large and nutritious ...	1	6

MANGOLD WURZEL.

FROM SELECTED ROOTS.

YELLOW GLOBE (or Orange Globe), suitable for any soil	1	4
RED GLOBE, suitable for any soil	1	4
LONG RED; this sort requires good deep soil	1	0
LONG YELLOW; very similar to the preceding in shape	1	4
SUTTON'S ELVETHAM LONG RED; this is a very superior new variety. Every year the demand for Seed of this sorts increases; but, owing to the unfavourable season, we have not been able to save nearly so much as we calculated upon, and we cannot procure this sort from other growers	2	6

We take great pains in selecting the best kinds of Mangold Wurzel, and have much pleasure in receiving continually such remarks from our customers as the following:—

From Col. Kingscote, Kingscote Park, Dec. 5, 1853.

"I could not wish for a better crop than I have of the Elvetham Long Red Mangold, it succeeded with me far beyond what I could expect from the light soil in which it was planted; the crop was a very heavy and even one, and far superior to either my Yellow or Red Globe."

From J. C. Sleman, Esq., West Cliff Cottage, Bideford, Dec 3, 1853.

"I have had a most excellent crop of Mangold Wurzel from the Seed I had of you last April. Whereas the roots in general have been very small in our neighbourhood, I have had the Elvetham weighing 31 and 32 lbs., and Yellow Globe upwards of 25 lbs. each; I shall require a considerable quantity of each sort the ensuing season."

Mangold Wurzel Seed may be had cheaper in quantities of a Cwt. and upwards, if ordered immediately, except "The Elvetham."

KOHL RABI.

LARGE GREEN; Turnip-rooted Cabbage	2*s.* 6*d.*
LARGE PURPLE; scarcely so large as the preceding ...	2 6

There are many varieties of Kohl Rabi, varying materially in size. From them we select the above, as most worthy of cultivation.

EARLY WHITE FIELD PEA.

NEW EARLY RACEHORSE—comes off in good time for Globe Turnips, and is a good cropper, price 12*s.* per bushel.

TURNIP SEEDS.

A GALLON OF TURNIP SEED WEIGHS 6½ LBS.

	Bush.	Gall.		Pound	
	s.	*s.*	*d.*	*s.*	*d.*
GREEN-TOPPED YELLOW SWEDE ...	...	6	0	1	0
ASHCROFT SWEDE, very large, hardy, and of quick growth, yellow flesh with reddish top	56	8	0	1	6
SKIRVING'S LIVERPOOL SWEDE ...	48	7	0	1	4
LAING'S SWEDE; fine shape, purple top	48	7	0	1	4
PURPLE-TOPPED YELLOW SWEDE (SUTTON'S fine stock), a heavy cropper, good form, hardy, and stores well	48	7	0	1	4
RIVERS' STUBBLE SWEDE; a large and first-rate sort in every respect, especially for late sowing	...	8	0	1	6
DALE'S HYBRID, green-topped yellow ...	...	6	0	1	0
SUTTON'S PURPLE-TOPPED YELLOW HYBRID, the hardiest, largest, and most nutritious of all hybrid Turnips	...	7	0	1	4
GLOBE, Red, Green, or White	48	7	0	1	4
LINCOLNSHIRE RED GLOBE, a superior variety, presented to us by Philip Pusey, Esq., M.P., being more solid and larger than any other. (See remarks by reporter of *Gardeners' Chronicle*)	...	8	0	1	6
TANKARD; Red, White, or Green ...	48	7	0	1	4
YELLOW TANKARD (or Tankard Swede) an excellent sort	...	8	0	1	6
SUTTON'S EARLY SIX WEEKS, very early and large	...	7	0	1	4
GREEN-TOPPED & PURPLE-TOPPED YELLOW ABERDEEN, each	40	6	0	1	0
ORANGE JELLY, grown from seed received from Mr. Chivas	...	10	6	2	0
SUTTON'S IMPERIAL GREEN GLOBE, *shape of Matson's, but much larger, and quite hardy*	...	7	0	1	4
YORKSHIRE PARAGON; a fine new White Globe Turnip, as solid and nearly as large as Lincolnshire Red. The grower of this says our Lincolnshire Red Globe might be well called the "Red Paragon"	...	7	0	1	4
SUTTON'S GREEN-TOPPED YELLOW HYBRID possesses same good properties as our Purple-topped Hybrid, but is of quicker growth, and more suitable for poor soils	...	7	0	1	4
HARDY GREEN ROUND; a good old sort	40	6	0	1	0
STUBBLE STONE	40	6	0	1	0
SUTTON'S CRUICKSFIELD HYBRID SWEDE; a valuable new Hybrid, between Kohl Rabi and Skirving Swede ...	...	...		5	0

PARSNIPS.

COMMON CATTLE	Per lb.	1*s.* 6*d.*
NEW LARGE GUERNSEY, altogether a superior kind, some of the roots weighing seven pounds each	2	6

COW CABBAGE.

LARGE DRUMHEAD, from fine selected plants	3	0
THOUSAND-HEADED, very productive, tall, branching	2	6
SUTTON'S EARLY CATTLE; this, if planted 18 inches asunder, produces a very heavy crop, and in a short time. (Sow in March and August.)		

CLOVERS.

Common Red (or broad)	Red Suckling (Trifolium minus)
White (or Dutch)	Alsike Clover
Trefoil (or Hop Clover)	True Perennial Red Clover
Trifolium incarnatum	

CLOVERS.—Notwithstanding the scarcity this season, we have succeeded in procuring a fine stock of each of the above kinds of Clovers. We do not ourselves grow Clover Seeds, but these are obtained direct from the growers, and can be warranted genuine unadulterated Seeds; we always prefer sacrificing what little we have left each year, rather than mix it with the new, and if others offered us mixed seed we could easily detect it. Prices of Clovers on application.

RYE-GRASSES

	Per bushel.—*s.*	*d.*
TRUE ITALIAN RYE-GRASS	5	6
DITTO (SUTTON'S IMPROVED) ITALIAN	6	6
DITTO (DICKENSON'S) ITALIAN	6	6
PACEY'S PERENNIAL RYE-GRASS	6	0
ANNUAL RYE-GRASS, or COMMON RAY	3*s.* 6*d.* to 5	0

MISCELLANEOUS.

Per lb.—*s.*	*d.*		
Keen's Forty-day Maize	—	Yarrow, or Millefoil.	
Lucerne (fresh imported)	1 0	Buckwheat,	
Furze, for fence and cover	1 0	Field Parsley, for sheep feed.	
Broom	1 0	Potatoes, choice sorts.	
Dwarf Rape, or Cole ...	0 4	Linseed or Flax, clean English.	
White Mustard	0 4	Ditto, Riga, imported.	
Burnet.—Spurry.—Chicory.		Giant Saintfoin, 12*s.* per bushel.	

"BISHOP'S LAST AND BEST" PEA, FOR DOUBLE CROPPING, between the rows of Mangold, Swedes, &c., 12*s.* per bushel.

QUANTITIES OF SEED REQUIRED TO SOW PER STATUTE ACRE.

The quantity of seed sown per acre varies greatly in different localities, but the following table may be a guide to gentlemen ordering Seeds:—

	Per Acre.		Per Acre.
Swedish Turnips...	3 to 4 lbs.	Lucerne ...	... 16 to 20 lbs.
Other Turnips ...	2 to 3 lbs.	Furze, for feed ...	12 lbs.
Rape	8 to 12 lbs.	Chicory	4 lbs.
Mustard	14 to 21 lbs.	Italian Rye Grass, 2½ bushels.	
Mangold Wurzel	3 to 4 lbs.	Buckwheat ...	3 to 4 pecks.
Carrot	6 to 8 lbs.	Saintfoin, common,	4 bushels.
Parsnip	5 to 6 lbs.	——— giant ...	5 bushels.
Cow Cabbage (to transplant) ...	1 lb.	Linseed, for flax ...	2½ bushels.
Kohl Rabi—ditto...	1 lb.	——— for seed...	3 to 4 pecks.
Ditto; drilled ...	4 lbs.		
Trifolium incarnatum	20 to 24 lbs.	Grass Seeds vary according to soil and purposes.	

Not bound by the above prices after March 1, *as Seeds are scarce this season, and will probably be worth much higher rates.*

One of the finest exhibitions of Mangold Wurzel, Carrots, Swedes, Turnips, and other Roots (open to all England) was held at the Reading Cattle Show, on 1st December, 1853. The competitors were very numerous, but we had the satisfaction of observing that the whole of the prizes were gained by roots raised from seeds purchased of us. This was the case also (with one exception) at the previous annual show. The Editor of the *Berkshire Chronicle*, at the conclusion of his report of the above show, remarked:—"No doubt the excellence of these roots must be mainly attributed to the cultivation, but it is worthy of remark that every prize was won by roots grown from Messrs. SUTTON'S seeds."—See *Berkshire Chronicle*, Dec. 10, 1853.

At the Annual Root Show held at Basingstoke, Hants, on December 21, at which a large number of prizes was awarded for root crops, the whole of the prizes (except two) were gained with the produce of our seeds; and we are constantly hearing from our customers in other parts of the kingdom of their similar success, all which strongly confirms our opinion and practice in saving seeds, viz., *that for success in growing root crops attention to the stocks from which the seed is saved is as important as in the breeding and fattening of cattle.*"

SUTTON'S PERMANENT GRASS SEEDS.

Gentlemen intending to lay down Land to Permanent Pasture, or for one or two years lay, are recommended to communicate with us, stating the nature of the soil and situation, that we may advise as to sorts of Grass Seeds most suitable.

OLD MEADOWS DEFICIENT OF THE MOST NUTRITIVE GRASSES AND CLOVERS may be greatly improved by sowing at this season "SUTTON'S Renovating Mixture" of Seeds at the rate of 8 to 12 lbs. per acre, price 1*s.* per lb. Our finest LAWN GRASS SEEDS *are highly useful to improve Garden Lawns or to form new ones.*

The following sorts of NATURAL and ARTIFICIAL GRASSES MAY BE HAD SEPARATE, at low prices. All the best and most suitable of them are contained in MESSRS. SUTTON'S MIXTURES.

Achillea millefolium (Yarrow)
Agrostis stolonifera (Creeping Bent)
Anthoxanthum odoratum (Sweet Vernal)
Alopecurus pratensis (Meadow Foxtail)
Avena flavescens (yellow Oat Grass)
Agrostis alba (white Bent Grass)
Agrostis vulgaris (common Bent Grass)
Bromus arvensis (Field Brome Grass)
Cynosurus cristatus (Crested Dogstail)
Dactylis glomerata (round-headed Cocksfoot)
Festuca duriuscula (hard Fescue)
Festuca loliacea (Darnel Fescue)
Festuca ovina (Sheep's Fescue)
Festuca rubra (red Fescue)
Festuca pratensis (Meadow Fescue)
Festuca elatior (Tall Fescue
Festuca heterophylla (various-leaved)
Festuca tenuifolia (fine-leaved Fescue)
Glyceria aquatica (water sweet Grass)
Holcus avenaceus (tall Oat-like Grass)
Hordeum bulbosum (bulbous Barley Grass)
Lolium perenne (Perennial Rye-grass)
Lolium perenne sempervirens
Lolium perenne Paceyanum
Lolium perenne Stickneyanum
Lolium perenne tenue
Lolium italicum (Italian Rye-grass)
Lotus corniculatus (Bird's-foot Trefoil)
Medicago lupulina (black Medick Grass, or yellow Trefoil)
Phleum pratense (Timothy)
Poa nemoralis (wood Meadow Grass)
Poa pratensis (smooth Meadow Grass)
Poa trivialis (rough Meadow Grass)
Poa fertilis (fertile Meadow Grass)
Poa sempervirens (evergreen)
Trifolium minus (red Suckling) [Clover]
Trifolium pratense perenne (Perennial red
Trifolium repens (white Clover), best
Trifolium hybridum (Alsike Clover)

And many other kinds, a Priced List of which may be had on application, post free.

As some Agriculturists feel a pleasure in making their own selection of Grass Seeds, the above List is presented, but the greatest economy and certainty of success will be obtained by procuring Messrs. SUTTON'S *Mixtures.*

*** *Sacks and Bags are charged at cost price only, and the full amount allowed, if they are returned.*

NOTICE TO EXHIBITORS.

CHELTENHAM GREAT EXHIBITION. To Open June 1st, 1854.—Applications for Space under Sections II. & III., must be made previous to the 25th of March. Official Forms may be obtained of the Secretary, Mr. HENRY J. COCHRANE, 128, High Street, Cheltenham.

GARDENERS' BENEVOLENT INSTITUTION.—The FRIENDS of ROBERT OLIVER (for 11 years a Subscriber to the above Institution), return thanks to those members of the Society who kindly favoured him with their Votes at the late Election, and beg their renewed exertions to secure his success at the next.

SUPERB DOUBLE HOLLYHOCKS.

WILLIAM CHATER has now ready a fine healthy stock of young plants of all the leading sorts. For price and description see General List, which also contains hints on their culture, with observations on the exhibition of Hollyhocks, &c. &c., and may be had by inclosing a postage stamp.
Saffron Walden Nursery, February 4.

SUPERB FLOWER SEEDS.—The following select Seeds, saved from the best varieties, sent post free at 1*s*. per paper:—Antirrhinum, Petunia, Verbena, Double Balsam, and Pansy.—From WILLIAM KNIGHT, Florist, 53, High Street, Battle, Sussex. Select lists of Seeds sent on application.

THE EARLIEST PEA is "FAIRHEAD'S EARLY CONQUEROR." To be had of CLARKE AND CO., Borough, London; 2*s*. per quart (price per bushel on application).

CORNWELL'S VICTORIA RASPBERRY; unequalled for size, flavour, and brightness of colour—containing more juice than any other, and an abundant bearer. The certificate of merit has been awarded to them at all the principal metropolitan shows; the fruit also sells for more than any other at Covent Garden Market. Canes of the above to be had of GEORGE CORNWELL, Market Gardener, Barnet, at 15*s*. per 100. The usual allowance to the trade.

GRASS SEEDS.—Gentlemen intending to lay down land to Permanent Pasture, or for one or two years' lay, are recommended to communicate with us, stating the nature of the soil and situation, that we may advise as to sorts of Grass Seeds most suitable. OLD MEADOWS DEFICIENT OF THE MOST NUTRITIVE GRASSES AND CLOVERS may be greatly improved by sowing at this season "SUTTON'S" "Renovating Mixture" of Seeds at the rate of 8 to 12 lbs. per acre, price 1*s*. per lb.
OUR FINEST LAWN GRASS SEEDS are highly useful to improve Garden Lawns.
N.B. We are extensive growers of Mangold Wurzel, Turnip, and other Agricultural Seeds, of which a separate Catalogue is published.
JOHN SUTTON & SONS, SEED GROWERS, READING, BERKS.

SEEDS.

W. AND S. GAINES beg to offer to Gardeners, Farmers, and Nurserymen, the following seeds:—WHITE SPANISH ONIONS, 4*s*. 6*d*. per lb.; Deptford do., 4*s*. 6*d*. per lb.; Reading do., 4*s*. per lb.; quantities not less than 1 lb. SCARLET RUNNERS, 2*s*. per bushel; quantities not less than one peck. GOOD RHUBARB PLANTS: Albert, Linnæus, and Victoria, 40*s*. per 100; 6*s*. per dozen. Also collections of ANNUAL FLOWER SEEDS, packets of 60 varieties, 10*s*.; 30 do., 5*s*.; 15 do., 2*s*. 6*d*.—Post-office orders payable to W. & S. GAINES, Covent Garden Market, London.

THE BLACK BARBAROSSA,
"A GRAPE THAT DON'T KNOW HOW TO SHANK."

JOHN BUTCHER has on sale true plants of the above splendid late Grape; families may obtain fruit of the above through the months from January to April. For further particulars see *Gardeners' Chronicle* of Oct. 23, 1852, page 678, &c., and Oct. 18, 1853. Fruiting Plants, 10*s*. 6*d*.; Good Plants, 5*s*. 6*d*. each. May be obtained of Messrs. DAWE, COTTRELL & BENHAM, 36, Moorgate Street, London; and JOHN BUTCHER, Nurseryman, Stratford-on-Avon. A sample of berries sent on receipt of twelve postage stamps post free.

JOHN JEYES, NURSERYMAN and SEED-MERCHANT, Northampton, begs to offer Agricultural Seeds of every kind and the best quality: Horticultural and Floricultural Seeds in great variety and of the choicest selection; Ornamental Shrubs and Trees of various sizes and immense variety; a Fine Collection of Roses; Fruit Trees carefully selected from the finest proved sorts; a large Stock of Forest Trees; Russian Mats.
Plans and Estimates given for making Pleasure Grounds, Cemeteries, &c. Seeds selected and packed for Exportation.
Experienced Gardeners recommended.

WILLIAM NICHOLSON still continues to send out very strong well-rooted Plants of his four new and distinct varieties of STRAWBERRIES, viz., AJAX, dessert Fruit; RUBY, ditto; CAPTAIN COOK, Market Fruit; FILLBASKET, ditto, at 15*s*. per 100, or 25 each of any two sorts for 10*s*., box included. Post-office orders payable at Yarm, Yorkshire. For a full description, see Advertisement *Gardeners' Chronicle*, Jan. 28, 1854.—Eggleseliffe, near Yarm, Yorkshire.

TO FARMERS.

IN ACCORDANCE with the wishes of Farmers, Millers, and others interested in the Corn Trade, an Edition of the AGRICULTURAL GAZETTE AND GARDENERS' CHRONICLE will be published every Monday Afternoon, in time for post. The Monday's Edition will, in addition to the usual markets, contain a full report of the Mark Lane, Smithfield, and Newgate Markets of the day.—May be ordered of any Newsagent. Price 6*d*.

ROSES.

A. PAUL AND SON can still supply good plants of most of the fine new and popular sorts, either as Dwarfs or Standards. Priced Descriptive Catalogue forwarded free by post for two stamps.—Nurseries, Cheshunt, Herts, Feb. 4.

GRASS SEEDS FOR PERMANENT PASTURE.

WHEELER AND SON'S DESCRIPTIVE LIST of GRASS SEEDS will be forwarded free on application.
J. C. WHEELER AND SONS, GLOUCESTER.

LARGE YELLOW GLOBE MANGOLD WURZEL, WHITE BELGIAN CARROT, TRUE BRONZE TOP SWEDE TURNIPS, and all other Farm Seeds. Our Priced List for February is now ready, and will be forwarded free on application.
J. C. WHEELER AND SONS, Gloucester, SEEDSMEN to the Gloucestershire Agricultural Society.

PRESENT PRICES OF AGRICULTURAL SEEDS.—*See* MESSRS. SUTTON'S DESCRIPTIVE LIST, *on the last page of* GARDENERS' CHRONICLE *for January* 28.

RENDLE'S NEW PRICE CURRENT FOR 1854 *should be obtained by all who have gardens, whether small or large. It will be found to be a correct and useful Guide to the amateur and young gardener; a remembrancer to the more advancedin horticulture, and a source of reference to all.*
Can be obtained from the London Publishing Office, 294, Strand; or from the Proprietors, WILLIAM E. RENDLE & CO., Seed Merchants, Plymouth. ESTABLISHED 1786.

GENUINE SEEDS.

JAMES CHARTRES and Co. beg to announce that their Catalogue of the above is now ready, and will be forwarded on application.—Seed Warehouse, 74, King William Street, City, London; February, 1854.

DENYER'S SHORT AND DESCRIPTIVE LIST OF SEEDS, containing all that is New and Rare—the *inferior sorts are omitted*. Copies of the above forwarded on application, by WILLIAM DENYER, Seedsman and Florist, 82, Gracechurch Street, London.

MESSRS. J. and H. BROWN'S NEW CATALOGUE of GREENHOUSE PLANTS, HARDY SHRUBS, CONIFERS, &c. Can be had by Post, also a separate List of Garden and Flower Seeds, for American Plants, Fruit Trees, &c. See our Advertisement of January 14th. Albion Nursery, Stoke Newington, London.

STANDISH AND NOBLE'S CATALOGUE for the present season is Now Ready, and may be had on application. A selection from it appeared as a detailed advertisement in the *Gardeners' Chronicle*, of Saturday, Sept. 10th, to which they respectfully refer plant buyers. It contains many new and choice plants.—The Nursery, Bagshot, Surrey, Feb. 4.

CHARLES ALEXANDER (late of DICKSONS & Co.), SEEDSMAN and FLORIST, 32, West Register Street, Edinburgh. His Descriptive Catalogue of Select Garden and Flower Seeds is just published and will be forwarded free on application.

ESPARY, NURSERYMAN, FLORIST, and SEEDSMAN, respectfully announces that his CATALOGUE of Dahlias, Chrysanthemums, Fuchsias, Geraniums, Verbenas, Stove and Greenhouse Plants, Vines, Seeds, &c., &c., may be had on application.—Queen's Graperies, and 176, Western Road, Brighton.

SAMUEL FINNEY AND CO.'S DESCRIPTIVE CATALOGUE OF FLOWER AND VEGETABLE SEEDS, with prices, is now ready, and may be had on application. It contains an extensive assortment of Imported German Flower Seeds, the celebrated French Asters, and many splendid novelties.—Gateshead Nursery, January 28.

AMERICAN PLANTS.

JOHN WATERER begs to announce that his NEW CATALOGUE of RHODODENDRONS, AZALEAS, CONIFEROUS PLANTS, &c., is now published, and may be had by enclosing two stamps for postage.
The colours of all the Rhododendrons worthy of cultivation are described in order to facilitate purchasers in making selections, together with a Treatise on their successful management.
☞ The Rhododendrons forming the American Exhibitions in the Royal Botanic Society's Garden, Regent's Park, London, are annually supplied from this establishment.
The American Nursery, Bagshot, Surrey, near the Farnborough Station, South-Western Railway, and 3 miles from Blackwater, South-Eastern Railway.

GEORGE BAKER begs to say that his DESCRIPTIVE CATALOGUE of AMERICAN PLANTS, CONIFERS, ORNAMENTAL SHRUBS, FRUIT and FOREST TREES, &c., may be had by enclosing two postage stamps.
G. B. wishes to call particular attention to his fine Stock of GREEN and WEEPING HOLLIES from 1 to 12 feet high.
G. B. has supplied the American Exhibition in the Royal Botanic Gardens, Regent's Park, from its commencement.
American Nursery, Windlesham, near Bagshot, Surrey, about six miles from Staines Station, Windsor Branch, South-Western Railway, where conveyances may be obtained.

JUDSON'S
RICHMOND VILLA BLACK HAMBURGH VINE.

ARTHUR HENDERSON AND CO. have the pleasure of informing their patrons and friends that they have good plants of this valuable and much-esteemed Vine at 5*s*. each; extra strong plants. 7*s*. each.—N.B. For full particulars of the distinguishing characteristics of this Vine, we beg to refer our customers to the *Gardeners' Chronicle* of October 25th, 1851.

MYATT'S VICTORIA RHUBARB.—For Sale, 4000 VICTORIA (true) RHUBARB ROOTS, in lots, to suit purchasers. Price on application.—Address JOHN SCHOFIELD & SON, Seedsmen, &c., Knowsthorpe, near Leeds, Yorkshire.

J. G. WAITE begs to return thanks to his friends and purchasers of the DANIEL O'ROURKE PEAS, and to inform them and the public generally, that on account of the extraordinary demand for this valuable Pea, he will not be able to supply any more this season.
J. G. W. will be ready to supply seed of this year's crop in the months of July and August.—181, High Holborn, London.

BLUE SCIMETAR PEAS (warranted).—May be had of T. K. THEDAM, Little Braxted, near Witham, Essex, at 12*s*. 6*d*. per bushel, carefully drawn, 14*s*.

GEORGE MILLS, Uxbridge Road, Ealing, begs to offer Plants of his best BLACK or WHITE-SPINED CUCUMBER, unpacked, at 1*s*. each; packed, 1*s*. 3*d*. each.
MELON PLANTS of the best kinds raised to order on the same terms.

DOUBLE ITALIAN TUBEROSE ROOTS, 4*s*. per dozen.—The annual importation of the above-named beautiful and fragrant Flower has just been received, and large and well selected Bulbs may be obtained, without disappointment, at A. CORBETT'S Foreign Warehouse, 18, Pall Mall.
N.B. Printed regulations for treatment sent; also, just arrived very moist and open Parmasan Cheeses.

THE FINEST BALSAMS IN EUROPE, in Six Classes; Seed saved by Mr. GLENNY from flowers three inches across: the six, 37 stamps; Mixed Seeds, 13 stamps, in Sealed Packets only, signed and sealed. The finest seeds that can be had procured to order, and all other choice Horticultural subjects.—420, Strand.

TO BE SOLD, a variety of the best kinds of GOOSEBERRY BUSHES (two years' growth), viz., Riflemen, Keene's Seedlings, and Crown Bobs; 25,000 in quantities of not less than 1000. Price per thousand, 5*l*. Terms, cash.—Apply to JAMES NORRIS, Sion Hill, Bradford End.

TALAVERA WHEAT FOR SEED.—MR. OWEN, of Brockly Farm, Lewisham, begs to inform Agriculturists that he has some of the above WHEAT for Sale—a fine sample and true—at 12*s*. 6*d*. per bushel.

LARCHES.

DREGHORN AND AITKEN, NURSERYMEN and SEEDSMEN, Kilmarnock, N.B., beg leave to offer a considerable quantity of FINE THREE YEARS TRANSPLANTED LARCHES, 2½ to 3½ feet; which they will deliver carriage free at London, Liverpool, Manchester, or any of the Railway Stations in connection with the Glasgow and South Western, for 15*s*. per 1000, if not less than from 5000 to 10,000 are taken.
Kilmarnock, February, 4.

TO PLANTERS AND OTHERS.

LARCH.—A large quantity of fine, three-year transplanted LARCH (2 to 3 feet, grown on poor land, in high and exposed situations) will be Sold cheap.—Apply to SAMUEL FINNEY & Co., Gateshead, Newcastle-upon-Tyne.

JOHN SCHOLEY, NURSERYMAN, &c., Pontefract, Yorkshire, begs to announce that he has a fine Stock of LARCH, from 1½ to 4 feet, well topped, and fibrous rooted. Also a large quantity of Seedling and Transplanted Berberis aquifolium. Prices moderate, may be had on application.

T. AUSTEN, NURSERYMAN, near the Green Man, Blackheath Hill, Greenwich, begs to announce that he has 55,000 ASH, 4, 6, and 8 years' growth. Also a very large stock of EVERGREENS and other plants, at a very moderate price.

LIME TREES, 12 to 14 feet, 42*s*. per 100.—SPRUCE FIRS, 2 to 3 feet, 6*s*. per 100.—LAURUSTINUS, very fine, 30*s*. per 100.—Apply to BENJAMIN R. CANT, St. John's Street Nursery, Colchester.

CHOICE FRUIT TREES.

JOHN ADAMS, NURSERYMAN AND SEEDSMAN, Brompton Park, Kensington Gore, London, begs to call the attention of the trade, and planters generally, to his extensive Stock of FRUIT TREES, embracing all the best varieties in cultivation, under their correct nomenclature; but more particularly to his Standard Trained Cherries, Plums, Pears, Apricots, Peaches, and Nectarines; Dwarf Trained Cherries, Pears, Plums, Peaches, and Apples; Standard Cherries, Plums, Pears, and fine large Mulberries; Dwarf Pears, Plums, Apples, and Nectarines, of which he has a large stock, all of first-rate quality.

TO POTATO GROWERS.

W. DRUMMOND AND SONS, SEEDSMEN and NURSERYMEN, Stirling, N. B., offer for sale several tons of ROS'S EARLY AMERICAN POTATOES, grown expressly for seed, on reclaimed peat or moor, and without manure. Not a trace of disease could be seen in the crop. The Potato has been well known in Scotland for the last 40 years, as one of the very best for general garden or field crops. It is very productive, full sized, dry, and finely flavoured; and is earlier than the Regent.
Price 22*s*. per sack of 2 cwt., sack included, and delivered carriage free in London, Liverpool, and Hull.
Unknown correspondents will please send a remittance with their orders.
May be had on application, a very useful priced Descriptive CATALOGUE of VEGETABLE SEEDS, containing only such varieties as are really worth cultivating.

CONQUEROR OF THE WEST CUCUMBER.

JAMES LAKE, NURSERYMAN, &c., Bridgewater, begs once more to offer the above Cucumber. Having tested its merits against many other sorts highly spoken of, can with confidence recommend it as the best for general frame culture. Packets containing 12 good Seeds sent post free on the receipt of 12 postage stamps.

N.B. The Trade supplied with the genuine article.

J. L. also begs to state that he will be prepared to send out, the first week in May, strong Plants of his beautiful Seedling Lobelia St. Clair, so universally admired last summer and autumn, at 12s. per dozen. The usual discount to the Trade.

February 3d.

SEED POTATOES.—The importance of cultivating those sorts of Potatoes which, from their vigorous habit of growth and early maturity, are least subject to disease, has induced us for several years (ever since the first general development of the disease), to make many experiments as to the sorts most desirable, and the cultivation most suitable.

Our New Seed List contains the names and prices of the principal kinds, and will be sent post free on receipt of One Penny Stamp.

Address, JOHN SUTTON and SONS, Seed Growers, Reading, Berks.

CHOICE FLOWER SEEDS, FOR PRESENT SOWING.

PANSY, saved from 100 of the best vars., by name, 2s. 6d. per pkt.

DAISY, do. 50 of the new Belgian do. do. 1s. 6d. "
ANTIRRHINUM, do. 20 best named varieties .. 1s. 0d. "
ANEMONE, from the most showy and brilliant kinds, 1s. "
FASTOLFF RASPBERRY SEED, for exportation, p. oz., 3s. 6d.

The above, per post, free.—Postage Stamps received in payment.

YOUELL AND CO., Royal Nursery, Great Yarmouth.

PAUL'S EARLY DWARF PROLIFIC PEA.—This Pea having proved itself one of the best early dwarf varieties, A. PAUL & SON have pleasure in offering it this season at 2s. per quart. May be obtained of them, or from Messrs. Noble & Co., 152, Fleet Street, and from Messrs. Hurst & McMullen, 6, Leadenhall Street, London.

N.B. A general assortment of Agricultural and Horticultural Seeds of the best quality and most approved races, at London prices. Catalogues free by post on application.

Nurseries, Cheshunt, Herts, Feb. 4.

"NORFOLK HERO" CUCUMBER. — Without exception the very best Cucumber for open ground cultivation that has yet been offered. It is a most prolific bearer, as handsome as any frame variety, and is as delicate in point of texture, the fruit measuring from 16 to 20 inches in length. It is in the sole possession of YOUELL and Co., who will forward per post free on receipt of postage stamps) packets containing six Seeds, 1s; 18 seeds, 2s. 6d.—"To Market Gardeners the above will be found a great acquisition."

Royal Nursery, Great Yarmouth.

AQUILEGIA GLANDULOSA (flowers 4 inches in diameter, blue and white.)—To insure a vigorous display of this, the handsomest of early summer flowers, the Subscribers will, on receipt of a Post-office order for 20s., forward free to London or Edinburgh a dozen strong flowering roots in balls of a congenial soil plants such as those for which they received the Honorary Premium of the Royal Caledonian Horticultural Society at the Exhibition in Edinburgh in May last. These roots are suitable for the open ground, but they are also well adapted for being forced into bloom early in spring.

Professor Lindley has said, "This plant is perhaps the handsomest hardy perennial in cultivation." Roots of the same sort can be obtained of Messrs. CHARLWOOD & CUMMINS, Seedsmen, 14, Tavistock Row, Covent Garden.

JOHN GRIGOR AND Co, Nurseries, Forres, N.B.

EXOTIC NURSERY, CANTERBURY.

WILLIAM MASTERS, at the commencement of a new season, has the pleasure to tender his very grateful thanks to his numerous Patrons for the very kind support with which they have favoured him during the last thirty-five years, and begs to solicit a continuance of the same on behalf of himself and his Son, with whom he has now entered into PARTNERSHIP, and who has been engaged with him in the practice of Landscape Gardening and the various branches of his business for some years.

WILLIAM MASTERS AND SON beg to offer the following Collections of GARDEN SEEDS, in assortments containing a supply for the whole year in proportionate quantities of each.

No. 1 Collection, for a large garden, containing 20 quarts of Peas in 20 best sorts for succession, 10 best sorts of Broccoli, 8 ditto of Lettuce, with all other vegetables in proportion £2 10 0
No. 2, the best new and other sorts, in smaller quantities 1 10 0
No. 3, ditto ditto 1 0 0
No. 4, a Collection of esteemed kinds for a small garden 0 10 0

Grass Seeds for Lawns, Permanent Pasture or alternate Culture.

FLOWER SEEDS, with printed Directions for their Culture, in Collections of 12 for 2s. 6d.; 25 for 5s.; 50 for 9s.; 100 for 18s.

Their New Seed Catalogue for 1854 will be forwarded on application.—February 4, 1854.

THE PLANTING SEASON.

FRANCIS AND ARTHUR DICKSON AND SONS respectfully invite the attention of Planters to their very extensive Stock of Forest and Ornamental Trees, Evergreens, and Flowering Shrubs, Fruit Trees, Roses, Herbaceous and Alpine Plants, Stove and Greenhouse Plants, &c., growing at their Upton Nursery Grounds, near Chester. The Nurseries lying high and exposed, the whole of their Plants are hardy and well-grown, and having been regularly transplanted are also well rooted, and cannot fail to give satisfaction.

The following Lists are published, and will be forwarded on application:—Forest and Ornamental Trees and Shrubs, Fruit Trees (Descriptive Catalogue), Roses (Descriptive Catalogue), Herbaceous and Alpine Plants, Stove and Greenhouse Plants, Dahlias, Bedding-out Plants, Florists' Flowers, &c.

☞ It being necessary to clear the plants off certain portions of their Grounds before the end of March, F. & A. D. & SONS will dispose of this part of their Stock at much reduced prices, rather than incur the expense of removing them to other parts of their Nurseries.—Upton Nurseries, Chester, Feb. 4.

NEW AND SUPERIOR SEEDS.

FRANCIS AND ARTHUR DICKSON AND SONS, respectfully intimate that their CATALOGUE OF VEGETABLE AND FLOWER SEEDS, &c., for the present season is published, and will be forwarded on application. Their Stock of NEW SEEDS is now complete, and as each article has been procured direct from the most particular and careful growers, they feel satisfied that the quality of their Seeds is such as cannot fail to merit the approbation of their customers and friends.

F. & A. D. & SONS further beg to assure their patrons that everything supplied by them shall be of the first quality; and that all orders entrusted to them shall be executed with fidelity and despatch.

Seed Warehouses, 106, Eastgate Street, Chester, and 14, Corporation Street, Manchester.—Feb. 4.

CHOICE SEEDS FOR PRESENT SOWING.

JOSEPH HENRY KNIGHT, SEEDSMAN, Battle, Sussex, begs to offer to the notice of those who wish for real genuine seeds the following:—

ANTIRRHINUM, from 70 kinds, including every shade of colour, striped, spotted, and mottled, 6d.

YOUELL & Co. beg to refer to their Advertisement of a choice and extensive Collection of Plants which appeared in this Paper of October 15, and January 14 and 21. Catalogues will be forwarded free on application.

YOUELL AND CO., Royal Nursery, Great Yarmouth.

IMPROVEMENT OF GRASS LANDS.

SUTTON'S RENOVATING GRASS SEEDS FOR IMPROVING OLD PASTURES.—Many Old Upland Pastures, Parks, and Meadows are nearly destitute of Clovers and the finer and more nutritious sorts of Grasses, in which case we are in the practice of furnishing such sorts only as are wanting. If the Seeds are *sown early in the season*, the improvement in the Pasture will be very considerable, and at a small expense.

The following is similar to many other letters received from former purchasers:—

From D. T. Cunynghame, Esq., Wellesbourne, Warwick, Nov. 1852.

"The meadows that were renovated with your Seeds are looking very well. I cut nearly 2 tons of hay to the acre, and three years ago the same land hardly produced half a ton per acre. The Garden Seeds I have had from you exceed by far any that I have bought elsewhere."

Quantity of Seed required, 8 lbs. to 12 lbs. per acre. Price 1s. per lb., Carriage Free.—Address

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

N.B.—We have a very fine Stock of Mangold Wurzel and Carrot Seed.

NEW SEEDS—GROWTH OF 1853.

RENDLE'S COLLECTION OF GARDEN SEEDS, FOR ONE YEAR, *will be sent out as usual by the Subscribers.*

The collections have given universal satisfaction, and they will be found sufficient to supply a garden during the whole of the 12 months.

	£	s.	d.
No. 1.—A complete Collection, to supply a large garden for 12 months, including 20 quarts of the newest and most approved Peas, for early, medium, and late crops; 10 quarts of Beans, and full quantities of all other kinds of vegetable seeds	3	0	0

For the detailed quantities contained in the No. 1 Collection, see back page Gardeners' Chronicle, Jan. 7, 1854.

No. 2.—A complete Collection, in reduced quantities, for a smaller garden	2	0	0
No. 3.—A complete Collection do.	1	5	0
No. 4.—A small and choice Collection	0	15	0

☞ *All orders above* 20s. *carriage free* (see PRICE CURRENT), *and all orders above* 5l. *delivered carriage free to every Railway Station in England and Wales, and to every Steam Port in England, Wales, Ireland, and Scotland.*

WILLIAM E. RENDLE & Co., Seed Merchants, ESTABLISHED 1786. Plymouth.

The quantities contained in the above Collections will be found in our PRICE CURRENT AND GARDEN DIRECTORY, *just published.*

"FASTOLFF RASPBERRY."—It is with much satisfaction that we announce a third award made by the London Horticultural Society, on 26th of July last, for examples of the above most excellent Raspberry, unequalled by any other variety for the size of its fruit and richness of flavour.

It is reported in the *Gardeners' Chronicle* of July 30th, page 486, as follows:—"Messrs. YOUELL, of Great Yarmouth, sent a boxful of beautiful fruit of the Fastolff Raspberry; they were unusually fine, and well deserved the certificate of merit awarded them."

Strong well-rooted canes, 15s. per 100: Large White Raspberry, 24s. per 100; New Monthly Fruiting, 24s. per 100.

CHOICE FRUITS. (Warranted true to name.)

Orders of 2l. and upwards are delivered Carriage Free to London or Hull, or to any Railway Station within 150 miles of the Nursery.

YOUELL AND CO., Royal Nursery, Great Yarmouth.

PEAS! PEAS! THE BEST VARIETY IN CULTIVATION.

CHAMPION OF ENGLAND, a blue wrinkled Pea, very productive, of quick growth, and of a most delicious flavour. This extraordinary Pea combines in one the merits of all others, and has none of their demerits; for, although a wrinkled Pea, it is both hardy and early, and being of quick growth, it is the best kind to plant throughout the season for each crop. It is highly productive, bearing very long pods of a lively green, which are well filled, and the Peas are generally as large as small horse Beans, of a deep green colour, and beyond all others of a most delicious flavour. Height, 3 ft. to 3½ ft.

Price, in quantities of not less than 1 peck ... Bag included			6s.
" " " 1 bushel... ...	"		16s.
" " " 1 sack (4 bushels)	"		60s.
" " " 8 bushels (1 qr.)	"		106s.

Delivered, freight paid by Railway to London.

Orders, with remittance or satisfactory reference, will have immediate attention on application to

H. AND A. WALLIS, SEEDSMEN, Ipswich.

CUCUMBERS, MELONS, &c., the best varieties in Cultivation:—

CUCUMBER SEED—Captivation, 2s. 6d. per packet; Phenomenon, 2s. 6d.; Victory of Bath, 1s.; Lord Keyuon's Favourite, winter Cucumber, 2s. 6d.; Gordon's White Spine, 1s.; Chamberlain's Essex Hero, 2s.; Sunderlandwick, 2s.; Hunter's Prolific, 1s.; and numerous others at 1s. per packet.

MELON SEED, at 1s. per packet—Incomparable, Bromham Hall, Golden Ball, Queen, Bowood, Victory of Bath, Camerton Court, Beechwood, Windsor Prize, Emperor, Fleming's Trentham Hybrid, Hampton Court, Blackhall's Green Flesh, Bailey's, and numerous others at 1s. per packet.

A packet of each of the first-named Cucumbers, and two packets of either of the Melons named, sent free for 60 stamps.

SUPERB HOLLYHOCK SEED, 2s. 6d. per packet.—GERMAN ASTER SEED (very fine and double), 1s. per packet.—ANTIRRHINUM SEED (splendid), 1s. per packet.—For further particulars respecting the before-mentioned Seeds see this Paper of the 21st inst.

A remittance must accompany every order by cash, or penny postage stamps, when the whole or any part of the above will be sent immediately, postage and package free.

EDWARD TILEY, NURSERYMAN, SEEDSMAN, & FLORIST, 14, Abbey Church Yard, Bath.

EXHIBITIONS IN THE GARDEN OF THE HORTICULTURAL SOCIETY OF LONDON, FOR THE YEAR 1854.

The EXHIBITIONS will take place on the Second Saturdays in May, June, and July; namely, MAY 13, JUNE 10, and JULY 8.

The following Medals and Rewards are offered:—

LG 1—First Large Gold Medal	... ...	value 15*l.*
LG 2—Second " "	... ...	" 12*l.*
GK 1—First Gold Knightian Medal	... ...	" 10*l.*
GK 2—Second " "	"	" 8*l.*
GB 1—First Gold Banksian	"	" 7*l.*
GB 2—Second " "	"	" 5*l.*
SG—Silver Gilt	"	" 4*l.*
LS—Large Silver	"	" 3*l.*
SK—Silver Knightian	"	" 2*l.*
SB—Silver Banksian	"	" 1*l.*
C 1—First Certificate	...	" 15*s.*
C 2—Second "	...	" 10*s.*

ATTENTION IS PARTICULARLY REQUESTED TO THIS NEW SCALE OF REWARDS.

SCHEDULE OF THE PRIZES.

DIVISION I.—ORNAMENTAL PLANTS.

1. Azaleas, greenhouse; in 12 distinct varieties. GK 2—GB 1—GB 2.

2. Greenhouse Azaleas; in 6 distinct varieties in 8-inch pots. SG—LS—SK.

N.B. No one can show in 1 and 2 at the same time.

3. Calosanths; in sixes. SK—SB—C 1. (*In July only.*)

4. Tall Cacti; 6 distinct varieties in flower. LS—SK—SB.

5. Ferns; very distinct hothouse kinds, in twelves. LS—SK—SB. (*In July only.*)

6. Helichrysums; in sixes. SK—SB—C 1.

7. Cape Heaths; in collections of 10 entirely distinct varieties. GB 1—GB 2—SG.

N.B. It is expected that the same plant shall not be exhibited on more than one occasion. The Judges, in making their award, will give, both in this and the next number, a marked preference to plants grown in their natural form without stakes or stays; and will also take distinctness of species into favourable consideration. No duplicate will be allowable. No one can take more than one prize in the two classes of Heaths.

8. Six distinct Cape Heaths. LS—SK—SB.

9. Miscellaneous variegated plants, in collections. SG—LS—SK. (*In June and July only.*)

10. Miscellaneous tender ornamental plants, remarkable for fine foliage, not in flower, in collections. LS—SK—SB. (*In June and July only.*)

11. Miscellaneous single plants. SB—C 1—C 2.

N.B. Exhibitors in this class will not be thereby *entitled* to a pass ticket. Heaths, Cockscombs, Heartsease, Hydrangeas, and bouquets, together with all plants for which separate prizes are offered, are altogether excluded from this number.

12. Newly introduced or extremely rare SPECIES of ornamental plants in flower, not introduced by the Society. SG—LS—SK—SB.

N.B. These Medals will be awarded by the Society's officers, and not by the usual judges. Exhibitors will particularly observe that none but new or rare plants can be exhibited under this number. *Nothing will be regarded as new which has been exhibited in the Garden or Regent Street in a previous season.* No prizes will be given to New Plants which have been introduced through the Society.

13. Exotic Orchids; in collections of 20 species of superior cultivation. LG 1—LG 2—GK 1—GK 2—GB 1—GB 2.

14. Exotic Orchids; in collections of 10 species of superior cultivation. GB 1—GB 2—SG—LS.

N.B. Nurserymen cannot show under either No. 13 or 14. No exhibitor can show in more than one of them.

15. Exotic Orchids; in collections of 15 species of superior cultivation. GB 1—GB 2—SG—LS. *Nurserymen only can exhibit under this number.*

16. Pelargoniums; in collections of 12, cultivated with superior skill in 8-inch pots. GB 1—GB 2—SG.

N.B. The collections in which varieties are most distinct *will have the preference.*

17. Six distinct Fancy Pelargoniums; in 8-inch pots. LS—SK—SB.

18. Roses, in pots; in collections of 12 distinct varieties, in 13-inch pots. GB 1—GB 2—SG—LS. (*In May and June only.*) *Nurserymen and Private Growers exhibit separately.*

N.B. The Judges will disqualify any collection that shall be found to contain a plant which has been recently placed in the pot from the open ground, or that is shown in a pot of any other size than 13 inches.

19. Roses of 50 varieties in loose bunches, each consisting of three trusses as they are gathered, so as to exhibit, as far as possible, the habit of the variety. LS—SK—SB. (*In July only.*)

N.B. No one who exhibits in this number can also compete in the following.

20. Roses exhibited as in No. 19, but in 25 varieties. SK—SB—C 1. (*In June and July only.*)

N.B. Private growers only can exhibit here. If Roses are brought for exhibition without attention to the regulations here explained, they will not be allowed to compete.

21. Stove or Greenhouse plants; in collections of 20 plants. LG 1—LG 2—GK 1—GK 2.

N.B. Calceolarias, Fuchsias, Orchids, and Pelargoniums, are excluded from all the four classes of Stove or Greenhouse plants. Only two species or varieties of the same genus can be allowed, in this and the following number, and no two specimens of the same kind.

22. Stove or Greenhouse plants; in collections of 15 plants. GB 1—GB 2—SG.

23. Stove or Greenhouse plants; in collections of 6 plants, in pots or tubs not less than 20 inches in diameter. GB 1—GB 2—SG.

24. Stove or Greenhouse plants; in collections of 6 plants, in pots not exceeding 13 inches in diameter. SG—LS—SK—SB.

N.B. Not more than one species of the same genus can be allowed in NOS. 23 and 24. No one can show in more than one of the classes of Stove or Greenhouse plants, except No. 23.

25. Single specimens of very superior cultivation, excluding everything which can be shown singly in other numbers, and plants not in flower. SK—SB—C 1.

N.B. No one can take more than one prize in this number.

DIVISION II.—FRUIT.

N.B. All fruit must be ripe enough for market, well coloured, and properly named. Fruiterers cannot exhibit.

Under this head the Council place at the disposal of the Judges the following amount, viz.,

In MAY, a sum not exceeding	... ...	£50
In JUNE, "	... ...	60
In JULY, "	... ...	70

The Judges will be at liberty to apportion this sum among the exhibitors in such manner as they may think fit. No classification of fruit is now proposed, it being the desire of the Council to afford gardeners the greatest possible freedom of action—thus enabling those who wish to exhibit collections of any kind to do so, and others with smaller means to produce their Grapes, Pine-apples, Melons, Strawberries, &c., separately, or as may best suit their convenience.

If the whole sum allotted to the May exhibition is, in the opinion of the Judges, not then required, the difference between the amount awarded and the sum allowed will be added to that divisible in June. And if the total sum thus made available for June is not then expended, in that case the surplus will be added to what is offered in July. Should the judges find that the whole sum thus finally made available in July is not required, then the difference is to be carried to the credit of the Society.

ESTABLISHED ABOUT HALF A CENTURY.

SEED AND HORTICULTURAL ESTABLISHMENT,

SUDBURY, SUFFOLK.

BASS AND BROWN'S SEED AND PLANT LIST FOR 1854 is now complete, and supplied free for three penny stamps. It contains a considerable number of new and very choice kinds, both of Seeds and Plants, and much useful information.

In offering the 23d Annual Edition of our Seed Catalogue, we would remark that the usual care and attention have been bestowed in the selection and growth of every article which has come under our hands, and as our aim is to render our Stock as select as possible, the most scrupulous care is paid to avoid such as are not really an acquisition and calculated to give perfect satisfaction. Our List of Vegetable Seeds contains many valuable new additions, and in the Flower Seed department are several rich gems of recent introduction.

Owing to the late ungenial season for ripening and harvesting Seeds, which has rendered them very scarce, the prices of many are higher than previous years.

GOODS (not under 20s) CARRIAGE FREE to all Stations in London.

A Copy of the Autumn Catalogue also supplied for three penny stamps.

ASSORTED COLLECTIONS OF VEGETABLE SEEDS.

The following, comprising the best in cultivation, including several new sorts of first-rate quality:—

No. 1.—COLLECTION FOR A LARGE GARDEN, containing quantities sufficient for one year's supply	... ... £3 0 0

PYRAMIDAL PEAR TREES ON THE QUINCE STOCK.

J. AND J. FRASER, NURSERYMEN, Lea Bridge Road, Essex, beg to offer the above in fine strong trees, and such as would fruit the first and second year after planting, at the undernamed prices. These Pears are remarkable for their compact style of growth and prolific bearing; the collection comprises the following fine sorts:—Beurré d'Amanlis, Beurré d'Aremberg, Beurré de Capiaumont, Beurré Diel, Beurré Easter, Beurré Grise d'Hiver, Nouveau, Beurré Rance, Williams's Bon Chretien, Crassane, White Doyenné, Duchesse d'Angoulême, Forelle or Trout Pear, Glout Morceau, Hacon's Incomparable, Jargonelle, Louise Bonne of Jersey, Marie Louise, Napoleon, Winter Nelis, and Passe Colmar.—Price 2*s.* 6*d.* to 3*s.* 6*d.* each.

SEEDS—CARRIAGE FREE.

WILLIAM E. RENDLE AND CO. *have, from the very extensive patronage they have received, been induced this season to offer the following liberal arrangement to all who purchase Seeds from their establishment.*

ALL ORDERS ABOVE £5 WILL BE DELIVERED CARRIAGE FREE TO ANY RAILWAY STATION IN ENGLAND OR WALES, AND TO ANY STEAM PORT IN ENGLAND, WALES, IRELAND, OR SCOTLAND.

Two or three purchasers joining together will therefore have the advantage of having their orders delivered free of any cost for carriage.

RENDLE'S PRICE CURRENT FOR 1854 should be obtained by all who have gardens, or who take an interest in the cultivation of the soil.

The Gardeners' Chronicle.

SATURDAY, FEBRUARY 4, 1854.

PLOUGH *v.* SPADE. Which is the better implement? That is the question. The rhodomontade of GISBORNE and the letter of our good correspondent "SINOPE," have between them brought this cause to trial. We appear for the defendant.

The case of the plain iff, as we understand it, is that the plough is a reality and the spade a humbug; that the plough is an implement of unknown anti-

quity, the value of which is established by usage beyond the memory of man, while the spade is a poor, insignificant modern contrivance; that the plough always beats the spade, as any country gentleman who grows Potatoes very well knows, because the first is more efficient than the spade; that the plough is wonderful upon "cloddy" land, where the spade is powerless; and, finally, that the spade led to Irish pauperism, leaving the plough to remedy the mischief. Such appears to us to be the plaintiff's case as far as it can be collected from the pleadings in GISBORNE'S *Essays on Agriculture*, edition of 1854, pp. 247 and 248.

To this we answer, that of all the misstatements of which we have knowledge the plaintiff's are the greatest; that there is no truth in any one single allegation; and that the real difference between the respective cases of PLOUGH and SPADE, a difference we are far from denying, was either unknown to him, or not mentioned, and such as in no degree affects the main argument. We say that in reality the plough belongs to the category of barbarous implements, such as hatchets and adzes, while the spade is a distinguished member of the family of saws and planes. As none but a barbarian would place a hatchet above a saw, or an adze above a plane, unless in exceptional cases, so it must still be a barbarian who would think of giving precedence in rank to PLOUGH over SPADE.

For what is this plough, this much vaunted implement, really good for? Can it break into the depths of the soil, and continually bring to the surface the unexhausted and inexhaustible elements of fertility? Can it turn up land 2 feet deep? Or having so turned it, can it leave behind, in a loose permeable state, the earth in which roots are to penetrate? These are the results which are attained by the spade, and they are results to which the cultivator, be he farmer, be he gardener, must mainly look for any great improvement in his crops. But the plough can do nothing of the kind. At the worst it scrapes away the surface of the soil; or turns in a little stubble, or pretends to bury weeds; at the best it loosens the staple a few inches deep, but the deeper it goes the more it compresses the soil over which it travels, consolidating on the one hand as much as it loosens on the other.

Deep cultivation is indispensable to complete success in husbandry; the plough is but a shallow operator; therefore complete success in husbandry is unattainable by a plough. That is a fixed principle, the truth of which all good gardeners fully understand. Their whole practice is founded upon it; as is clearly pointed out by Mr. BAILEY, himself one of our most experienced horticulturists, in an excellent article published in our columns a week or two since.

No where are crops so heavy as in good gardens; no where is land so fruitful. People say that this is owing to manure; but many of our readers can tell a very different tale; for they know from experience that the steward or farm-bailiff takes especial care that the gardener is not over supplied with so valuable an article. The reason is that the plough is not a garden implement; the trust of a gardener is in his spade. Not that we deny in any degree whatsoever the importance of manure; it is wanted in a garden much more than in a farm, for without it heavy root crops and succulent vegetables are unattainable; while it is as certain as anything can be that in good land cereal crops do not need manure, provided they have proper tillage. We say this to prevent misapprehension, although it is immaterial to the question now before us, which should be strictly limited to the comparative merits of the plough and the spade as implements for cultivating land.

Mr. GISBORNE says, "Do the roots of esculents wish to penetrate into the earth—at least, to the depth of some feet? We believe that they do. We are sure of the Brassica tribe, Grass, and Clover. All our experience and observation deny the doctrine that roots only ramble when they are stinted of food; that 6 inches well manured is quite enough, better than more. Ask the Jerseyman; he will show you a Parsnip as thick as your thigh, and as long as your leg, and will tell you of the advantages of 14 feet of dry soil. You will hear of Parsnips whose roots descend to unsearchable depths. We will not appeal to the Kentucky Carrot, which was drawn out by its roots at the antipodes; but Mr. MECHI'S, if we remember right, was a dozen feet or more. Three years ago, in a midland county, a field of good land in good cultivation, and richly manured, produced a heavy crop of Cabbages. In November of that year we saw that field broken into in several places, and at the depth of 4 feet the soil (a tenacious marl, fully stiff enough for brick earth), was occupied by the roots of Cabbage, not sparingly—not mere capillæ—but fibres of the size of small packthread."

This is an important admission on the part of the plaintiff in the case before us, although what every gardener knows to be true. Such being the fact, let us ask how far the plough is capable of rendering land fit for the vigorous growth of plants whose roots commonly penetrate the soil even 2 or 3 feet. All the plough can do is to loosen a few inches of earth upon the surface; what lies below it has never been moved from the day when the plough was a crooked stick dragged by an ox. The spade, on the contrary, penetrates the soil to any depth which may be required, mixes the particles thoroughly, and leaves them loose, with free access for the air and water upon which the deep-searching roots are nourished. The depth to which a plough can go is limited by its own nature; the depth to which a spade can operate is limited by expense.

In fact the question is one of cost and of nothing else. It cannot be seriously contended that the plough is in reality so efficient as the spade; all that can be rationally insisted upon is that it is far cheaper. Into that argument we need not enter; we may indeed concede the point without injury to the case of our client, who can afford to be regarded as a costly operator, if his efficiency is unimpeached.

But need the spade be for ever costly? Is mechanical skill so low that no means can be found of impelling it by other hands than those of man? We have seen the flail disappear before a small machine; we have seen the human fingers replaced in a cotton mill by joints of iron obeying the impulse of machinery; we have the hand replaced by a few knives in carving figures out of paper; and can no one discover how to represent the thews and sinews of a peasant by similar contrivances? To say so would be to libel the mechanical skill of the age; and we confidently believe that the immense superiority of the spade over the plough having been once admitted in the abstract, we shall at no distant period find our labourers directing fire and water to execute their will, instead of exhausting their own powers in an eternal struggle with mother earth. Whenever that occurs we shall know how to appreciate the real fertility of our land—and not till then.

THERE are some points in the prize list of the PEEBLESHIRE HORTICULTURAL SOCIETY, a thriving and useful body, upon which we think a few words will not be ill bestowed. We say nothing of the Gardeners' and Amateurs' lists, which we doubt not are suited to the means and wants of the locality; it is to the cottagers' prizes that we would direct attention. In addition to the customary small fruits and ordinary culinary plants, always to be encouraged by such associations, we observe that such flowers as Asters, Pentstemons, hardy herbaceous plants generally, Fuchsias, and even greenhouse plants are included. This leads to the impression that a Peebleshire cottager must be in a better social position than our ordinary English peasants. We also find the following subjects proposed by the neighbouring gentry: 1, for the best bouquet of Roses and Honeysuckles, grown on the front wall or porch of the exhibitor's cottage, to *be continued for five years*—this prize, offered by Lady MONTGOMERY, must have far more effect than a chance prize given to-day and withheld to-morrow; 2, for the neatest kept cottage; and 3, for the best kept cottage doors.

Would it not be as well if prizes of this kind were introduced into the local shows of England, where there is quite as much need of such encouragement as in Scotland. A neat garden, a smart porch, and a tidy cottage are among the most effectual means of promoting the happiness of the labourer; and the time necessarily consumed at home in the attempt to excel his neighbours in such particulars is of itself enough to ensure domestic habits, which, like the acquired habits of all created things, once fixed become all but ineradicable.

VEGETABLE PATHOLOGY.—No. V.

I.—PLANTS IN A STATE OF HEALTH.

4. In order to appreciate correctly the morbid changes which take place in vegetables, we must first have a distinct notion of their structure and condition in a state of health. The first question then which arises is, what is a vegetable? Now the different divisions of organised beings are so intimately connected that it is almost impossible to frame any set of words which shall in a small compass strictly define any particular division beyond the possibility of dispute. In general, however, we may define plants as organised beings, composed of cells variously combined and modified, by which they are directly or indirectly multiplied, and destitute of voluntary motion.

5. In some of the lower aquatic or subaquatic vegetables the reproductive bodies are clothed with short extremely delicate vibrating threads, whose constant motion produces eddies, in consequence of which a change of place and probably other ends are effected; and in some again, especially though not exclusively in what are called spermatozoides, there are a few terminal flagelliform processes precisely like those which occur in certain lower animals, by means of which the bodies move about from place to place, and seem to exercise

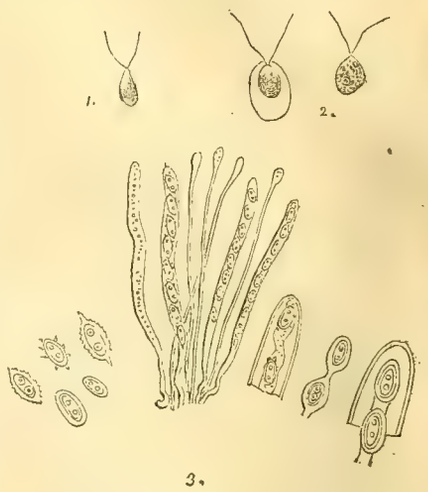

Fig. 1. Zoospore of *Cladophora glomerata*. Fig. 2. Two zoospores of Protococcus pluvialis. Fig. 3. Asci and sporidia of *Peziza aurantia*, in different stages of growth. The outer coat, which is ultimately rough, with projecting points, is quite distinct from the lining membrane, which seems to be analogous to the primordial membrane in ordinary cells.

some choice, to whatever cause it may be due, in the selection of particular spots with a view to their ultimate attachment, as, for instance, the sunny or shaded side of the vessel in which they are contained. There can be no doubt, however, that the most striking characteristic of the vegetable world is the absence of everything like voluntary action. As regards higher powers of sensation and consciousness there can be no question, except in the reveries of poets.

6. It has indeed been suggested that such beings are, during a certain portion of their existence, endowed with animal life, and that when this ceases, on their becoming attached, vegetable life commences; but this is merely saying, in other words, that during a portion of their existence they exhibit phenomena supposed to be peculiar to animals, and during the remainder those which are characteristic of vegetables; for we are utterly ignorant of what animal and vegetable life are, and only judge of them from the phenomena which they exhibit.

7. The simplest form under which vegetables can exist in accordance with our definition (No. 4) is that of cells reproducing the species either by division into similar cells, or the organisation of the matter which they contain. A mere amorphous gelatinous mass giving rise successively to new generations of cells without any reproduction from the cells themselves does not come within our notion of a vegetable, nor do we believe that such beings exist in the vegetable kingdom. The discoveries of Mr. Thwaites and others have shown that some of the lower Algals which might seem to indicate something of the kind are in reality complicated bodies, and the structure of others is at present very imperfectly known, from the great difficulty attending the examination of bodies so flaccid as to make it almost impossible to obtain a thin section. The existence, therefore, of what certain German writers call "urschlein," meaning thereby an amorphous gelatinous matter which is

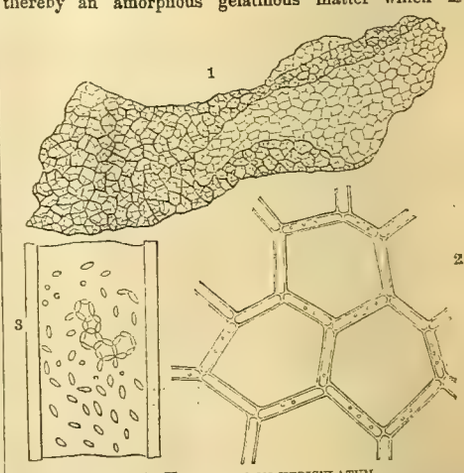

Fig. 1. HYDRODICTYON UTRICULATUM.
Fig. 2. Portion of full-grown plant.
Fig. 3 Portion of a joint in which the spores have commenced to dispose themselves in pentagons, the rudiments of the new plants.

capable of being organised into different vegetables according to the prevalence of certain atmospheric conditions, is inconsistent with this notion, and it is highly gratifying to observe that the cognate doctrine of spontaneous generation is losing ground daily amongst their more enlightened observers, and confined principally to the lecture-rooms of young professors, who for private

ends affect that form of scepticism, which may be supposed attractive to ardent but uninformed students.

8. The cases are comparatively rare in which the contents of an individual cell are organised into a multitude of new cells, without any distinct or definite division, which on the rupture of the parent cell become a multitude of new individuals, exhibiting all the peculiarities of the parent. The number of such instances is daily decreasing under more perfect observation. The structure, for instance, of *Protococcus nivalis*, the red snow of the Arctic voyagers, which has been a favourite example, is now ascertained to be far more complicated, though, in some cases, such a mode of reproduction seems to obtain. There is, however, *à priori*, great probability of the existence of such organisms, from the analogy of the production of cells without division in the asci of Truffles, and many other fungals.* A near approach to it takes place in the reproduction of *Hydrodictyon*, in which the individual cells, generated without division in the grumous contents (protoplasm) of the parent cells, become new plants merely by apposition and extension. *M. J. B.*

BARBAROSSA GRAPES.

The following is from the "Ampelographie Universelle," by Count Odart :—

Family or Tribe—Barbaroux.

	(Barbarossa, of the Italians.)
Uva Barbarossa	(Piedmont.)
Rossea	(Of Nice, according to Dr. Fodéré.)
Brizzola	(Vineyards of Liguria.)
Barbaroux	(Provence.)

This Vine, if not the most remarkable, is, at least, one of the most esteemed in the South of France, where it is extensively cultivated, as it is likewise in Italy. Its fruit is valuable as a table Grape, on account of its good flavour, fine colour, and long keeping ; and it is also an excellent wine Grape. The author of the "Cours Complet d'Agriculture" for the South of France, thus expresses the value of the Grape for wine making :—"The Barbaroux gives a light wine, brisk, and of good flavour ; the Vine is also very productive." In the "Pomona Italiana," the merits of this Vine are given in still higher terms :—"It yields a wine which is light, agreeable, refreshing, and is even spirituous in the same year in which it is made ; but in order that it may possess all these qualities it is necessary that the Grapes be well ripened." The author adds :—"It is the king of table Grapes ; in it is combined all that is excellent in the most esteemed Grapes ; for this purpose none can be compared with the Barbarossa, neither the *Uva regina* and the *Santo Colombano* of the Tuscans, nor the *Paradisa* of Bologna, nor the *Pizzutello* and the *Galetta* of the Italians, nor the *Verdepola* of the Genoese, nor the *Cattanalesca* of the Neapolitans, nor the Chasselas of the French." I do not, however, agree on this point with the opinion of the author of the work just quoted ; and he himself has, I believe, stated that the Barbarossa is not equal to the *Vennentino* of the Genoese, and *Vermentino* of Corsica; and with regard to our Chasselas (Royal Muscadine) it is much superior, in Touraine, to the Barbarossa, which does not acquire in our climate that sugary quality which distinguishes the Chasselas.

The leaves of the true Barbarossa are larger than those of the *Grec rouge*, to which the name of Barbaroux is often applied in the south ; they are also woolly beneath, whilst those of the *Grec* have only some hairs on the ribs. The bunches of the Barbarossa are middle-sized, suspended by a long and slender stalk ; the berries are somewhat oblong, becoming almost round at their maturity.

Although Micheli Trinci, an Italian writer on the Vine, has said—"*Acinis roseo colore fulgentibus*," yet the red colour of the Barbarossa is not at all brilliant, for the skin of the berry is covered with a bloom which obscures the brightness of the red.

Cels, in his notes, "Théâtre d'Agriculture," places, erroneously, the Marocain as a synonyme to the Barbarossa; but they are totally different, the Marocain having black oblong berries.

[From the above it is evident that the Grape described as the true Barbarossa by the Count Odart, is not the Black Barbarossa cultivated in this country; the latter is unquestionably a black Grape, whereas the other, according to the description, is decidedly red or rose-coloured.] *R. T.*

WOODS AND PLANTATIONS.—No. I.

The age in which we live is, without doubt, one of great progress as relates generally to those arts upon which our existence depends, and it is still more remarkable for its refinement in all that bears upon the luxuries of life. As the soundest rules have their exceptions, so the art of arboriculture must not be included in this promise, but be regarded as a branch of knowledge which has not advanced in a ratio proportionate to others of a cultural description.

Instead of sylvan nature being assisted by the hand of man, she is too often left to struggle by herself, or her fair works mutilated and marred by the empiricism of those from whom better things might have been expected. While agriculture and horticulture have advanced with gigantic strides, and the altars of Flora, Pomona, and Ceres have not been wanting for offerings or zealous priests, the temple of Sylvanus is deserted ; the incense burns not for him, and ruthless are his ministers. To speak plainly, the management of woods and mixed plantations (as would be testified by a journey in any direction) is of the most unsatisfactory kind, arising partly from the want of information on the part of proprietors, but mainly from deficient knowledge on the part of those who manage for them ; rare is it, indeed, that such persons have any notion of the laws which regulate the development of the vegetable fabric.

We live in days when statistics are very fashionable, and ponderous volumes of information are supplied upon almost every subject; not the least curious and startling would be one which would show in figures the losses sustained by the gentlemen of England in different districts by mismanagement, under the following heads: —Inadaptation of trees to soil and situation, deficient drainage, injury from excess of hares and rabbits, neglect of pruning, untimely and excessive thinning, and total neglect (a heavy item) ; certain it is that by reason of long courses of neglect, the value of wood is so much lessened that gentlemen think it not worth a trifling annual outlay. There has, most unfortunately too, been a dearth of literature bearing on this topic, if we except the valuable compilations of Loudon, in the "Arboretum Britannicum," a work too expensive for general purposes. The best work that I am acquainted with in a popular and practical form is that of Mr. Brown, of Arniston, a first-rate authority on such subjects; his book should be read by every landed proprietor, and well would it be if his advice were to be followed.

As population increases and civilisation progresses, all countries become cleared of their woods, and some of those from which our largest supplies of timber have been drawn in past years are now becoming denuded ; and, with the present ratio of emigration, each new country will, in a few years, become so. When we regard the portentous events which seem to be "looming in the future," it appears to me that this is a fit juncture to endeavour to arouse the gentlemen of this country to a sense of the vastly improvable nature of woodland property under good management. The improvements of agriculture, as exemplified in model farms, have of late years much lessened the quantity of hedge-row timber, which, although injured generally by the lopping of the farmer, afforded at least a large supply for common purposes and fuel—frequently saving timber of greater value. Undoubtedly the removal of large trees from hedge-rows is a great benefit to the fence, and also to the crop, which is much deteriorated by the shade, the drip, and the all-absorbing masses of roots which are emitted from the Ash, Elm, Beech, &c. Whenever a practice, be it a sensible one or otherwise, becomes a fashion, it is too frequently carried to excess. It is perhaps questionable if this has not become too much of a mania, if compensation is not speedily made by forming new plantations, where they may give shelter and produce ornamental effects without being prejudicial.

I would the more urge attention to this compensatory planting, because upon all estates there is some tract of inferior land, be it exposed, bleak, hungry, or wet, which if planted with suitable trees, after being intersected by open drains, might be made to supply the place of the trees removed to improve the fields, and at the same time embellish the landscape, ameliorate the climate, reimburse the proprietor in a few years, and conduce to the general welfare. Let, then, every proprietor remember that it is a duty which he owes to posterity to plant, as well as cut down, for his own advantage.

"Uno avulso non deficiat alter."

That acute observer and far-sighted man, John Evelyn, writing "a discourse on forest trees," in the year 1670, says, "For it has not been the late increase of shipping alone, the multiplication of glass works, iron furnaces, and the like, from which the 'impolitick' diminution of our timber trees has proceeded, but from the disproportionate spreading of tillage, caused through the prodigious havoc made by such as lately professing themselves against root and branch (either to be reimbursed of their holy purchases, or in some other sordid respect) were tempted not only to fell and cut down, but utterly to grub up, demolish, and raze, as it were, all these many goodly woods and forests, which our more prudent ancestors left standing for the ornament and service of their country, and this devastation is now become so epidemical that unless some favourable expedient offer itself, and a way be seriously and speedily resolved upon for the future repair of this intolerable defect, one of the most glorious and considerable bulwarks of this nation will in a short time be totally wanting to it."

If there was cause for Evelyn's alarm, how much more reason is there now two centuries have nearly elapsed, and England's resources for timber are almost annihilated, and still annihilating. Surely it behoves us to think of these things.

Although present proprietors are gainers by the increased value of their cereal crops where their hedge-row timber has been cut down, there is in such cases always a bleak and barren appearance about these tracts of ground which does not harmonise with our notions of the picturesque nature of English home scenery. It is, however, quite possible, I think, to make a compromise between the *utile* of the agriculturist and the *dulce* of the proprietor of taste, by such an arrangement as that suggested by Mr. Barron in his "Winter Garden ;" where he proposes to plant the angles of fields for shelter and landscape effect. Or if the suggestion of introducing masses of wood upon the poorest portions of estates were carried into effect, there would, I think, be less fritter, and the principle of open breadth, contrasted with such woods, would improve the general appearance of a district.

Having thus briefly glanced at the diminution of wood consequent upon the increasing demand of a large population, daily increasing, it remains for me to offer a few remarks upon the different modes of managing woods and mixed plantations, pointing out some of the most popular errors, and suggesting means of timely prevention, rather than prescriptions for what is totally irremediable, viz., early neglect. *Henry Bailey, C.M.H.S., Nuneham, Oxford.*

* The common Truffle and the large dunghill Peziza (*P. vesiculosa*) are excellent subjects of examination. The formation of the sporidia may be easily traced, in either, from the first appearance of the cytoblasts in the protoplasm of the asci, and the sporidia of the Truffle having a complicated cellular coat, afford additional opportunities of observation. Excellent figures will be found in Tulasne's large work on Truffles, and in Corda's "Icones." In cases where the number of cells produced in the protoplasm, as in *Hydrodictyon*, is very large, and the nuclei indistinct, the formation cannot be traced with the same facility, if at all.

CYPRIPEDIUM INSIGNE AND VENUSTUM.

Although it is not my intention to meddle much with Orchids, yet these two Lady's Slippers are plants, comparatively speaking, of such a hardy character and easy culture, and withal so interesting when in bloom, that I cannot help introducing them to the notice of your readers, more especially such as have only limited accommodation for growing plants. The soil in which I have found them to succeed best has been three parts good peat and one part good turfy loam, broken up roughly, and mixed liberally with silver sand; potsherds broken small and charcoal dust may also be intermixed with advantage, in order to keep the materials open. In potting, care must be taken to secure good drainage, by means of plenty of potsherds in the bottoms of the pots, covering them with a layer of dry moss.

Propagation is effected by division, *i. e.*, by parting the plant into as many pieces as have roots attached to them. Pot in the first instance in 5-inch pots, and plunge the plants in a pit, where a gentle bottom-heat and a warm moist atmosphere can be kept up; the temperature may rise to 70° or even 80° with advantage. Shade in bright sunshine, and the plants will soon establish themselves and make rapid progress. Give a shift into 6-inch pots as soon as it is found that the roots have penetrated through the ball of earth. Remove the plants into their former position for a short time, after which they may be removed to some warm part of the greenhouse. Give water as it may be found necessary until the approach of winter, when it should be gradually withheld, in order to induce a state of rest. Soon after they have begun to grow again, flowers will begin to make their appearance. The plants may then be moved to the conservatory or show-house, where, if the atmosphere is congenial as regards heat and moisture, they will bloom in perfection over a period of at least two months.

Should large specimens be wanted, the plants after flowering may be repotted into larger pots, using the same materials for compost as before. Place them again in a gentle bottom-heat, and secure a moderately high atmospheric temperature. In bright weather, shade whenever necessary, and syringe daily to secure a moist growing medium. When growth is again completed, remove them to the greenhouse, and rest them ; fine large plants will now be formed, which will bloom profusely the following season. Pursue this treatment until you have got plants large enough, when the use of pits and bottom-heat may be altogether dispensed with, as C. venustum, with its black blotched leaves, and C. insigne are, as I have said, very hardy, and will succeed and bloom freely in a common greenhouse. *Alpha.*

Home Correspondence.

Rendle's Price Current.—We think it a pity that our friends Messrs. Rendle and Co., after going to so much expense, did not get up a more handy and a more readable catalogue. It is almost as difficult to consult as "Bradshaw's Guide." What ordinary gardener would not get perplexed with 46 varieties (?) of Peas, 30 of Broccoli, 14 of Beet, 34 of Cabbage, 12 of Carrots, 15 of Celery, 38 of Lettuce, 7 of Parsley, 18 of Turnip ? Even the "description" will hardly help one to a selection. Take Turnips, for instance; who is to know which is white and which is yellow ? And what is the difference between "Golden Globe," "Orange Jelly," and "Robertson's Golden Ball ?" And is the country to be bothered with such a new name as "Chirk Castle Black Stone ?" Why, the Black Stone was in seed catalogues years ago. *W. Drummond and Son, Stirling.*

Aëration of Plant Houses.—Permit me to explain somewhat further the principle of the ventilator put in my plant-house, a short account of which appeared at p. 38 of your last Paper. I find by some who have seen it that its mode of action is entirely misunderstood. In Mr. Tomlinson's Treatise on Warming and Ventilating (Weale's series) at pp. 83 and 163 ; and also in Mr. Hood's book, the matter is fully explained. Mr. T. says : "The same cause which produces the draught in a common chimney, also in the glasses of lamps, will set in motion and discharge the vitiated air of our rooms, at the same time that it brings in the fresh." Now air, by being heated, expands one part in 480 for every degree of heat acquired. The air in a chimney shaft 10 feet high, 20° hotter than the external air, expands $\frac{20}{480}$ = 1-24th part of its bulk — in this case this =6 inches. The weight of the air therein is so far lessened that it will require 10½ feet of this warm air to balance a column of the external air 10 feet high ; the rate of efflux—ascentional force—draught will be equal

to the velocity of a heavy body falling through the difference of height of the two columns. This velocity converted into terms for 1 minute may be thus written : $\sqrt{480 \times h \times d}$, where h equals height of shaft, and d = degrees of difference of temperature. (In words, the square root of the product of 480 × height × degrees of difference). This velocity multiplied by area of opening will give the number of cubic feet discharged per minute. It is absolutely necessary that the inlet openings should be as large as the outlets. The areas of my inlet and outlet channels are each 3 square feet. The vertical height of the short or outlet side is 1 foot ; and applying the above rule for calculating the efflux, the quantity of air let out and admitted is for differences as below :

10° dif.	A rate of efflux and inflow of	69	feet per minute.	multiplied by area of openings.	=207	Cubic feet discharged per minute
20° ,,		98			=294	
30° ,,		119.5			=358	
40° ,,		138			=414	

The cubic content of my house being nearly 1800 cubic feet, it follows that the whole air is changed 7, 10, 12 and 14 times per hour respectively. Now a wind at two miles per hour is not very perceptible, but the motion of the air in a house thus ventilated, even at the greatest difference of temperatures likely to occur, would not exceed that ; none of these equal it ; a difference of 65° would produce such a motion ; but whether a gardener wants his house to be at 97° when the external air is 32°, I must leave. I conceive it is this very gentle motion of the air in my house, and its complete independence of all lateral draughts, and the uninterrupted inlet to the dews of night, which has so renovated and freshened my plants. I admit they are of no great value, but they please me, and the same treat I give them would suit their more costly relatives ; and I beg to submit that the same kind of attention to our needs would very materially increase our comfort in very many places of public assembly. If the principle be true it will apply as well to the Crystal Palace as to my small greenhouse. *J. P. S., Chesterford, Jan.* 24.

Guano not wholly excrement of Birds.—Seven years ago I put away in a tin box some brown and white Mustard seed which had been pounded in a mortar ; the box was lately opened, the contents were decomposed to a reddish brown substance exactly like Peruvian guano, and very strongly impregnated with ammonia ; this leads me to think that the guano we get from Peru is not wholly the excrement of birds, but partly decomposed vegetable matter. *T. G., Mile End, Feb.* 1.

Planting Woods.—Next in order to drainage and selection of plants, as spoken of in my last article, comes planting, an operation generally run over and done in a careless manner, and when such is the case it is impossible that good results can be expected. It may be done in less time, and of course at less expense ; but the unprofitable returns are never considered, all that is cared for at the time is little outlay. The most modern and best method of planting Oak and Larch on sheltered situations is to have them put in at about 4 feet over all, the Oaks at 10 feet, and the rest filled up with Larch. Pits are made for the former in all cases, and the latter are generally put in with what is termed notches ; when the plants are small this may be done, yet when they are comparatively large, pits are necessary, as in most cases when notches are used the soil can never be made so firm as to prevent danger, for it is always a great essential to have the earth made firm and close around their stems. For the notching system an instrument has been invented by an able forester (Mr. M'Corquodale, Perth) ; the difference between it and the spade commonly used for that purpose is its having a protuberance from its centre of about 3 inches in breadth and 6 inches in length, or in other words, a spade standing at right angles to the breadth of another spade. By this construction only one insertion is required, consequently a saving of time is effected ; whereas by the old mode two insertions are required. I gather from the last published Blue-book of the Woods and Forests that the system of planting Oaks and Scotch Pines (the latter tree being excessively used there as a nurse) is to plant the Oaks in lines 8 feet apart line from line, and 4 feet plant from plant in the lines ; then Scotch Pines are put between these rows, also 4 feet asunder in the lines, and 4 feet from the Oaks on either side respectively, thus making alternate rows of Oaks and Scotch Pine, and the whole 4 feet over all. Now, the most unassuming forester will at once perceive that such is wholly contrary to the attainment of beneficial results, without the excessive employment of Scotch Pines as nurses, for how can any thinning be made with regularity ? When the lines of Oaks are 8 feet apart, and the plants only 4 feet asunder in the lines, how can such thinning be done to perfection, as their future health demands ? Or how can the Scotch Pines nurse or be thinned as required, without the risk of undue exposure ? Although it would appear that the system adopted in the Royal forests in such cases is to take away the entire lines of Scotch Pines at first, without ever removing an Oak ; such practices as these at once point out to what is to be ascribed the comparative inferiority of these woodlands; whereas, with a view to their future health, every other Oak and Scotch Pine should have been removed, afterwards gradually clearing off the latter as they were found to interfere with the permanent crop. *W. B. A.*

Weather in Dorsetshire.—The following is a register of maximum cold for one month at Abbotsbury. You will observe that with the exception of two remarkable nights, December 28 and 29, the general proportion is from 1° to 3° or 4° higher than this place (Melbury). The difference during the day, of which I have no report, is, I know, generally greater in proportion. The lowest degree at each place was on different nights; the lowest here 10°, being the night after that at Abbotsbury 15°. The night of January 3, which seems to have been the coldest in the country, was only 19° and 20° respectively between two comparatively mild nights, which shows it must have been the tail of the great inland depression of temperature. As I have not been to Abbotsbury, I cannot tell what the effect on vegetation has been.

June	4.45	16		50.86	195
July	7.54	28			

Average fall for 11 years, 58.00 inches.

January 10. Missel thrush singing.
„ 20. Nearly 3 inches rain fell in 12 hours !
March 5. Curlew and pewitt returned to their summer haunts.
„ 19. Thermometer 16° at 6 A.M.
„ 26. Thermometer 20° at 6 A.M.
April 20. Swallow seen.
„ 21. Cuckoo heard.
May 8. Distant hills covered with snow.
„ 18. Corn-craik heard.
„ 31. Hoar frost for several mornings past.
December 10. Thermometer 10°.
1854.—January 3. Thermometer 4° during the night ; 12° at noon.
„ 21. Short but severe thunder-storm.

J. Little, Carlesgill, near Langholm, N.B.

New Grapes.—I beg to thank Messrs. Warde, Cooper, and "R. T.," for the information they have afforded respecting the Barbarossa Grape, which, although not so explicit as might be desired, has yet added something to our previous knowledge of the origin of this variety. It is much to be regretted, however, that Mr. Warde did not cause his introductions to be fruited, and their quality fairly ascertained by comparison with the best sorts grown in this country ; we might then have known whether any and which of them merited cultivation, and also have ascertained which were distinct from and which identical with previously introduced varieties. New kinds of fruit might just as well be suffered to "waste their sweetness" where they grow as to be brought, not without considerable trouble and cost, to this country, and then suffered to perish unknown and uncared for. Some of Mr. Warde's Grapes may have been new, and, possibly, valuable varieties ; although, so far as Italy is concerned, I am disposed to think that very few really good table Grapes exist which have not at some time or other found their way to England, and it is not unlikely that those called by Mr. Warde Alicante, Damasco nero, and Zibibbo, are identical with our Black Prince, Black Damascus, and Muscat of Alexandria. Two varieties were brought from Italy a few years since by a gentleman, who considered them the best Grapes he had met with in his travels in that country, and through his liberality I had an opportunity of fruiting them in a Vinery ; one proved to be a small oval-berried white sort, not altogether without merit, although certainly inferior to the White Muscadine ; the other, a small black kind, was utterly worthless as a dessert Grape. I have also fruited a sort brought by another gentleman from the vicinity of Pompeii, which proved to be a wine Grape of no value whatever for the table ; so that the only newly introduced Grapes which have ever come under my notice might, without any loss to this country, have remained in Italy. There may, however, still be in that and other wine-producing countries some few new and first-class table Grapes which it would be desirable to introduce into our Vineries, but a considerable amount of discrimination ought to be exercised in making the selection. Whether the variety now under discussion is distinct from any other known sort, has not yet, I think, been proved beyond the possibility of question. Mr. Cooper considers it new, although I must say that according to his description of the Barbarossa it is ominously like a Grape I knew many years ago under the name of Black Muscadel. Mr. Cooper also speaks positively of four distinct Grapes of this class besides the Barbarossa, namely, the Wortley Hall, Poonah, or Eschcolata superba, Black Muscadel, and Black Raisin, in which opinion I cannot concur. If this should meet the eye of the present gardener at Bicton Castle, it might induce him to assist in clearing up this point by forwarding a bunch of each of the three latter, together with the respective shoots and leaves, to the office of the Horticultural Society, 21, Regent Street. Possibly also the gardener at Thorp Perrow may be able to throw some light on the subject, if Money's Grape is still in existence there. As to the Black Morocco, it is altogether a different thing. I see the Trebiana is described in Rivers's Fruit Catalogue. Has Mr. R. ever seen the fruit ? *J. B. W.*

Libocedrus chilensis.—Admirers of hardy Conifers are certainly much indebted to Messrs. Low, of Clapton, for the valuable information which they have given in their catalogue respecting the natural habits and peculiar characteristics of this particular species. The description just referred to will be found to embody all that is really necessary for the successful treatment of this beautiful plant. That information of this kind is needed, may be gathered from the fact that, without any previous preparation in the way of drainage, amateurs often commit the roots of new Conifers to the ground, planting them as they would common evergreen shrubs. Trees thus treated, however, rarely and indeed can scarcely be expected to succeed ; their lower branches soon show traces of premature decay, and the whole plant not unfrequently becomes discoloured. The Cryptomeria, for instance, when in this condition, is so unsightly as to render its presence in the arboretum anything but desirable. The same remarks also apply to other Conifers. Before planting it is always necessary to drain the ground, so as to prevent the trees becoming stunted, and to keep the roots in healthy action ; for it is to the roots that the amateur planter must look. Let him make the bottom all right, and all above ground will take care of itself. The different varieties of Conifer, including the Chilian Libocedrus itself, if treated in this way, cannot fail to thrive ; and, except these conditions are secured, any and every attempt at cultivating the more valuable varieties, will for all ornamental and useful purposes, be only so much labour lost. These plants will, however, be found to thrive even in the most exposed situations, provided their drainage necessities are properly attended to. *R. Miles, Hassock's Gate Nursery, Sussex, Jan.* 17.

Large Himalayan Conifer.—In 1852, when travelling up the Ganges in the Himalaya Mountains, about two days' march from the junction of the Jhanaire River with the Ganges, on the pass of Cupper Ghati, about 300 feet immediately above the river, I was struck with a species of Pine which I have never heard described till I met with your Wellingtonia gigantea, and I would like to know if my description identifies the same tree. It grew upon the dry rock, a perfect cylinder, from 150 to 200 feet high, 7 feet in diameter at the base, and tapering to the top ; it had no large limbs, but was covered with drooping branches, whose leaves were between the cordage of the Himalayan Cypress and the Arbor-vitæ. They were the largest and soundest trees I have ever seen. One of them had fallen, and was lying below in the bed of the river Ganges, having carried many tons of rock with it attached to its roots. Its head extended into the bank on the side on which it had grown, and it enabled me to pace its stem to where its roots lay in the river. My companion and I computed it to be 160 feet long and 7 feet in diameter at the root. There was a group of about seven larger ones standing together on the top of the ghaut. The same species of tree, though an inferior kind, is described by the doctor who accompanied the Prince of Prussia, whose book I read with great interest, hoping to find that in his route he would fall in with my tree, but he unfortunately avoided Cupper Ghati, and missed seeing this magnificent tree, which grew at about 12,000 feet above the level of the sea. *D. H. M'D., Garthland, Lochwinnoch.* [It is superfluous to say that this tree, whatever it was, had nothing in common with Wellingtonia.]

Cottagers. — When coals and bread are scarce and dear, it may be doubted whether it be good policy to furnish the poor with these articles at anything under their market price, or, still worse, gratuitously. Most true it is, that in times of dearth assistance is due to those whose wages will not procure the necessaries of life, as well as to the pauper ; yet in measures taken for their relief, it should be borne in mind that a diminution in the consumption of articles that are dear, tends to a reduction of their price. Now, it is well known, that both rich and poor are regardless of waste when things are obtained at little or no cost, and consequently persons who can obtain bread and coals gratuitously are little likely to be sparing in their use; considering this, it would appear to be a wiser measure to assist the poor by other means than that of giving them either bread or coals for nothing, or at a price below that at which these articles are obtainable in the market. In the way of example, it might be suggested to charitable persons that their donations should be—not bread or coals—but of hot boiled Rice ; it is an article which the columns of the *Gardeners' Chronicle* truly say is appreciated by the cottager, and it is already considerably used by both rich and poor. The serving of well boiled Rice instead of bread would much diminish the consumption of flour ; so coals might be saved by this means, since fewer of them are required for boiling Rice than for baking bread. This mention of Rice in particular is intended merely as a hint—a hint to the benevolently disposed that they should consider what effects their charity is likely to produce, at the same time that their bounty relieves distress. *B.*

How to make Wood look old.—Many persons, if not all, object to the raw appearance of ornamental buildings in a garden, and for this reason use so much rough

cch, &c. But rough wood ought never to be in oximity to regular buildings, being unarchitectural d inconsistent; but if any wood is washed with a weak lution of sulphuric acid and water it will take the sky look and grained appearance of older wood, at e same time it may be squared and wrought to suit y architectural style. Paint never looks rural, still ss picturesque, and is always a source of yearly exation and expense. If the wood is dry at heart this ill preserve it longer than paint. *Constant Reader.*

New Patent Application of Gas for Heating Purposes.—I wish to explain that in this plan the atmospheric air is not taken from the building, but that it is obtained from a cold air drain outside, where the gas is also burned. The effect inside the house, pit, or frame, is therefore precisely that of hot water. The air may be either dry or damp, and any degree of heat may be maintained merely by an increase of gas. The general appearance of the fittings is that of hot water without the furnaces, and, the materials being of a lighter character, the first cost is about one-half that of hot-water, and the expense of consumption afterwards about one-fourth. The saving of time, the cleanliness, and certainty of no failure arising from negligence, are also advantages, to which may be added the rapidity with which the heat can be got up in the house. I therefore hope that the contrivance may meet with approval. *R. Restell*, 35, *High Street, Croydon, Jan.* 18.

Notices of Books.

Aslit's Decimal Coinage; with a Proposal for Decimalising our Weights and Measures of Length and Capacity.

This shows, by various explanations and examples, how easily sums of money, expressed in terms of a decimal system, may be added, subtracted, multiplied and divided, compared with the system now in use. This of course is well known to every one acquainted with decimal arithmetic. The work is illustrated with a plate representing the coins which the author proposes should be struck, in order to carry out most conveniently the system. On one side of these the value is distinctly marked with the name and relative values, as has been done in the case of the florin, but more conspicuously. These proposed coins consist of—

Gold.....1 pound, value	...	...	...	1000 mils.
,, ...5 florins ,,	...	...	...	500 ,,
Silver ...1 florin ,,	...	...	...	100 ,,
,, ...5 cents. ,,	...	...	...	50 ,,
,, ...2 cents. ,,	...	...	...	20 ,,
,, ...1 cent. ,,	...	...	...	10 ,,
Copper...5 mils. ,,	...	...	...	5 ,,
,, ...1 mil. ,,	...	...	...	1 ,,

In a system purely decimal, the respective denominations in conformity with it must increase or decrease in relative value by tens. In the above proposed coinage, however, it will be observed that such is not the case. It is evidently a mixed system; for we have a piece of the value of 1000 mils and another of *half* that value, or 500 mils; another of 20, its *half* of 10, and its *quarter* of 5 mils. Thus we find ourselves, at the very outset, on the fair way of getting into the old system of halves and quarters instead of proceeding in a decimal ratio; and if such be the case at the beginning what may we expect in the long run? Certainly no strict adhesion to a decimal system; for although this may be enforced so far as regards accounts and government affairs, yet the mass of the people will naturally employ that system which is practically the best and most convenient for them. For proof of this we have only to turn to France, or Belgium, or to the United States of America; in the latter particularly, after half a century, the decimal system is becoming every year more and more a nullity. They have their double eagle, eagle, half eagle, quarter eagle, dollar, half and quarter dollar, dimes and half dimes. Cents appear only to exist on paper; and on this, of course, the decimal system excels all others.

With regard to the proposal for decimal weights and measures, the same tendency to follow the halving system will operate probably still more against it than in the case of money. In practice, the division of quantities by 2 is more required than by any other number. The decimal weights and measures of capacity in France are allowed, by law, to have each its double and its half. We have long been of opinion, in accordance with that of the author, that the foot, as derived from the standard yard, is a measure that cannot be advantageously interfered with; and decimal measures of capacity will not, we think, prove so convenient as many anticipate. We should, however, recommend those interested in the matter to read the little work, and then they will be able to form an opinion of the merits of the proposed innovation.

New Plants.

42. Nycterinia selaginoides. *Bentham; aliàs* Erinus selaginoides, *Thunberg.*

A very pretty greenhouse annual, received from Messrs. Vilmorin & Co., under the erroneous name of N. villosa. It forms a broad spreading patch of pale dull green hairy herbage, arranged in the manner of a Candytuft. The leaves are linear-spathulate, and slightly toothed; the uppermost quite entire and adnate to the tube of the calyx, than which they are much longer. The flowers are arranged much in the same manner as in Iberis, forming a true corymb. They are pure white except the eye, which is a very deep-yellow cup fringed by an exquisitely beautiful coronet of tiny yellow hairs. The tube of the corolla is very slender, an inch long, and nearly smooth; the limb is flat, a little curved backwards, with five two-lobed equal divisions. This may be regarded as one of the prettiest summer annuals introduced for some years. *Journal of Hort. Society; Vol. IX.*

43. Didymocarpus Humboldtiana, *Gardner, B.M.* 4757.

A hothouse or warm greenhouse plant from Ceylon, introduced at the Royal Botanic Garden, Kew, from seeds, communicated by Mr. Thwaites. It is something in the way of Streptocarpus Rexii, or Chirita sinensis, with pale lilac campanulate flowers. It is scarcely handsome enough for general cultivation.

44. Ceropegia Thwaitesi, *W. J. Hooker, B. M.* 4758.

A stove climbing plant from Ceylon, with small ovate leaves, and long curved green flowers spotted with crimson; the latter are singularly like those of some Aristolochias. Of no horticultural interest.

Garden Memoranda.

Horticultural Society's Garden, Turnham Green.—The ill effects of the severe weather we have experienced this winter are already becoming visible. Pinus patula, Russelliana, and Devoniana have had their foliage very much browned, even so much that it is doubtful whether all of them will recover. P. Lindleyana is a little touched on the north side, but scarcely if at all on the south, and trees of it in some places have escaped altogether unhurt. P. macrophylla has had the ends of the leaves browned; Taxodium sempervirens is as green and healthy looking as if it had had no severe weather to contend with, as are also Cryptomeria japonica, and Cupressus thurifera and Uhdeana; Pinus apulcensis has been injured a good deal. Pinus ayacahuite has been hurt a little, leiophylla considerably, and Hartwegi has also suffered to some extent. A. Brunoniana appears to be quite dead, and Saxe-Gothæa conspicua has been injured apparently beyond recovery; Fitzroya patagonica has stood much better and looks as if it would maintain the hardy character it has received.

In the American garden the Sikkim Rhododendrons, Edgeworthi, Dalhousiæ, and glaucum, have all been killed, while ciliatum and the large variety of it called alpinum, have stood well, not a leaf being browned, and they are at present well set with flower-buds. The long hard leaves of the Pampas Grass have lost their colour, and look bleached by the frost The Californian evergreen Cherry is scarcely at all touched; and the same may be said of Ilex latifolia, which has stood well. The Yucca-like Dracæna indivisa has lost its top, the latter, as far as the leaves were young and tender, having melted as it were away by the frost. Quercus Cooki, Garrya macrophylla, and the Chinese Privet, have all had their leaves browned, while the Chusan Palm has escaped uninjured. The beautiful evergreen Californian Gale (Myrica Californica) has proved itself to be perfectly hardy, not a leaf on it being browned; Escallonia macrantha has been a good deal injured. On the conservative wall Acacia melanoxylon has been killed nearly down to the ground, various Ceanothes have had their leaves browned and some other things have been more or less hurt; but upon the whole less mischief has been done here than might have been expected. Jasminum nudiflorum is now in full blossom on this wall, its bright yellow flowers having a very cheerful effect. The different kinds of Chimonanthus are also in flower at present, and are great favourites, no account of their delicious fragrance.

In the large conservatory Acacia Riceana, quite a tree in size, is now coming beautifully into bloom, as are also the Camellias, more especially the large flowered sort called Elegans, which is just beginning to open multitudes of showy blossoms. The Luculia gratissima has been flowering finely; but its beauty is now nearly over. An early pink Chinese Azalea is at present in full blossom and that without any forcing.

The new brick flue mentioned in our last report as being in course of erection in the early Vinery is now completed. It is 16 inches in width and 13 inches in depth. The top is covered with common flat tiles; but under every joint a bit of thin slate has been introduced, in order the more securely to prevent smoke or other noxious exhalations from escaping. Slate is better than iron, which is sometimes employed for this purpose, as the iron is more easily affected by heat or cold.

The fruit trees in Ewing's glass walls have been pruned and trained; but it has been found necessary to keep them, more especially the Peaches, as much off the galvanised iron wire trainers as possible, for wherever the shoots happen to touch the wires, they are sure to gum and canker. This fact should, therefore, be borne in mind by all who contemplate using this kind of wire for training purposes.

In the orchard and kitchen garden department the trees on the Peach wall have been pruned, and Apples in the belts are also undergoing the same operation. Broccolies have suffered much this winter; even Cox's Late White, usually a most useful sort, has this year been destroyed. Betts' Improved has stood better than some. It very much resembles Knight's Protecting, having the twisted leaves and other peculiarities belonging to that variety.

The alterations in the Arboretum have nearly reached completion.

FLORICULTURE.

Treatment of Tree Carnations.—Few plants have more improved of late years, both in habit of growth, variety and richness of colours, than Tree Carnations, and they amply repay the attention that has been bestowed on them, for they are not only beautiful but very fragrant, and with little care they may be had in flower at almost any season; in fact, if a sufficient quantity of plants is prepared, a succession of bloom may be obtained from them the whole year round; I trust, therefore, that we shall shortly see them very extensively cultivated. They are easily propagated by cuttings, which should be made of half-ripened wood, like the show varieties, cutting them close off below a joint and removing the lower leaves. March or April will be found the best months for putting in a stock for winter blooming, as they will make excellent plants during summer and autumn. Although they strike readily nearly all the year round if placed in a slight bottom-heat, the most healthy of the old plants should be selected and placed in a warm temperature to excite growth prior to the cuttings being taken off. By following this plan they will be found to strike more freely. The pots should be thoroughly drained for their reception, and a portion of rough sittings or moss placed over the crocks. The compost should consist of one-half light sandy soil and one-half leaf-mould and sand run through a fine sieve and well mixed together. With this the pots should be filled to within about half an inch of the top, the remainder being made up with sharp sand pressed firmly and slightly watered before the cuttings are inserted. If placed in a slight bottom-heat they will not require any bell-glasses to cover them, for if only slightly shaded during sunny days they will very speedily take root. If any of the grass should decay it should be removed the moment it is perceived, as it creates damp. As soon as they have become sufficiently rooted, pot them into 4-inch pots, still keeping them in a warm moist atmosphere, and stop them, in order to form them into compact bushes. As soon as they have again filled the pots with roots, give them another liberal shift into 7-inch pots, still keeping them in a warm atmosphere, and using the syringe freely until they have got quite established, when they should be gradually hardened off, and finally placed in a cold frame, where they may remain during the summer months. Except potting, stopping the shoots, which should only be done when the wood is in a half ripe state, neatly tying the shoots as they progress, watering when required, frequently overhead, and occasionally stirring the surface-soil, nothing will be needed during the summer and autumn. I have, however, found green-fly troublesome at times, but if the water-pot is frequently used overhead but little need be feared either from them or red spider; if they happen to be attacked by mildew, apply sulphur as soon as it is perceived. When cold damp weather sets in, remove them to the greenhouse or conservatory, where they will come into bloom in succession during the whole of the dull winter months; after they have done flowering, select the most healthy cuttings—the old plants should be cut down for another year or thrown away. The stopping should always be regulated by the time when they are wanted to be in blossom,—for instance, for early winter flowering the plants should not be stopped after July, and so on; if the plants are well ripened by autumn, they may, by a little additional heat, be had in flower whenever they are required. The soil best suited for their culture is maiden loam, leaf-mould, rotten cow-dung, and silver-sand, to which may be added a portion of mortar rubbish, in order to keep the soil porous; manure-water, with occasional waterings of soot-water, will be found beneficial during the growing and blooming season. *E. B.*

Carnations and Picotees: *E.* These will now require plenty of air, as it is absolutely necessary that they should be hardened as much as possible previous to their planting out in March. We fear there has been a considerable loss in these plants this season. Amateurs will therefore see the propriety of immediately making good their deficiencies from quarters from which they have been previously well supplied.

Polyanthus: *E. S.* You should inquire for Addis's Kingfisher, a bold, finely formed, and rich red kind. We should be glad to see flowers of this style more patronised, as they contrast so well with the darker varieties.

Potting Carnations: *O E.* Early next month is the time for potting, and of course previously such varieties as are required to replace lost sorts or to add to the present stock should be procured. In selecting plants, the largest are not always the best, but frequently be ome "gouty" and die; a moderate strength, of a good clear colour and free from "spot," is the most likely to give satisfaction. There are two systems of potting practised: one is, to put three plants into a pot; and the other, to put a pair. In the latter plan they are more easily moved about, and in the former they make a greater show, often having three or four blooms open, instead of one; so on this point every one may be safely left to their choice. The soil and mode of potting are important: the soil should be a strong rich loam; the manure should be perfectly reduced to mould, and thoroughly incorporated. If your loam should not be rich enough, a portion of old cow-dung may be well mixed and rubbed into it; and if the loam has had no previous mixture of manure, two parts loam and one of old-cow-dung may be used; before using, it must be thoroughly examined, little by little, to make sure that there are no wire worms in it; for one of these pests, however small, introduced into any of the pots will ensure the destruction of the plant. Drain the pots with about three-fourths or 1 inch of drainage, and fill them with soil sufficiently high to receive the plant, and press the soil into the pot to make it firm.

Ranunculuses: *A K.* They should be got in as soon as the ground is in a fit state for their reception; 3 inches deep and 4 inches apart in the rows will be found sufficient space for them.

Tulips: *Louisa.* These ought to be covered when there is any appearance of frost.

Miscellaneous.

A Royal Forest; by One who Knows it.—Luckily it was a royal forest, for it would have ruined any one else. It had long been "administered" by Mr. Prettyfat, formerly butler to the great Lord Foliage, when that nobleman was at the head of the Woods and Forests; and 20 years had not diminished the stock of ignorance with which Prettyfat entered upon the duties of his office. He had, however, forgotten all about

"napkins," and was now a most important stately stomached personage, with royal buttons on a bright blue coat. Pinch-me-near Forest being quite a back-slum sort of place, that nobody ever wanted to see, the roads all seemed to shun it, and it was only by very vague conjectures and speculative cuts that our friends managed to steer towards it at all. Not that the forest itself was worse than any of its royal brethren; indeed, it was better than some, for Prettyfat neither stole the wood himself, nor knowingly suffered others to steal it, his being the easy do-nothing style of management, that let the trees grow if they liked, or if they didn't like, let them stand still and die, or be blown down and rot at their leisure. He made his reports regularly and fairly, and so long as he got as much money as paid his own salary and the wages of his labourers, he felt he fulfilled all the duties of a faithful servant of the Crown, and did all that a grateful nation could require.——Bump, bump, trot, trot, squash, splash, swosh, they went through the open fields, over the commons and heaths of a wet, sterile, pewitey country, which gradually got worse as they neared the stunted brushwood of the straggling forest. At length they came upon a nest of forest squatters, with their wretched mud cabins and rolling fences, by whom they were directed to a smart, well-hung green gate, with a cattle-gap on either side, as the commencement of Mr. Prettyfat's inattentions. Some well-used horse trods, converging towards a gently rising hill on the right, from whence a curl of clear smoke was now rising, favoured the supposition that the representative of royalty was not far off.——Now our friends' misfortunes commence, for the further they get from the seat of government, the worse the riding becomes. Impervious thickets, through which hounds meuse, but horses can make no way, soon separate them from the pack, whose music falls fainter and fainter on the ear; our anxious master pushes on, through the wet sterile sand, or slobby quagmires, impeded ever and anon by a fallen tree—in hopes that a favourable turn may again land him with the pack.——The forest still continued the same forlorn, unprosperous-looking place; where the wet stood, moss grey, aguish-looking trees were dying by the middle, while higher up, the Oaks battled with the briars and other smothering rubbish. Our master, however, was too busy to observe anything of the sort—all he knew was, that it was werry bad riding. The sound of the horn on the left first caused him to pause and ponder whether he was on the track of Pigg. There were footmarks, but not so fresh as his should be. Another unmistakeable twang, and Mr. Jorrocks determined to alter his course. Where all was so bad, there was nothing to choose. Accordingly he swung Artaxerxes short round, and turned him up another rushy, waterlogged track, that seemed to lead in the direction of the horn. Desperately bad the riding was. The nature of the ground seemed to change, and from hop-pole-like Ash and Alder, to be stocked with nothing but stunted Birch. The soil was black and peaty, with here and there the outline of a long-subsided drain. *Handley Cross; a clever sporting Tale.*

Calendar of Operations.

(*For the ensuing week.*)

PLANT DEPARTMENT.

CONSERVATORY, &c.—Let the greatest possible neatness prevail in the conservatory, and substitute plants in bloom from the forcing pit, for such as are becoming unsightly. Be careful to give all plants in flower a proper supply of water; Camellias and many other things will be benefited by an occasional watering with clear, weak, manure water, which, when used, should be about the same temperature as that of the house. Guard against damp by leaving a very little back air on at night, for most flowers are soon injured by moisture, and the light coloured Camellias especially are susceptible of injury from this cause. It will, however, be equally necessary in case of having to use much fire-heat to provide for a regular evaporation, so as to maintain a soft moist atmosphere; for the one extreme is nearly as injurious to the health of plants and the duration of their blossoms as the other, and both must be guarded against. Where forcing pits are used for forwarding the blooming of plants to furnish the conservatory with, see to introducing portions of such kinds as may be wanted at proper intervals, so as to secure a regular and continual supply of bloom.

FORCING DEPARTMENT.

PINERY.—Gradually increase both the temperature and humidity here, and keep up a bottom-heat of at least 80°. Early growth, with a long summer following, is all important for the production of fine fruit. Give liberal treatment to any plants showing or swelling their fruit; this is best effected by watering with weak liquid manure-water. In repotting Pines be sure to secure an open condition of soil by the use of good turfy loam, with a liberal admixture of sand and charcoal dust; for without a proper mechanical condition of soil, no great success need be expected in the production of fine fruit. Be sure to secure good drainage, and with these conditions, and the use of manure water, no fear need be entertained of perfect success with due attention to heat and moisture, points to which we shall advert in future calendars; for the present 60° by night, increased to 80° with sunheat, will be sufficient for fruiting Pines, while for successions and those required to fruit later in the season a night temperature of 56° will be ample, and this may be increased in the day to 70°. VINERIES.—See that the heat in borders of such houses as are being forced is kept steady; should it decline, apply fresh fermenting material immediately, for a check in the root action would be productive of much injury. In the case of old Vines in the earliest house—stop the shoots at two leaves above the fruit, or even three, may be retained, should the Vines be weak—this will give a sufficiency of foliage to mature the Grapes; while, in young vigorous plants, one will be sufficient to effect that purpose. Cease the use of the syringe to Vines showing fruit. The second Vinery will now be breaking. Gradually advance in night temperature from 50° to 55°; the day heat may be allowed to reach 70°, with plenty of air. Syringe the Vines daily, and otherwise keep up a moist atmosphere. Prune successive Vineries, and wash the Vines with sulphur, soft soap, lime, and soot. Wash the glass, wood work, and walls, and have everything in readiness for a start. PEACH HOUSE.—Peaches will not be hurried on with impunity from mischief. Keep a comparatively cool but steady temperature, and have a free circulation of air to facilitate the dispersion of the pollen—a night temperature of 45° will be sufficient. Ants are sometimes very destructive by eating the pistil out of the expanded flower, hence destroying the crop; should they make their appearance, tie cotton wool around the stems of the trees to stop their ascent, and also place about the house treacle, with a liberal admixture of arsenic; this will quickly destroy them.

FLOWER GARDEN AND SHRUBBERIES.

All alterations here should now be pushed forward with the greatest possible despatch, particularly the preparation of ground for planting, and complete the removal of large shrubs, &c., as soon as possible, for besides this kind of work being done with much greater safety now than in spring, it is very desirable to get it out of hand before that busy season arrives. In stiff soils the flower beds will be greatly improved by a liberal dressing of charred vegetable refuse, which should be applied when the surface of the ground is sufficiently crusted, so as to be able to turn it in without treading the soil. The beds should be trenched every second or third year to the depth of at least 2 feet, keeping the under soil, if clay or hungry gravel, in the bottom; this will be of much more importance to the health of the plants at all seasons, and more conducive to the production of blossoms, than heavy dressings of manure, which induce an over-luxuriant growth, and render the plants particularly liable to suffer from drought in summer, or from sudden changes in the weather. In situations where draining is required, it should be effected at once, making the drains at least 4 feet deep wherever that can be effected.

FLORISTS' FLOWERS.

After the very severe weather we have had, most of the stock in frames will doubtless have suffered considerably from damp, owing to the sashes having been kept close. Air should now be admitted freely, removing the lights entirely on fine days, and the entire stock gone over and carefully cleaned. Should aphides make their appearance apply tobacco-smoke without delay, giving a moderate dose, repeating it if necessary. Pinks and Carnations should be kept rather dry, many valuable varieties are lost by over-watering at this season. Auriculas should be carefully examined.

KITCHEN GARDEN AND HARDY FRUIT DEPARTMENT.

Suffer no delay in getting all ground intended for Asparagus, Seakale, and Rhubarb in readiness for planting. Sow Peas in heat to plant out in March; if sown in 60 pots, the roots are but little disturbed in planting out into the open quarters, after being sufficiently hardened off. In the event of frost after planting, protect by Spruce branches. Make a successional sowing also on a sunny border; likewise do not omit to get some early Mazagan Beans in. Look over all Strawberry beds; weed them, and remove all dead leaves and runners that are not wanted; top-dress with well-decayed manure, which may be slightly forked in. Prepare ground for Horse-radish by trenching and putting manure in the bottom of each trench, and also prepare ground on some warm border for early Potatoes. A few Early Horn Carrot and short-top Radish may now be sown in a warm border, covering, in case of frosty weather, with a little litter.

COTTAGERS' GARDEN.

A few early Potatoes may now be planted. Place them in drills about 4 inches deep, and from 15 to 18 inches apart; and if a little leaf-soil, or any other light compost, can be spared with which to cover the sets, it will greatly assist in protecting them from frost, as well as prove beneficial to the crop. Also, if not already done, plant a small breadth of early Mazagan Beans on a bit of strong soil, to furnish an early supply. Plants in pots, in the window or frame, must be very sparingly supplied with water at present; and when any is given let it be done on the morning of a mild day, so as to allow of getting the foliage, &c., dry before evening. Keep the frame well covered up at night, and during frosty days, so as to guard its inmates from injury.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Feb. 2, 1854, as observed at the Horticultural Gardens.

Satur. 11	44.5	30.3	37.4	12	0.34	7	3	1	—	5	6	2

The highest temperature during the above period occurred on the 10th 1831—therm. 65 deg.; and the lowest on the 11th, 1845—therm. 3 deg below zero.

Notices to Correspondents.

APPLES: *Solidus*. Your seedling Apple is middle sized, of a handsome Pearmain shape; skin of a rich red next the sun, interspersed with slight russet. Flesh firm, but not so brisk and rich in flavour as some others. It may do for kitchen use.‖

APPROACHES: *A Reader*. The drains which you intend putting in on either side of your old approach, where the soil is rather retentive, should certainly be filled half full with stones and the rest with gravel, in preference to covering in the tiles with the old soil.‡

AQUILEGIA: *A H*. We really cannot find such a plant. Surely A. californica must be some evanescent garden name.

BEES: *H O M*. What advice can we give you? The season has been *most* unfavourable. Our own have died. The best remedy is patience, and renewed attempts; the best book is probably "Bevan on the Honey Bee."

BOOKS: *J J B*. We fear you have a very imperfect idea of the meaning of the word botany. However, as far as we can comprehend your wants, we advise you to begin with Lindley's "School Botany," which will put your first steps right. A new edition, much enlarged, is just ready.—*J B*. Lindley's "School Botany" is an introduction to the Natural System; and his "Vegetable Kingdom" is a complete account of it. Price can be obtained from any bookseller.

BRIERS: *J B N*. Raising them from seeds will perhaps suit your purpose best.‡

COTTAGERS' STOVES: *W H W*. Many thanks. We have put the plans into a maker's hands, and wait for his report. Price is everything in such a case.

CLEMATIS AZUREA GRANDIFLORA: *E G P*. Since your gardener fails to strike it from cuttings, let him try layers. Cuttings of it, however, root readily enough, provided they are made of wood in a proper state of ripeness, *i.e.*, not so soft and watery as to damp off, and not so old and hard as to render the emission of roots difficult. The rooting process may also be accelerated by placing them in a gentle bottom heat.‡

FERNS: *O P*. Dry them in Bentall's paper, the best in the world for forming a Hortus siccus. No books are sold for holding botanical specimens. They must be made to order. If Fern leaves are *well* dried they will keep their colour; if they lose it no art can restore it. Of course you would not think of painting the leaves.

FLOWER-POTS: *G S*. We never recommend dealers.‡

GLASS: *S P*. Dab it (don't paint it), with either paint or any well sized whitening. If you paint it you will be too much in the dark.

HORTICULTURAL SOCIETY: *Deodara*. You can become a Fellow by being proposed by any one who is so already. If you will favour us with your name and address we shall probably be able to find some one to do you that small favour. The admission fee is 2*l*. 2*s*.; the annual payment 4*l*. 4*s*. and *retrospective*, that is to say, if you are elected in March or April you do not pay the 4*l*. 4*s*. subscription, which falls due on the 1st of May next ensuing; that is not claimed till the 1st of May in the year succeeding.

MISTLETOE: *R T C*. It will take and grow freely on the Apple or the Thorn. Slit the bark, and insert a seed or two here and there, where you wish it to establish itself, which should be on the under sides of the branches, or the birds will eat the seeds.‡

NAMES OF PLANTS. We have been so often obliged reluctantly to decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Erzeroum*. Parcel arrived. Capital specimens of fine things. Of what Pinus are the packing boards made? 234, Potentilla bifurca; 215, P. hirta; 1020, Pyrus edulis.—*A Young Gardener*. Billbergia amœna.—*Agnes*. 1, perhaps right; we do not know the plant. 2, Hypnum rutabulum; 3 is right; 4, not an Orthotrichum; probably a Tortula, but too young for determination. You would find Gardner's "Lessons in British Mosses" a very nice book indeed to study such subjects by. It is sold by Messrs. Longmans.—*A S*. 1, Habrothamnus elegans; 2 has no flowers.

POTATOES: *Ditges*. Plant your Potatoes now, if the land is ready; if not, as soon as you can. Ash-leaved Kidneys, Shaws, Oxnobles, York Regents, are among the favourites in the London Market. But it is not in our power to say whether or not your land will suit them. Good middle-sized mealy sorts, which keep well, and have *very shallow eyes*, are what the London markets want. Coarse sorts with deep eyes will never pay you.

RAIN GAUGE: *Sub*. You will find a representation of the one used at Chiswick in our vol. for 1848, p. 56.‡

ROCK PLANTS: *Sub*. Mr. Turner, Nurseryman, Southgate, Middlesex; and Mr. Wood, Norwood, Surrey.‡

RUSSIAN MEASURES: *Urban*. A Tschetwert = 5 bush., 3 pks., 1½ qt.; an archine = 2.3625 feet; a verst = 1167 yards.

SEAKALE: *Ravenswood*. Slow growth is doubtless the cause of its being hard. The plants are possibly old; if so, you had better replace them with young ones.‡

VINES: *Ezonian*. You must first ascertain where the roots of your Vines are before you attempt to renovate the border. The Vines being so old, most likely their principal feeders are far distant from the S feet border. Where you find them, there you may encourage them by manure and manure-water; but it will not be advisable to remove and replant them; they are too old. If the subsoil is moist you can probably drain it without touching the roots. It is doubtful whether you will be able to ripen Hamburghs and Frontignans outside a boarded roof. Good crops have been grown under very old sashes, and, with a little repair you may do the same.‖

VIOLETS: *Florence*. Your Russian Violets may be divided and planted out as soon as they have done flowering. Runners make capital plants; remove them in May. A shady but not confined place will suit them perfectly.‡

MISC.: *A Constant Sub*. We know nothing about the association you name. If it is political, mind your own business and have nothing to do with it. Depend upon it your master will not approve of your joining it.

MANURES.—The following Manures are manufactured at Mr. LAWES' Factory, Deptford Creek:—

Turnip Manure	per ton	£7	0 0
Superphosphate of Lime	„	7	0 0
Sulphuric Acid and Coprolites...	„	5	0 0

Office, 69, King William Street, City, London.

N.B.—Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia.—Sulphate of Ammonia, &c.

PERUVIAN GUANO, the guaranteed import of Messrs. ANTONY GIBBS AND SONS, Lobos Island Guano, Superphosphate of Lime, and all Artificial Manures, Linseed and Rape Cakes, &c.—WM. INGLIS CARNE, 10, Mark Lane, London.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PURSER, Sec. Bridge Street, Blackfriars.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desirous of receiving instructions in Chemical Analysis and Assaying, will find ample facility and accommodation at the College.

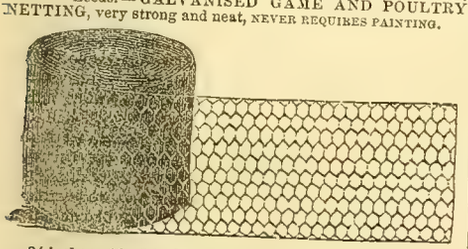
PEAT MOSS CHARCOAL, AND OTHER MANURES.—The Undersigned are appointed sole Agents by the Peat Moss Charcoal Company, for the sale of this valuable fixer and distributor of ammoniacal matter.

Also on Sale, Peruvian Guano, Superphosphate of Lime, Gypsum, Nitrate of Soda, Bone-Dust, Sulphuric Acid, and all other Manures of known value.—Apply to MARK FOTHERGILL & Co., 204A, Upper Thames Street, London.

TANNED GARDEN NETTING for protecting Fruit Trees from frost, blight, and birds, or as a fence for fowls, pigeons, Tulips, and seed beds, can be had in any quantity from JOHN KING FARLOW'S, Fishing Tackle and Net Manufactury, 4 and 5 Crooked Lane, London Bridge, at 1½d per yard one yard, 3d. two yards, or 6d. four yards wide. Rabbit, Sheep, and Fishing Nets of every description in stock or made to order.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1d. per square yard; 200 yards, 14s.; 500 yards, 30s.; 1000 yards, 50s. Scrim Canvass, for Wall Fruit.—At EDGINGTON and Co.'s, 17, Smithfield Bars, City, and Old Kent Road, Southwark, where may be seen erected Emigrant Tents in great varieties, on their latest improved principles, and also at Brunswick Street, Poplar, near the East India Export Dock.

H. J. MORTON AND CO., 2, Basinghall Buildings, Leeds.—GALVANISED GAME AND POULTRY NETTING, very strong and neat, NEVER REQUIRES PAINTING.



24 inches wide, 3-inch mesh, 4½d., 6d., and 8½d. per yard.
24 inches wide, 2-inch mesh, 7d., 9½d., and 1s. per yard.

GALVANISED IRON SPOUTING, for Dwellings, Cottages, Farm Buildings, &c., NEVER REQUIRES PAINTING.

Galvanised Iron Liquid Manure Pumps, Water Cisterns, Troughs, and all kinds of Iron Work, Asphalte Roofing Felt, &c.

WARNER'S PATENT FARM AND COTTAGE PUMPS.

Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

	£	s.	d
Patent Pump	1	15	0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3	0	0

Larger sizes if required.

The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.

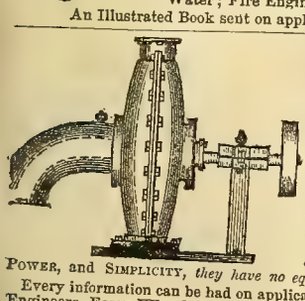
May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

JOHN WARNER & SONS,

8, CRESCENT, JEWIN STREET, LONDON.

Every description of Machinery for Raising Water; Fire Engines, &c.

An Illustrated Book sent on application post free.



CENTRIFUGAL PUMPS.

Contractors, Builders, Engineers, Brewers, Paper Makers, Manufacturers, Gardeners, Works of Drainage or Irrigation, and all who may have water at whatever temperature to raise, will find it their *interest to use these Pumps.*

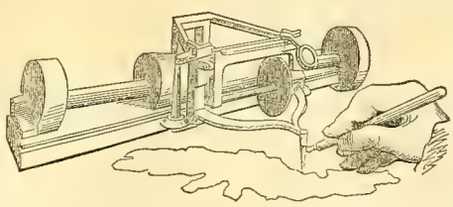
For ECONOMY, EFFICIENCY, DURABILITY, POWER, and SIMPLICITY, *they have no equal.*

Every information can be had on application to GWYNNE & Co., Engineers, Essex Wharf, Strand, London.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

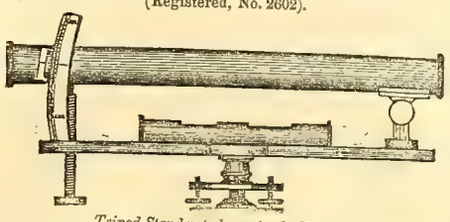
TO SURVEYORS, ARCHITECTS, & ENGINEERS.



SANG'S PLATOMETERS; OR, SELF-ACTING CALCULATORS.—These Instruments tell accurately the contents of figures drawn on Maps. They effect a great saving of time and labour, as in order to find the area it is only necessary to lead a tracer round the outline of the figure, however irregular it may be. Price 10*l.* each. Sold by JOHN SANG, Kirkaldy; and by Messrs. ELLIOTT & SONS, 56, Strand, London.

DRAINAGE—ROAD-MAKING.

NEW LEVELLING INSTRUMENT.
(Registered, No. 2602).



Tripod Stand not shown in the Figure.

This Print represents the Instrument one-fifth the real size.

THIS is a simple and effective Self-recording Instrument, suitable for Levelling Drains, Sewers, or Roads, or for measuring the Elevations and Depressions of the Ground. It consists of a Telescope, Level, Graduated Arch, and Tripod Stand. The Arch is so divided as to show the rise and fall in feet and inches. The Instrument can be set to any slope, which will enable a workman to cut the ground exactly to the inclination required.

From the *Practical Mechanic's Journal*, Feb. 1, 1851:—"In the hands of even the most unlettered farm servant this little instrument will afford the most correct measurements, as the operator has only to level the plate and bring his sight to bear upon the object, when the elevation or depression is given at once. It will be a most useful contrivance for draining or road-making."

Testimonial.—"I have examined Mr. Gardner's Drainage Level, and have no hesitation in recommending it as a most useful addition to the instruments of the practical surveyor and engineer. It is applicable for all kinds of levelling work, and is perfectly manageable in the hands of the farmer or his labourers, whilst the price is extremely moderate."—DAVID SMITH, C.E., Glasgow.

Price 4*l.* 4*s.*

Made only by GARDNER AND CO., Opticians and Mathematical Instrument Makers, 21, Buchanan Street, Glasgow.

A finer modification of the same instrument, much prized by the Civil Engineer, Price 9*l.*—G. & Co. also supply plainer levelling instruments, at 35*s.*, 30*s.*, 20*s.*, 15*s.*, and 10*s.* 6*d.* each.

GARDNER'S IMPROVED INCLINOMETER,
Price 10*s.* 6*d.* and 15*s.*

This Instrument is adapted for the pocket, and will form a most useful accompaniment to the Drainage Level, enabling the workman in laying drain-tiles or pipes, to place them exactly at the inclination which has been shown by the Drainage Level.

LAND DRAINAGE.

MR. BAILEY DENTON'S TABLES OF COST, &c., price 1*s.* 4*d.* Sold by METCHIM, Parliament Street.

MR. BAILEY DENTON'S WORKMAN'S A LEVEL, price 1*l.* 10*s.* Sold by JONES & Co., High Holborn, London.

LAND DRAINAGE.

MR. JOHNSON begs to inform Landowners, Agents, &c., that he is prepared to undertake the Drainage of Land, either by Contract or by a small charge per acre for planning and setting out the Drains, taking Levels, superintending the Work, &c.

Mr. J. has been for several years constantly employed as a Drainer in most of the Counties in England, and can give numerous satisfactory references. Plans for Tilery Buildings, and every information on Drainage can be obtained at the Office, 12, Abingdon Street, Westminster.

TO LANDOWNERS, SOLICITORS, ESTATE AGENTS, ETC.

THE LANDS IMPROVEMENT COMPANY, incorporated by special Act of Parliament, 1853, having perfected their organisation, are prepared to receive applications for the execution of improvements, under the provisions of their Act.

The Act extends to England, Wales, and Scotland; and empowers persons in the actual possession of lands, or in receipt of the rents, such as tenants for life, trustees, bodies corporate, incumbents of benefices, mortgagees in possession, guardians of infants, &c., to effect substantial improvements on their estates, and to convert the outlay on such improvements into a terminable annuity or rent-charge of from 14 to 25 years, at will.

The Company, acting under the supervision of the Inclosure Commissioners, will undertake and execute improvements, or will supply the capital to landowners preferring to execute improvements themselves, or will grant the powers of their Act to landowners seeking merely to charge the inheritance with the outlay on improvements from their own funds.

The Agricultural Works of Improvement particularly specified in the Company's Act, are:—

1. The Drainage of any Lands by any such means as the Inclosure Commissioners shall approve.
2. Irrigation, and Warping of Lands.
3. Embanking of Land from the Sea, or Tidal Waters, or Rivers, in a permanent manner.
4. Enclosing or Improving the Drains, Streams, or Watercourses of the Land, under the Inclosure Commissioners.
5. Reclamation of Land lying waste.
6. Making Farm-roads to the extent of one-half of the outlay for such roads.
7. Clearing Lands.
8. Erection of Farm-houses, and other Buildings required for farm purposes to the extent of three-fourths of the outlay for such Farm-houses and other Buildings.

In effecting the above Improvements there may be erected any Engines, Machinery, Engine-houses, Mills, Kilns, Sheds, Yards, Shafts, Tanks, and Reservoirs, Pipes, Conduits, and Watercourses for Irrigation, Tram-roads and other ways, Bridges, Weirs, Sluices, Flood-gates, and Hatches.

For Forms of Application and further Information apply to the Hon. W. NAPIER, Managing Director, 2, Old Palace Yard, Westminster, London.

HOSE PIPING.

TO ENGINEERS, AGRICULTURISTS, GARDENERS, SHIP-CHANDLERS, AND FIRE BRIGADES.

WAITHMAN'S PATENT FLAX TUBING (1-inch to 3-inch diameter) will sustain a greater pressure, is lighter, less bulky, will wear longer, and is about 60 per cent cheaper than the leather hose pipe, and about half the price of either the gutta percha or the seamless hose. It is prepared so as to be anti-rot.

Manufactured only by WAITHMAN & Co., 36, High Street, Manchester.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

BAILY'S ROUP AND CONDITION PILLS FOR POULTRY.—This remedy has been extensively tried with uniform success, and is offered to amateurs and the public with the greatest confidence. It will effectually overcome that disease which has hitherto been the bane of the poultry-yard, and destroy that apprehension known to all poultry keepers, when a favourite and valuable fowl is seen to droop. It is inestimable for poultry returning from exhibitions, and greatly facilitates moulting.—Sold, with full instructions for use, in boxes containing 50 pills, by JOHN BAILY, 113, Mount Street, Grosvenor Square, price 3*s.* per box, or by post 3*s.* 4*d.* "Fowls, by Baily," the most useful and plainest treatise of the day; price 2*s.*, by post 2*s.* 6*d.*

Baily's Registered Fountains, universally adopted and approved. Drawings and particulars, by post, on application.—113, Mount Street, Grosvenor Square.

PATENT ROOT GRATING MACHINE.

BUSHE & BARTER'S PATENT ROOT GRATING MACHINE, Manufactured and Sold by ALEX. SHANKS & SON, Arbroath, Forfarshire, from whom particulars, with prices, may be had.—Arbroath, Jan. 28.

ANTHONY'S PATENT AMERICAN CHURN.—Extract from the Royal Agricultural Society's Report of the trial of Churns at the Gloucester meeting in July last. "In this trial the American Churn not only maintained its character in producing butter rapidly, but in producing a greater quantity from the like amount of cream." It made from 4 quarts of cream 4 lbs. 6 oz. of butter, being 8 oz. more than any of the other Churns from the same quantity and quality of cream. Price Lists of Churns and Implements by the best makers sent free, and Illustrated Catalogues on receipt of eight postage stamps. BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, London, who have always a large stock of Steam-engines, Ploughs, Harrows, Diggers, Waggons, Carts, Threshing and Dressing Machines, Mills, Oat and Grain Bruisers, Oilcake Breakers, Reaping Machines, Haymakers, Horse-rakers, Turnip Cutters, Liquid Manure Carts, Parkes' celebrated Steel Digging Forks and Draining Tools, Pumps for Manure, Farm Fire Engines, and for Garden Purposes, &c. &c.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, and 52, Little Britain, London.

ROYAL AGRICULTURAL COLLEGE, CIRENCESTER.

PATRON—His Royal Highness PRINCE ALBERT.
PRESIDENT OF COUNCIL—Earl BATHURST.
PRINCIPAL—Rev. J. S. HAYGARTH, M.A.
PROFESSORS, &c.

Chemistry—J. A. C. Voelcker, Ph D., F.C.S.
Geology, Zoology, and Botany—James Buckman, F.G.S., F.L.S.
Veterinary Medicine and Surgery—G. T. Brown, M.R.C.V.S.
Surveying, Civil Engineering, and Mathematics—F. Armstrong, C.E.
Manager of Farm—G. Austin.
Assistant to Chemical Professor—A. Williams, M.R.C.S.

The first Session of 1854 will commence early in February. The annual fees for Boarders vary from 45 to 80 guineas, according to age and other circumstances. The Fee for Out-Students is 40*l.* per annum. The College Course of Lectures and Practical Instruction is complete in one twelvemonth—though a longer time is recommended. There is a department for general as well as for agricultural purposes. Prospectuses and information can be had on application to the Principal.

The GUIDE TO THE ROYAL AGRICULTURAL COLLEGE FARM may be obtained of HAMILTON, ADAMS, & Co., Paternoster Row, London; and EDWIN BAILY, Cirencester. Price 1*s.*

THE LABORATORY of the ROYAL POLYTECHNIC INSTITUTION is always open for the reception of pupils, under J. H. Pepper, Esq., F.C.S. A.C.E. &c. Careful Analyses and Assays of Soils, Minerals, Waters, Mercantile or Agricultural Products, are performed with despatch, accuracy, and economy.

For terms apply to Mr. R. I. LONGBOTTOM, Secretary.

The Agricultural Gazette.

SATURDAY, FEBRUARY 4, 1854.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, Feb.	8—	Agricultural Society of England.
THURSDAY,	9—	Agricultural Imp. Society of Ireland.
WEDNESDAY,	15—	Agricultural Society of England.
THURSDAY,	16—	Agricultural Imp. Society of Ireland.

Mr. PUSEY's paper on the action of THE NITRATES AS MANURES, and on their relations to guano, is one of the most suggestive and interesting which has ever been published in the Society's Journal. The interest which would at any time attach to it, as bearing on the practice of the farmer, is enhanced at the present time by the condition in which the guano market just now stands. The current supply of this manure, and the natural store from which it is taken, are both apparently so short that farmers who have hitherto depended on imported manures* may well be anxious on the subject. The evidence which this paper offers of the applicability of nitrate of soda as a substitute for guano, will be read by uch men with great interest.

* Take, for instance, Mr. HOPE, of Fenton Barns, East Lothian, who occupies 660 acres, and who states that unless portable manures are applied at the rate of 1*l.* per acre over the whole farm, he cannot continue to farm at a profit.

The evidence in question seems entirely satisfactory. The assertion is, that the ammonia of the guano is perfectly replaced by the nitrate; and that as to the other ingredients of guano, they could, wanted, be added from other sources easily enough. This assertion is borne out by a large mass of well-selected experiments. For instance:—Mr. Hope, of Fenton Barns, has found 90 lbs. of nitrate and 180 lbs. of guano better for Grass than double the quantity of guano by itself. And on Wheat, 1 cwt. of nitrate of soda with 1 cwt. of common salt did, in 1852, beat 3 cwt. of Peruvian guano per acre. Reports from other quarters testify to the same truth, and thus we may hope that the large supplies of nitrate of soda in Peru may so far supplement the failing supplies of guano from the same country as to hinder that rise in prices which is now threatened.

We prefer the practical portion of Mr. Pusey's paper to that in which he discusses the theory of the subject. Whatever may be the ultimate fate of the law which he asserts to determine all vegetable growth, we cannot but notice how much less cautious is the process by which this law has been ascertained than that by which the conclusions on the practical question of a substitute for guano have been arrived at. In the case of the latter, experiments are quoted from all parts of the country, and the inferences in every case being alike, justify a confidence in the practical lesson which they all combine to teach. In the former case, a single experiment is quoted—dilute nitric acid is compared with nitrate of soda and with soda by itself, and the fertility consequent upon the application seems to have been in proportion to the nitrogen present in the manure; being nothing at all when the base of the salt alone was employed, and where no nitrogen at all was therefore applied; and "we may now, therefore, assume, with unhesitating certainty, as a great law of Nature, that *substances strengthen vegetation mainly by their contents of nitrogen.*" This is surely far too sweeping a conclusion to be drawn from a single experiment, or from any number of experiments in a single locality. Any reader of this paper who has been previously led by Liebig and others to believe in the importance of soluble mineral substances, alkalies, &c., as manures, will consider the experiment in question to be perfectly consistent with what is called the mineral theory, on the assumption that the soil was already rich in alkaline matter. We think that the composition of the soil must be known before the conclusion which Mr. Pusey draws in reference to vegetation generally can be proved, even of the one case on which a great law of Nature is thus so unhesitatingly built.

We believe now as before that there are many substances to which plants *must* have access—every one of which is essential. It may be a general law of Nature that ample provision is made of nearly all —Mr. Smith, of Lois Weedon, believes that ample provision is made of absolutely all, at least for the wants of some plants. If, then, there be but one which is generally deficient, then it may be practically true—and yet not in itself a truth—that substances strengthen vegetation mainly by their contents of that one deficient substance. In this way the practice of the farmer, which has long recognised in ammoniacal substances the value of nitrogen as a manure, may be reconciled with Mr. Pusey's statement; but if that statement be read—and it may be so read—as implying the comparative unimportance of other substances, which are equally essential with nitrogen, then so far from teaching a great law of Nature, it will, we believe, really retard the progress of sound agricultural theory.

The need of more definite information about the agricultural produce of the country is forcing itself upon the attention of commercial men. The representations which they are making upon the subject will probably exert even greater influence upon Government than those of agricultural societies. It is in its relation to the current value of food that the collection of agricultural statistics properly claims the attention of Parliament. Correct information on the subjects thus embraced would be of great immediate value both to producers and to importers of food, but neither of these classes could properly insist on Government interference simply on its own behalf; it is because through both of them the interests of the people generally are affected that the subject becomes of national importance. We are glad, therefore, that both parties have now joined in the representations which have been made on this subject. A memorial is to be presented to the Earl of Aberdeen, which has been influentially signed by bankers, merchants, corn-factors, ship-owners, and brokers, of the city of London, in which the relations of the subject to trade, commerce, and shipping are very forcibly set forth. It is stated that—

"The fluctuation in the prices of grain has been nearly 100 per cent. within the last four months, and now, even four months after the harvest has been secured, no certain knowledge has been obtained as to whether it will afford six or ten months' consumption. The consequence of this uncertainty is an equal uncertainty in all the branches of trade and shipping connected with grain, and good authorities vary no less than 5,000,000 quarters in their estimate of the importations of Wheat and flour required during the current season, and a doubt is thus implied to the enormous extent of 1,000,000 of tons as to the quantity of shipping necessary to transport it; and the uncertainty of this particular article of human food creates an uncertainty in every article of commerce and consumption."

The natural tendency of ignorance upon so important a subject as the food produce of the country is here strikingly set forth; and the actual commercial history of the past few months is a striking confirmation of the statement. We are told in the City article of the *Times* that, through the inability of the capitalist

"to get materials for a conclusion, he was prevented in the early part of the season from investing his money in grain wherever he could despatch agents to procure it, while his French rival, in the possession of carefully collected statements, was able to act promptly even in our own markets; the agriculturist finds to his mortification that he sold much of his produce at less than two-thirds of its subsequent value; the shipowner was ignorant where his vessels would be wanted, and sent them out of reach when they might have made fortunes at Odessa or New York; and the manufacturer, whose whole success depends upon whether the value of money will be one per cent. more or less, has not only been without the means of anticipating the efflux of bullion, but is actually at this moment in the dark as to whether we have attained and paid for a sufficient supply to render much further pressure unlikely, or whether our stocks are still so far below what will be requisite as to keep up a constant outflow of specie."

The contrast between English policy and that of other countries in connection with this subject is properly insisted on in the memorial just referred to:—

"Both on the continent and in America, the statistics of agriculture, as they affect the bread of the people, are justly regarded as a first object of national investigation, and early and accurate information is every year obtained, by which the merchant can anticipate the course of exports and imports. This information enables timely arrangements to be made for supplying the deficiency of an unproductive harvest, or for disposing of the surplus of a good one. It provides, as far as human foresight can, against the unavoidable influence of seasons, and the ruinous fluctuation of price and consequent derangement of commerce."

Of course it is in the more strictly agricultural relations of the subject that we are interested—and probably it is to these that the intelligent reader of the American and Canadian statistical reports will look as their most trustworthy feature. The mode in which these reports are compiled cannot result in more than qualitative information on the subjects to which they refer. We may read them with tolerable certainty as to the comparison they present with previous years, which is the indication they give of agricultural progress; but, in reference to actual quantity of produce then ready for market, which is what the commercial man desires to know, they are certainly less to be depended on.

We have before us now the first report of the Secretary of the Board of Registration and Statistics on the Census of the Canadas for 1851-52; and while the results given are quantitative in all the many branches which they embrace, we presume that it is in their comparative character, whether in contrast with the United States, which is very well detailed, or in contrast with the agricultural position of Canada itself in previous years, that they will prove most instructive. Certainly the inferences drawn in the very able report which accompanies the tabular statement are of the highest agricultural importance, and shew very strikingly of what immense value to the agricultural interest of a country properly compiled agricultural statistics would be. We shall next week select for remark some information conveyed, in the report before us, whether to agricultural emigrants from this country, on the prospects of the colony, or to those who cannot be tempted from their homes, on the value of the example shown to the old country by this well-arranged review of the agricultural condition of the Canadas.

THE MANAGEMENT OF MANURE.

In a late Number of the *Agricultural Gazette*, "C. L., Cirencester," after having passed a just and favourable judgment on the merits of Morton's "Cyclopedia of Agriculture," now in course of publication by Blackie and Son, remarks very properly that it could not be expected that a work produced by numerous contributors should exhibit a consistent whole, like the effort of a single mind. With this remark I entirely agree, and believe that one of the advantages which the subscribers of the Cyclopedia will derive from its perusal is just founded on the circumstance that there is not presented to his understanding the effort of a single mind, but the well-digested labours of many, who have showed themselves, by former publications, thoroughly well informed on the particular subjects on which they write. Differences of opinion on agricultural subjects, as on most subjects, perhaps, will always exist in our necessarily imperfect state of knowledge of the mysteries of nature. It certainly cannot be expected that all the contributors to the Cyclopedia should entertain the same opinion on every agricultural subject, and the fact that in the various articles in the Cyclopedia here and there views apparently opposed to each other are candidly discussed, in my opinion, rather adds to the merit of this publication than detracts from it. The reading public, however, may justly demand that an author should be consistent with himself in all he writes, and has a perfect right to expose his inconsistencies, especially if they occur in the writings upon one and the same subject, and if they are not merely of a trifling kind, mere slips of the pen, but inconsistencies which in all charity can only be ascribed to ignorance or unwarrantable carelessness. An inconsistency of the latter description "C. L., Cirencester," believes to have discovered in the article "Manure," in the Cyclopedia, and it is for that reason that I beg to offer a few explanatory remarks, which I trust will clear me of the charge of an apparently flagrant inconsistency. And I would observe at once that the charge of inconsistency arises from the misconception which "C. L." entertains of the experiment, which is mentioned at page 343 in illustration of the loss farm-yard manure undergoes in keeping, under bad management. It is there stated that 100 cwt. of fresh farm-yard manure have been found to become reduced to 80 cwt. when allowed to ferment until the straw became half rotten; on keeping till the straw became quite rotten, and the manure fat and cheesy, the 100 cwt. diminished to 60 cwt.; and when the fermentation was still further carried on until the manure appeared completely decomposed, the original 100 cwt. were reduced to only 40 or 50 cwt. This loss in weight is then explained to be due not merely to the dissipation of water and other less valuable constituents of farm-yard manure, but also to nitrogen, which passes off in the form of volatile ammonia, as the fermentation proceeds. Analysis has shown that 100 cwt. of farm-yard manure contained about 40 lbs. of nitrogen; and that during fermentation in the first period (*i. e.*, when allowed to ferment until the straw became half rotten), 5 lbs. of nitrogen are dissipated in the form of the volatile ammonia; in the second (*i. e.*, fermented until the straw became quite rotten, and the manure fat and cheesy), 10 lbs.; in the third (*i. e.*, fermented until the manure appeared completely decomposed), 20 lbs. Completely decomposed common manure has thus lost about one-half of its most valuable constituent (nitrogen). This passage appears to me sufficiently intelligible. "C. L.," however, infers from it that well-fermented and perfectly-decomposed manure cannot contain any nitrogen at all.

He evidently arrives at this strange conclusion by separating the latter part of the paragraph referred to from its connection with the former, and thus does not attach the precise meaning which has been assigned to each of the three periods of fermentation. By leaving unnoticed the details of the experiment, referring to the loss in weight of the manure, he conveys to the reader the erroneous idea that in the second period of fermentation, which period has been accurately defined previously, 10 lbs. of nitrogen are dissipated in the form of ammonia, in addition to the 5 lbs. which have escaped in the first period (*i. e.*, when allowed to ferment until the straw became half-rotten), and that in the third period 20 lbs. of nitrogen are lost in addition to the 15 lbs. dissipated in the first and second periods. However, 20 and 15 only make 35 lbs.; and as the manure originally contained 40 lbs. of nitrogen, the remaining completely decomposed manure would still contain 5 lbs.; and even according to "C. L.'s" own interpretation of the experiment, the conclusion "that well-fermented and perfectly-decomposed manure cannot contain any nitrogen at all, the whole having been disposed of in the three stages of decomposition, in the form of ammonia," is quite untenable. But on reading carefully the whole experiment mentioned in page 343 in the Cyclopedia, it will be found that the manure produced in the first period of fermentation, as well as that obtained in the second and third, are richer in nitrogen than the original fresh manure. For he will find it stated that 100 cwt. of fresh manure, containing 40 lbs. of nitrogen, were reduced to 80 cwt., when allowed to ferment until the straw became half rotten, during which period 5 lbs. of nitrogen were lost. The remaining 80 cwt. will thus contain 35 lbs. of nitrogen, or 100 cwt. of such manure, 43¾ lbs. of nitrogen. Further, the 100 cwt. of common manure, when fermented until fat and cheesy, will be reduced to 60 cwt., during which second period of fermentation 10 lbs. of nitrogen were dissipated in the form of ammonia. The 60 cwt. of manure thus produced will consequently contain 30 lbs. of nitrogen; or 100 cwt. of such fat and cheesy manure will contain 50 lbs. of nitrogen. And lastly, that 100 cwt. of manure, fermented until perfectly decomposed, will be reduced to 40 or 50 cwt., and lost, in this third period of fermentation, 20 lbs. of nitrogen. The 40 cwt. of perfectly decomposed manure did thus retain 20 lbs. of nitrogen or 100 cwt. of such manure will contain 50 lbs. of nitrogen.

It will be observed that the result of this experiment s not inconsistent with the statement in page 338 of the Cyclopedia, namely, that well fermented farm-yard manure contains more nitrogen. Every practical farmer knows that well-fermented farm-yard manure acts more energetically on vegetation than fresh dung; and it would be indeed strange if such manure, containing the essential fertilising substance in a smaller compass than in fresh dung, should not be more valuable than the latter. It does not follow, however, from the fact that well made and well fermented manure is more valuable than fresh, that common manure should always be applied to the land in a perfectly decomposed state. On the contrary, wherever it is admissible, farm-yard manure ought to be brought as fresh as possible on the land, as thereby the unavoidable loss in valuable fertilising substances which attends the fermentation of dung in heaps, is almost altogether prevented.

The experiment referred to shows in a forcible manner the loss which farm-yard manure undergoes in keeping, under bad management, and proves, also, that even completely decomposed dung is richer in nitrogen than fresh. For illustration sake, probably an extreme case has been chosen; but in actual and good practice the loss in nitrogen will be, I have no doubt, less considerable; and well made, though completely fermented manure, I think, will be much richer than the manure obtained in the third period of fermentation in the above experiment. *A. Voelcker, Cirencester.*

SCEINCE AND AGRICULTURE.

[We have been favoured by Dr. Eade with a copy of this paper, read by him before the Blofield and Walsham Farmers' Club, December 12, 1853.]

I SUPPOSE I may take for granted that all are agreed that improvements have been effected to a great extent during the past few years, both in the theory and practice of agriculture; and that none here present are of opinion, that the changes which have taken place in agricultural proceedings are simply alterations but not improvements; or that whilst in every other department of science knowledge has increased, in agriculture alone has the mind of man effected nothing. And we must remember that it is not enough to say, *e.g.*, that 20 or 50 years ago as much corn was raised from the land as now, but in deciding upon such a point it is necessary not only to look at the quantity of corn grown, but to consider the difficulty and expense of so growing it, of threshing, carting, and grinding it; and, in fact, to take into consideration every process connected with its manufacture from the time the seed is sown until it has gone through all its stages, and, in fact, become seed again.

In looking for the signs of improvement in agriculture, as exhibited generally upon the face of the country, we shall see these most marked, not in districts such as some of those in East Norfolk, where husbandry has for a long time been practised on the best known system, but in districts where farming has, until recently, been comparatively neglected; such as some of the Western portions of this county—in speaking of which, in a work upon Norfolk husbandry published by a Mr. Marshall in 1794, the author thus writes:—"The western division is either marshy low land, applied chiefly to the dairy, or open sheep walks and extensive heaths, whose stock are sheep and rabbits." Yet of East Norfolk itself, of which he otherwise speaks in glowing terms, he says:—"The roads are unpardonably bad, narrow, shaded, and never mended. The inclosures, in general, small, and the hedges high and full of trees, giving to the traveller the idea of being ever on the verge of a forest." At the present day, one would in vain try to recognise by such descriptions as these the well cultivated fields, and well stocked lands of large portions of West Norfolk; or the firm macadamised roads, the ample fields and well trimmed hedges of our own division of the county.

Most of the improvements which have been effected in agricultural operations may be classed under the two heads of chemical and mechanical, both perhaps of equal importance. For, on the one hand, what knowledge can be more important to the farmer than that which tells him not only that guano is good for his land, but why it is so; which tells him what time is most suitable for its application, and what soil most adapted for its reception: or what can be more important than that which discerns that some saline manures, as nitrate of soda or others, will produce a good crop of Wheat from a field that hitherto had yielded a very bad one; or, again, that tells the farmer not only the fact (which he might have guessed at previously), but why a clay soil may be safely trusted to take care of that manure which is placed upon it some time before it is wanted, whilst a poor gravelly soil will retain little or none of it, but allow it all to be washed away by the first heavy rain that falls—or, on the other hand, is it not of immense importance to the farmer to be furnished with implements, whereby he can speedily and effectually plant his seed, cultivate his young crops, secure his harvest, thresh his corn, and transport it, if need be, to distant markets; and all this not merely by the multiplication of human or horse labour, but by the application of those principles which science develops, and human ingenuity turns to useful purposes? And let us not forget that the great and, in fact, the only real object of science, is to increase knowledge, to substitute certainty for random proceedings and vague speculation, and to discover by the conjoined light of reason and experiment those truths which it takes ages of experience alone to discover: and in this sense any one may, in his own way, be it ever so humble, be a zealous cultivator of science. Every experiment, however small, if conducted carefully and sensibly, and its results noted and properly weighed, is in so far a contribution to human knowledge, and a portion of that foundation of facts upon which *future* scientific truths may be based. But, perhaps, we are scarcely aware of the great alterations which really have taken place in agricultural processes within some few years, so gradually have these changes been wrought. Now, in various portions of the work above mentioned, we find the following passages:—

"There is not, perhaps, a drill, a horse-hoe, or scarcely a horse-rake in East Norfolk."—"Cow-houses are unknown in a Norfolk farmery."—"Bullock sheds are sometimes, but not generally erected."—"Old hedges abound with Oak, Ash, and Maple stubs, off which the wood is cut every time the hedge is felled; also with pollards."—"Under-draining is a practice which is not of long standing in the district, but may, I make no doubt, be found highly useful to many parts of it."—"Drilling (for Wheat) is almost unknown in Norfolk, notwithstanding the soil is so peculiarly adapted to the practice."

It is therefore since the period at which this book was written that, in this county at least, the important alterations in the treatment of cattle, in the management of hedge-rows, in draining, in growing crops in rows, and in many other points, which have resulted in the improved methods of the present day, have taken place.

I would enumerate some of the most important of these improvements to consist in the introduction of improved machines for drilling, hoeing, scarifying, and clod-crushing, as well as for threshing and reaping, in the more economical application of horse-power to purposes of draught; but most of all, in the application of steam to purposes of draining, threshing, the carriage of corn and cattle, and other general requirements of a farm. I would also mention the improved methods of housing and feeding stock, based upon the knowledge which an acquaintance with the chemistry of the fattening process confers, the application of guano and various saline manures to land; as well as many other processes, which the researches of Prof. Liebig into the mysteries of animal chemistry, of Prof. Way into the properties of soils, and those of other labourers in the fields of botany, geology, and meteorology, have enabled us to adopt.

It would seem indeed that in nearly every department of agriculture, has considerable progress been made towards perfecting the appliances at the command of the British farmer, and that whilst the greatest activity has prevailed in every other branch of industry and science, agriculture has by no means been neglected. Perhaps the first great stimulus was given to it by the high prices obtained for the produce of land during the late war; subsequently the long continuance of peace promoted the cultivation of this in common with other unexplored subjects; and, still more recently, increased competition has compelled those engaged in the tilling of land to neglect no means of increasing their produce or of diminishing the cost of raising it. And accordingly never was there a time when the demand was greater for all the means and appliances which art or science could furnish for the attainment of these objects.

Thus it is within a very few years that we have seen carts exchanged for waggons; greatly improved ploughs introduced; reaping machines invented; steam used for threshing and for draining, and a more general application of artificial manures to land. Whilst even within the last few weeks attention has been called by Mr. Mechi to an improved threshing machine invented by an American, which promises to do as much for the farmer in knocking out his corn as the new reaping machine does in harvesting it.* This machine is called by its inventor "a grain separator," and was lately described in the *Times* as "being very portable, weighing only 14 cwt., threshing easily and without waste at the rate of one bushel in 40 seconds, turning out the grain perfectly clean and ready for market, and as being manufactured in America for 23*l*. It is, therefore, much lighter than the lightest of our present machines; does as much if not more work than the best of them, and with much less power; dresses the grain, which they do not; and costs much less money. And although it has some trifling disadvantages, yet upon the whole it would appear to be a decided improvement upon the machines at present in general use." Still more recently attention has been called to another American invention, which although comparatively unimportant in itself, yet serves to show the perseverance and ingenuity which are at work upon every detail of mechanical art in the New World. It consists of an improved hand-barrow, in which, by placing the wheel beneath the body of the barrow, the greater part of the weight is removed from the hands of the person using it.

But great as have been the improvements in nearly every mechanical appliance, whether applied to agriculture or not, there is no sign of any abatement in the zeal with which those engaged in this branch of industry are pursuing their investigations. There is nothing which might lead us to suppose that we had attained to perfection in any of our departments; on the contrary, everything seems to lead to an opposite conclusion. As railroads have superseded coach travelling, as the electric telegraph has supplanted the ancient modes of communicating intelligence, and as the scythe has superseded the sickle, the threshing-machine the flail, and human and horse labour are rapidly giving way to the influence of steam—so there is reason to suppose that these themselves are destined shortly to give way to more powerful influences, either altogether new or the present ones modified by causes at present not in operation. There seems to be great reason to infer that electricity is yet destined to play a very important part in the history of mechanical inventions. Even now the expense of generating the necessary power is the only obstacle to its successful employment in many processes of the arts; and it seems almost impossible but that such an all-pervading and all-powerful agent should be turned sooner or later to far more general account than is at present the case.

Let no one think, then, that in the present state of the world it is possible for farmers to stand still any more than any other class of mankind. Even M'Cormick's reaping machine, which at its first introduction Mr. Pusey described as "the most important addition to farming machinery that has been invented since the threshing machine took the place of the flail," has been already much altered and improved; and many hands are at work at the attempt to construct a steam plough or cultivator, and it is even said that an American has successfully overcome the difficulties which have hitherto stood in the way of its practical usefulness. But surely each new invention cannot be otherwise than a boon to the farmer if it enable him to produce cheaper or better than he has hitherto been enabled to do; and, therefore, although the future of the farming interest will in all probability be subject to as much change as that of any other interests, yet as these changes will, no doubt, take place gradually and by a process of continuous development, there is no reason to doubt that farmers will willingly and profitably adopt each new improvement as it is brought before their notice.

Many elements bearing upon agricultural prospects besides those which I have yet alluded to, are now at work, which must have an important influence upon the future welfare of this branch of industry. Thus the stimulus which the increase of competition from the opening of our ports to foreign produce has caused, has been everywhere and most usefully felt, the science of farming having advanced more in the last five years than in twice that number of any preceding years. The pressure of want upon the poor, and the superior attractions of gold producing and less thickly inhabited countries, are sensibly thinning our labouring population, and making an increased use of mechanical appliances a matter of absolute necessity. And lastly, the increased knowledge both of our wants, and of the means of supplying these wants, through an acquaintance both with the number of persons to be fed, and the quantity of material at command to supply their requirements, which more accurate statistical information upon agricultural matters will afford, will also be sensibly felt, in increasing our certainty, steadying our markets, and rendering the business of the farmer liable to less violent fluctuations; and leaving it subject to those only which the necessary laws of supply and demand impose upon it, in common with every other branch of producing art.

Judging then of the future by the past, I believe that the results which the further progress of science will develop will eventuate in the determination by chemists of facts, whereby we shall be able more certainly and definitely to apply manures to our crops so as only to use in the right quantity, and at the right season, those which will most conduce to the advantage of the growing plants; whereby also we shall be rendered far more independent of the seasons than we now are. That they will consist in the improvement of machinery, so that our agricultural proceedings will be more and more carried on by mechanical power, as a substitute for animal force, *i. e.*, by machinery instead of nerve and muscle: and that as a necessary consequence of this substitution, that what we lose in quantity of human power we must make up in intensity; that we shall require more and more skill in our farm labourers to direct the more complicated processes they will be called upon to superintend; and that as a further consequence an increase in them of information and intelligence commensurate with these altered circumstances will be imperatively required. And as if foreshadowing this result, we see how rapidly education is progressing, how at the present day every child does receive more or less instruction, and how the more ready interchange of ideas which facility of intercourse by reading, writing, and increased means of locomotion presents, is surely tending to raise the standard of man's intelligence, and render him more fitted for the higher class of duties he will be called upon to perform.

I believe also, that the prospects of farmers are as good now as ever they were; that in all probability the amount of competition with which they may have to contend, may yet be very largely increased; but that the resources of science will come to their aid, so as completely to compensate the increased difficulties with which they have to contend, so that if they steadily, systematically, and wisely avail themselves of each new improvement as its reality becomes assured to them, they may still confidently look forward to the land as a profitable investment, and as still a means of securing an honourable livelihood.

* On this we must refer to a report, from the columns of the "Mechanics' Magazine," in another column. ED. *Agri. Gazette.*

Home Correspondence.

Drainage Report: Cirencester Society.—In your Paper of Saturday last, in the report of the judges for draining at the Cirencester Agricultural Society, there are two or three errors: in speaking of the furrow drains on Lord de Mauley's and Mr. Ponsonby's land,

you call them tile drains instead of till drains, that is, thin stones are placed along the bottom of the drains thus A, and small stones placed at top. In speaking of Mr. Sadler's main drain, it is stated as made "within pipes," it ought to be "with 4 inch pipes;" in the report it was written, "with — in. pipes," intending to fill the space when I had inquired of Mr. Sadler the number and different sizes he had used, but it was neglected to be done. *Thos. Arkell.*

Up-and-Down Draining.—I see by a late *Agricultural Gazette* that another champion for the up-and-down system of draining has come forward in the person of Mr. Hewitt Davis; there be now, therefore, "three Richmonds in the field." I am glad of it, because I feel confident that the more this question is discussed the sooner and more completely will the truth of the principles of draining which I advocate be established. The arguments which Mr. Davis uses are directed, in the first place, to the theory of the question—the reason why drains should be laid along the line of greatest descent under all conditions of soil, subsoil, and substrata. He objects, also, to availing himself of the drains which Nature has laid in the form of subterranean furrows—the existence of which he neither affirms nor denies—because there are some hollows in them which descend below the general level of their bottom. These arguments are only a repetition of those advanced by Mr. Denton, which have been answered by you as well as by myself. Mr. Davis must therefore not consider it want of courtesy on my part if I decline going over that ground again. From arguments founded upon the theory—or rather I should say upon the hypothesis—that all soils are homogeneous, he proceeds to arguments drawn from practice, declaring that he has never seen perfect drainage effected by drains laid across the fall; but at what angle they crossed it, which is a very material point, he does not say. I also would appeal to practice. I would ask why we hear of so many failures of drains laid with the fall. I would say, also, go to Keythorpe, and you will see an example of the failure of such drains, and the success of drains laid obliquely to the fall, so as to cross subterranean furrows or channels, along which water is percolating, although those drains are laid in a retentive soil at distances of 20—aye, and twice 20 yards! I shall conclude by remarking that in travelling through Essex lately, I saw many instances of drains laid obliquely to the fall upon land having a very slight inclination, but crossing it at a much greater angle than is right, whether there are subterranean furrows or not in the land to be drained. I saw also few or no trial holes. This is not the Keythorpe system, and it must not be held responsible for the results. *J. Trimmer.*

Home-made Superphosphate.—There are some farmers so located that they cannot conveniently procure the manufactured superphosphate of lime—others, who could obtain it readily, are fearful of getting a spurious or adulterated article, and many others who would make it themselves if they knew exactly how to set about it. I have seen several directions at various times, and in various publications, but they have lacked precision, and omitted some point or other in the manipulation of more or less importance. Having given the matter some attention, I think I may offer the following directions to those who have not had any experience in this preparation. For drilling 5 acres of Turnips or Swedes, procure 20 bushels of half-inch bones, crushed in a dry state; this quantity will usually weigh about 300 lbs.; get 200 lbs. of the ordinary sulphuric acid of the manufacturer, which would generally be of the specific gravity 1.840.* Add to this acid an equal weight of water, and stir it in an earthen or wooden vessel, pour this very gently over the bones, as equally distributed as may be, delivering it close over the bones, as any splashing will destroy clothes, and may damage the operator. When the mixture has laid about two days, take it out and form it into a conical heap, and cover it with turf ashes, or such as are commonly prepared on the farm for drilling, in which state it may be left for three or four weeks, to break down more effectually any portions of bone which have not been sufficiently done before. Uncover the heap, and add to the ashes first used as many as will make up the quantity the party usually uses in drilling, whether 20, 30, or more bushels per acre, and then mix those and the bone paste very thoroughly together. Form the mixture again into a heap, and cover it with earth, to remain till within a few days of its being required for drilling, when the heap should be again turned over, and every portion of the bone paste then found should be broken down with the spade or fork, in order that the whole should be completely mixed with the ashes. The acid and bones may be mixed in various ways, but as this is an article required every season, I consider the most efficient and economical, because permanent, receptacle is a brick tank formed thus—dig out the earth in some convenient spot near the homestead, and bottom it and line it with brick (one brick laid flat is sufficient) set in coal ash lime mortar, and pointed in the inside with good fresh Portland cement. For mixing 5 quarters of bones with the acid at a time, I have found a tank 6 feet long, 3 feet wide, and 30 inches deep a convenient size. None need exceed this size, for the same mixture may be repeated every two days, until any quantity required is prepared. *C. Lawrence, Cirencester, Jan.* 31.

Profitableness of Cattle-feeding.—To "Y."—I have read your valuable articles on this subject with pleasure and instruction, and as I am a feeder of a large number of cattle, sheep, and pigs during the year, I am anxious to arrive at a remunerative way of doing it. The universal cry of the unprofitableness of cattle-feeding has always struck me as showing a great want of knowledge, either in the management of the cattle, or the want of chemical knowledge to point out to us the quantity of food the stomach of a three-year-old ox can appropriate to advantage; for we either injudiciously feed them, or they are the only exception to the general rule of things; we admit that sheep and pigs pay, and we all know that every description of manufactured articles—in short, every thing that changes hands, bears a profit, except the unfortunate ox. Now, how is this? Can you and I, with the help of Professor Johnston, place him in a more favourable light to the farmer? In the first place, can and will Professor Johnston tell us what amount of hay, Swedes, Mangold, cake, Linseed, or corn meal a three-year-old bullock's stomach can appropriate during the 24 hours, to the advantage of the feeder; and what is the worth of the refuse, both liquid and solid? I have worked out the cost of 10 beasts for a week, as well as I can from your statement, you and Mr. Hope not giving the amount of straw consumed; and I give you the cost of 10 short-horn three-year-old beasts, now feeding; my calculation is made on the following prices:—Hay, 80*s.* per load; Mangold and Swedes, 12*s.* per ton; straw, 36*s.* per load; Linseed, 52*s.* per quarter; Barley, 36*s.* per quarter. I have been in the habit of following the Norfolk system of 12 or 14 lbs. of cake or corn per ox, but this, unless you have a farm much out of condition, will not pay; and my opinion why, is, that the stomach of the ox cannot appropriate so large a quantity. Cost of 10 beasts for a week:—

M'Culloch's:—

4 tons 13¾ cwt. of roots, at 12*s.*	£2	16	3
13½ trusses of straw, at 36*s.*	0	13	6
	£3	9	9

Hope's:—

5 tons 11½ cwt. of roots, at 12*s.*	£3	6	9
6½ trusses of hay, at 80*s.*	0	13	9½
Straw not known	...		
	£4	0	6½

"Y.'s":—

1 ton 17½ cwt. of roots, at 12*s.*	£1	2	6
35½ trusses of hay, at 80*s.*	3	18	5
Straw not known	...		
	£5	0	11

Mine, or "Z.'s":—

2 tons 5 cwt. of roots, at 12*s.*	£1	7	0
8 trusses of hay, at 80*s.*	0	17	5
12 do. straw, at 36*s.*	0	12	4
280 lbs. of Linseed, at 52*s.*	1	12	6
140 do. meal, at 36*s.*	0	11	8
	£5	0	11

Singularly enough yours and mine come to the same amount. Well, there is the cost; my system is to credit the beasts one-third of the whole cost for the manure. Looking to the above table, Mr. M'Culloch's system is the cheapest; but the question to be decided by the above lots is, how long will each lot take coming out, equal value, to the butcher? If they would all come out at the same time there would be no question about it; but I am satisfied they would not. Then which is the best way for the farmer, to take seven or eight months with no cake or corn, or six months with 4 or 5 lbs. of cake or corn, or four or five months with a liberal supply of cake or corn, or both, say from 8 to 10 lbs.? I should much like to have your opinion on this, and also the cost of straw consumed by your 10 beasts per week. I fat about 250 pigs and 250 sheep a year all on grating—the former in summer, and the latter in winter; my pigs, a twelvemonth old, are now going out at from 45*s.* to 50*s.* I have 200 ewes, and at present have 177 lambs from 138 ewes, having lost only one sheep and three lambs. Your's, in great want of information. *Z.* P.S. My farm consists of 400 acres of wet, heavy land.

Covered Stackyards are to be seen in Carnarvonshire, the roof supported on stone pillars, open at the ends and sides, slated in the same manner as a house; the stack of hay made as usual within, saving the straw thatch. In the midland counties brick pillars would be most convenient, stone being the staple commodity of this county. *Respondent.*

Stoppage of Drains by Roots of Trees.—Four inch collar-pipes, 2 inches in bore, were laid at the depth of 4 feet, each joint being made secure, and, as was supposed, impenetrable to roots by tow and red-lead; and yet several of them were completely choked by closely matted fibrous roots of a young Elm, which was growing within a few yards, so that no water would pass through. *J. C. Fordal.*

Does Live Stock Pay?—I have read with interest the communications on this subject by "S." and by "Aliquis." The whole question resolves itself into the price at which a ton of Turnips can be produced. Mr. M'Culloch (in Wigtonshire) is favourably situate for soil, climate, and purchase of lean stock, as compared with the average of the kingdom. I honour his talent and success, but must not conceal his advantages. The losses of "Aliquis" would have been greater but for the use of Rape-cake, which, as I have before stated, is equivalent in its constituents to oilcake, but only costs about half the price. Mr. Lawes's recent paper, in your columns, "On Turnips as Food," throws a clear light on this subject, and is a confirmation of other experiments recorded by him in the Royal Agricultural Society's Journal. He shows that a sheep of 100 lbs. live weight, or 7 stone of 8 lbs. dead weight, consumed of white Turnips, weekly, 155 lbs., or of Swedes, 90 lbs. Or, to sum up, that 10 tons of white Turnips only produced 75 lbs. of live weight, or 40 lbs. net dead weight of mutton, or at present prices 2*s.* 6*d.* per ton; and that 10 tons of Swedish Turnips only produced 54 lbs. live weight, or, at present prices of mutton, 1*s.* 10½*d.* per ton (the latter being diminished in value by an actual loss of weight in some of the sheep). In a general way, in our county, the price paid on Swedish Turnips is 3*d.* per Down sheep per week; and as a sheep will eat, when at liberty, fully a quarter of his net dead weight daily of Swedish Turnips, it follows that you get about 4*s.* to 4*s.* 6*d.* per ton for your Swedes, and about 2*s.* 6*d.* to 3*s.* for your white Turnips. In mild, dry, favourable weather the owner of the sheep may have the advantage; but in wet, cold, and unfavourable times, instead of putting on 3*d.* per head per week, the sheep absolutely lose weight, as has been the case lately, where they depended upon Turnips alone, unsheltered. I repeat that live stock are necessary, in order to keep up the fertility of our soil; but if you keep strict accounts of what they consume at market prices, be it hay, corn, or Linseed-cake (I except Rape-cake), you will find a balance of loss chargeable against their manure, and therefore I am justified in my original calculations and conclusions. *I. J. Mechi, Tiptree, Jan.* 21.

* If it be desired to use this manure in a more concentrated state, so that the whole of the bone may be available for the root crop, one part of acid to two parts of bone, by weight, should be employed.

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Monthly Council was held last Wednesday, for the report of which unfortunately we have not, at the late hour at which it was received, been able to find room. It was largely attended: 30 new members were elected, and 50 candidates for election were named. Reports were read from the Finance, Veterinary, General Lincoln and Implement Committees. A special committee was appointed to confer with the Finance Committee, on the best means to be adopted for a reduction in the expenditure of the Society, especially in its country meeting department. In reference to the subject of farm poultry, it was resolved that a distinct steward of farm poultry should be appointed. The conditions of the prizes to be offered at Lincoln for cattle, horses, sheep, and pigs, were determined; and an offer of special prizes to the amount of 100*l.*, made by J. J. Tweed, Esq., mayor of Lincoln, for the owners of hunters, and to the breeders of improved Lincoln sheep, was accepted. The Council adjourned to the 8th of February.

Poultry.

Spanish Fowls.—I have some black Spanish fowls which were brought from Lancashire last July, and have since been kept in the courtyard with the run of the adjacent shrubberies and park. On the 3d of January last, during the late frost, when the snow had been on the ground about a week, it was observed that the large wing feathers of one of the hens had become partly white. This whiteness has gradually increased, so as to form a broad irregular band on each side; the head is quite white, and a few white feathers are scattered over the body of the hen. She is about two years old, is in good health, and was entirely black, but had not got her feathers quite full grown, after moulting, when the change of colour began. The hen is well fed, and sheltered with several other Spanish fowls, which have not changed in appearance. We should be glad to hear if any of your correspondents have noticed a similar alteration in any of their poultry. *S. P., Gloucestershire.*

Poultry: *Admirer of Polands.* Nothing can be worse than a brick-paved yard for poultry, and that alone will sufficiently account for any lack of condition they may suffer from. If, however, you have no other place in which to keep them, I would advise you to cover the bricks or part of them with at least 3 inches of gravel. Let the fowls be well provided with wood ashes in which to dust themselves, and supply them daily with sods of Grass. This I believe will restore their condition and amuse them. I think greaves or any other meat very bad food for fowls, and it often gives rise to that craving which makes the fowls appear dissatisfied. Whether for fatting or for condition, there is no better food than oatmeal slaked with water or milk, varied now and then with a little whole corn.—*A Suburban Novice.* Your hen has the roup, and the best thing you can do is to treat her with some of the remedies advertised in this paper.—*C H.* I do not think your Spanish cock's comb will ever become erect. The ulcer you complain of is almost universal among birds of this breed with lopped combs. The only treatment I should adopt would be to keep it clean by washing with warm water; and if by your ingenious process you succeed in making the comb upright, I would advise you to heal it as fast as you can by any process. You will deserve the thanks of all Spanish amateurs if you succeed. I have never known a fowl seriously injured by this ulceration of the comb.

Miscellaneous.

Deodorising Sewage Company.—On Monday last a number of gentlemen assembled at Northumberland Wharf, in the Strand, to witness experiments illustrative of the application of Stothert's patent, in the deodorising of sewage, which is to be put in operation by the above company. Their mode of proceedure at Northumberland Wharf is to pump up the sewage out of the sewer into a cistern sufficiently high to enable the liquid to run into a metal cylinder furnished with a hopper above it, and an agitating apparatus inside. The hopper contains caustic lime, which, by a mechanical arrangement connected with the pumping machinery, is admitted in small quantities into the cylinder and there mixed with the liquid sewage which flows through a short connecting pipe into another cylinder, exactly like the first, except that its hopper contains powdered charcoal mixed with a little sulphate of alumina instead of lime. This deodorises the sewage, which, charged with the contents

of the two hoppers, is forced through a gutta percha pipe into a cistern in two divisions—one to catch the thick part of the sewage, the other containing a filter of sand and charcoal—which effectually separates the sewage from the water, and out of which the latter flows in a clear state, and quite free from smell. The solid deposit found in the first compartment of the filtering cistern is formed into bricks, which are dried on thin iron plates in a gas stove, and are thus rendered portable, and they are nearly without smell. But in addition to the solid matter, the "supernatant," or clear water which issues from the filter, is also stated to be very valuable as manure. The charcoal employed for deoderising is itself prepared from the dried sewage, in order that all the ingredients used may be of a highly fertilising character.

Calendar of Operations.

JANUARY.

BERWICKSHIRE MERSE FARM, *Jan.* 31.—During the past five weeks we have experienced great vicissitudes of weather. A severe frost set in the day after Christmas; and an east wind brought a fall of snow to the depth of a foot here, and far more in Lammermuir, where a subsequent change of wind to the west soon drifted up nearly all the public roads, and put a stop to all traffic. Though we might have wished our ploughing further advanced, so as to give the land the benefit of frost, yet we were glad to get good hard roads for the carting out of our dung—an operation which was performed under very different auspices last season. Where Turnip stores were insufficient, there was much difficulty in obtaining anything eatable for sheep; for roots were frozen hard before the snow fell. In Lammermuir, stock had to be regularly foddered with hay; but people, profiting by dear-bought experience last spring, have a plentiful supply of that article, so essential in the hills. Our deep streams afforded capital skating; and the rapids were choked by ice gradually accumulating on the bottom, while the weather was clear and calm the first week of the new year. A further fall of snow, however, was followed by a driving east wind and rain for two days; and the streams, swollen beyond all bounds by the sudden thaw of accumulated snows, broke up the thick ice in massive blocks, and, getting gorged up at every obstruction, carried away a large mill weir, besides flooding all haughs and barking the Alder trees to a height of 7 or 8 feet above ordinary water mark. This temporary fresh gave place to more snow and frost, but much less severe than before. But at length the wind shifted to the south, and in a single day all the snow had disappeared quietly under a mild and clear sky. Ploughs resumed operations 10 days ago, after lying idle for fully three weeks, and found the land much opened and improved by the unusually penetrating frosts. A thunder-storm which passed up the water on that day has proved the precursor of a series of gales from the south and west, which increase in violence as the day advances, and appear to reach a climax at midnight. They have been accompanied by heavy clouds, and the fluctuations of the barometer have been uncommonly great. Turnip land is now thoroughly dried; and some small breaks have been ploughed and sown in good order. What is up of winter Wheat looks well. Swedish Turnips are turning out better than was anticipated; and they will probably be sufficient to feed off all the stock, with the assistance of an extra quantity of cake and Beans. Feeding hoggs have been healthy since the new year, though making but little improvement. Turnips command extreme rates, 6*d.* per week being now given for cutting Swedes to bred hoggs. The Wheat market has revived after a temporary dulness. Barley and Oats are rising too, especially the latter, which is likely to be scarce. *J. S.*

Notices to Correspondents.

AGRICULTURAL SOCIETY'S JOURNAL: *A New Subscriber.* No 32 is Part II. of last year's volume, to which members of the present year are not entitled.

ANNUAL AVERAGES OF WHEAT. *Inquirer.* We correct our former reply as follows:—1850, 40*s.* 3*d.*—1851, 38*s.* 6*d.*—1852, 40*s.* 9*d.*—1853, 53*s.* 3*d.*

AVERAGES: *M Saul.* Your report was not published, simply because it stated not the average of a district, but (we presume) the average of a farm; 59 bushels of Wheat per acre is incredible if intended as the return for a district, *i. e.*, if the imperial measures were meant: and, if imperial measures were not meant, it was unintelligible—either way, therefore, it was useless to publish it.—*Mark Lane.* The averages given by us are the latest that can be obtained from the official authorities.

BOOK-KEEPING: *D N C.* Read the article on the subject in Blackie's Cyclopedia. That states the principles sufficiently clearly to guide any one to a sound practice.

EGYPTIAN WHEAT: *Anon.* It cannot be procured at under about 64*s.* per quarter of 448 lbs. You can obtain it at Mark Lane on these terms.

MUD: *C G.* Let it drain and dry, then turn it over and make a lime compost with it before using it on the Grass.

MUSH: *H E S* says, add half a tea-spoonful of salt to half a pint of Indian corn meal, gradually mix with a quart of cold milk, or water, boil for 10 or 12 minutes, eat with sugar, molasses, or jam. Another recipe for porridge: Of a spoonful each of Indian meal and Wheat flour, make thin batter, pour it into a a quart of boiling milk and water, salt to taste, boil 10 minutes.

PEAT-DRAINING PIPES: *H W.* They were used, we believe, by the late Mr. Smith, on the Island of Lewis, and he spoke highly of them; but we are not sure of the ultimate result of his operations there.

ROOFED STACK-YARD. *Derby* can see a roofed stack-yard, which also answers the purpose of a cattle-shed, on Lord Berners' property at Tugby, Leicestershire.

SPADE HUSBANDRY: *Clericus.* We presume that you must apply direct to Mr. Yule.

TOP-DRESSING: *H W W.* The manures applied as top-dressing ought to depend on the character of the soil. If the land is poor, guano, soot, nitrate of soda, and other nitrogenous manures, ought to be applied. If it is rich, salt and lime might be useful. We should prefer the English threshing-machine. The best French flour is, we believe, considered superior to the English; but we do not know the cause. Bushe's root-grater, to which you refer, is manufactured in Ireland; they should advertise for themselves.

ERRATUM. In the article on Cattle Feeding, in lieu of the text as it is (p. 59, col. *a*, line 50), please insert, "If we take 5 lbs. of Linseed-cake to be equal in nutritive property to 1 cwt. of Turnips, valued at 9*l.* per ton, the cost of 100 lbs. will be 8*s.*, and will represent the like value per ton of Turnips." The chief object of my former paper was to draw the attention of your readers to the impolicy of giving large supplies of Linseed-cake. I am aware that in some of our principal feeding districts (Norfolk, &c.) it is no uncommon thing to give as much as 12 lbs. per day in the advanced stage of feeding. I am equally opposed to the system of feeding wholly on Turnips, though I have left this more to be inferred by your readers from the data afforded. I am persuaded that if food to fatten be given wholly in Turnips, it will entail a cartage of 6 tons per week more of moisture, or water alone, than is requisite for the wants of the animal; and to those who, like myself, carefully husband the whole of the excrement, solid and liquid, and cart it back by horse to the land, nearly a like additional burden in weight of manure, without any increase in its value. *Y.*

ART UNION OF LONDON (BY ROYAL CHARTER).—Every Subscriber of one Guinea will have an impression of a large plate of deep national and historical interest, "TILBURY FORT: WIND AGAINST TIDE," by J. F. WILLMORE, A.R.A., after C. STANFIELD, R.A. The impression will be ready on the 13th instant. Each Prizeholder will be entitled to SELECT FOR HIMSELF, as heretofore, a work of art from one of the public exhibitions. GEORGE GODWIN, } Hon. Secs.
444, West Strand, Feb. 1. LEWIS POCOCK, }

WESTMINSTER ABBEY OR VICTORY.—NELSON at the BATTLE of ST. VINCENT.—LEGGATT, HAYWARD, and LEGGATT beg to inform their Patrons and Friends that T Jones Barker's last grand historical PICTURE of NELSON RECEIVING the SWORDS from the vanquished Officers on the Quarter-deck of the SAN JOSEF, on the memorable 14th of February, 1797, at the Battle of St. Vincent, is NOW ON VIEW at their Gallery, 79, Cornhill.

Court Circular, Nov. 24, 1853.—Windsor.—"Messrs. Leggatt had the honour of submitting to Her Majesty and His Royal Highness Prince Albert, Barker's painting of Nelson receiving the swords of the officers on the quarter-deck of the San Josef after the battle of St. Vincent."

In consequence of the unfavourable state of the weather, the picture is exhibited by gas-light, and may be viewed from 10 till 6.

TO NERVOUS SUFFERERS.

A RETIRED CLERGYMAN having been restored to health in a few days, after many years of great nervous suffering, is anxious to make known to others the means of cure. Will, therefore, send (free), on receiving a stamped envelope (properly addressed), a copy of the prescription used.—Direct to the Rev. E. DOUGLAS, 18, Holland Street, Brixton, London.

QUALITY THE TEST OF CHEAPNESS.

BERDOE'S OVERCOATS AND CAPES resist any amount of rain. One of the largest Stocks in London of Superior GARMENTS at Lowest Charges. First-Class DRESS COATS, 3*l.*; BOY'S SUIT, 11*d.* per inch, according to height.—96, New Bond Street, and 69, Cornhill. (Nowhere else.)

NO CHARGE FOR STAMPING ARMS, CRESTS, INITIALS, &c., on paper and envelopes, at LOCKWOOD'S well-known establishment, 75, New Bond Street. Good cream-laid Note-paper, five quires for 9*d.*; Thick ditto, five quires, 1*s.*; Albert and Queen's sizes, five quires for 6*d.*, 9*d.*, and 1*s.*; Envelopes, 3*d.* to 1*s.* 6*d.* per hundred; Foolscap paper, 7*s.* 6*d.* per ream; Copybooks, 2*s.* 6*d.* per dozen. Card Plate engraved, 2*s.* 6*d.*; 100 Cards printed, 2*s.* 6*d.* Mourning Stationery equally cheap. Wedding Orders promptly executed. A large variety of Writing and Dressing Cases, Envelope Boxes, Blotting Books, Inkstands, Gold Pens, Church Services, &c. Copy address, LOCKWOOD'S, 75, New Bond Street. Country orders for 20*s.* sent carriage free.

WM. HALSE'S FIVE GUINEA APPARATUSES are now ready.—Invalids are solicited to send to Mr. W. HALSE, of 22, Brunswick Square, London, for his Pamphlet on MEDICAL GALVANISM, which will be forwarded free, on receipt of two stamps. In it will be found the particulars of cures in cases of asthma, rheumatism, sciatica, tic doloureux, paralysis, spinal complaints, headache, deficiency of nervous energy, liver complaints, general debility, indigestion, stiff joints, nervous disorders, &c. Mr. HALSE'S method of applying the galvanic fluid is quite free from all unpleasant sensation. Terms: One Guinea per week. The above Pamphlet contains his Letters on Medical Galvanism.

QUANTITY AND QUALITY OF THE HAIR.

NO TOILET can be considered complete without a careful attention to that department which so materially affects the entire contour, viz., the Hair, which, both in quantity and quality, is susceptible of the most material alteration. That which is weak can be strengthened, and be made to receive a most beautiful gloss by artificial applications. It is to its extraordinary and valuable properties in these respects that is due the character of C. AND A. OLDRIDGE'S BALM OF COLUMBIA, for its invigorating, nutritious, and regenerative qualities. OLDRIDGE'S BALM causes Eyebrows to grow, prevents the Hair from turning grey, and the first application causes it to curl beautifully, frees it from scurf, and stops it from falling off. Price 3*s.* 6*d.*, 6*s.*, and 11*s.* per bottle. No other prices are genuine.—N.B. Ask for OLDRIDGE'S BALM, 13, Wellington Street North, Strand, London.

DO YOU WANT BEAUTIFUL HAIR, WHISKERS, MOUSTACHES, &c.?—ALICE MELVILLE'S PALMAPILLA is the only real remedy ever discovered for preserving and restoring the Hair. In all cases it strengthens weak hair, prevents its falling off, checks greyness, produces a thick and luxuriant growth, dispelling scurf and dandriff, and making it clean, soft, curly, and glossy. For baldness arising from any cause, its operation is certain and effective; and for the production of Whiskers, Moustaches, Eyebrows, &c. in a few weeks, it is the only stimulant that can be depended upon. Price 2*s.* 6*d.* per case. Sent post free to any part of the World, on receipt of 30 penny postage stamps, by Miss MELVILLE, 25, Argyle Square, King's Cross, London. Sold by every Chemist.

MISS MELVILLE'S PURE LIQUID HAIR DYE. Price 2*s.* 6*d.*; post free for 42 postage stamps.

CLOSE OF HOLIDAYS.—The return of Youth to their respective Boarding Schools induces a solicitude from Parents and Guardians for their Personal Comfort and Attraction, and ROWLANDS' MACASSAR OIL, for accelerating the growth and improving and beautifying the hair, ROWLANDS' KALYDOR, for improving the skin and complexion, and removing cutaneous eruptions, and ROWLANDS' ODONTO, or Pearl Dentifrice, for rendering the teeth beautifully white, and preserving the gums, are considered indispensable accompaniments for the attainment of those Personal Advantages so universally sought for and admired. BEWARE OF SPURIOUS IMITATIONS. The only GENUINE of each bears the name of "Rowlands" preceding that of the article on the wrapper or label.—Sold by A. ROWLAND AND SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

CURE OF CHRONIC COUGH, BY DR. LOCOCK'S PULMONIC WAFERS.—From Mr. J. Smedley, Bookseller, Sleaford, Oct. 22, 1853.—Gentlemen,—I can speak with confidence, particularly of the Pulmonic Wafers, with which I have been not only relieved, but cured, of a Chronic Winter Cough. Hundreds of boxes I have sold, and still the sale is as great as ever. Signed J. Smedley.—Dr. LOCOCK'S Pulmonic Wafers give instant relief and a rapid cure of Asthma, Coughs, and all disorders of the breath and lungs. To singers and public speakers they are invaluable, for clearing and strengthening the voice. They have a most pleasant taste. Price 1*s.* 1½*d.*, 2*s.* 9*d.*, and 11*s.* per box.—Sold by all Chemists.

PAINS IN THE BACK, GRAVEL, LUMBAGO, RHEUMATISM, GOUT, INDIGESTION, FLATULENCY, NERVOUSNESS, DEBILITY, &c.

DR. DE ROOS' COMPOUND RENAL PILLS, as their name Renal (or the Kidneys) indicates, are a most safe and efficacious remedy for the above dangerous complaints. For depression of spirits, incapacity for society, study, or business, giddiness, drowsiness, nervousness, and insanity itself, when arising from or combined with urinary diseases, they are unequalled. Price 1*s.* 1½*d.*, 2*s.* 9*d.*, 4*s.* 6*d.*, 11*s.*, and 33*s.* per BOX, through all Medicine Vendors, or sent (free) on receipt of the amount in postage stamps, by Dr. DE ROOS, 35, Ely Place, Holborn, London. At Home for consultation daily from 11 till 1, and 5 till 8, Sunday excepted. Advice and Medicines, 1*l.*

FENDERS, STOVES, AND FIRE-IRONS.—Buyers of the above are requested, before finally deciding, to visit WILLIAM S. BURTON'S SHOW ROOMS, 39, Oxford Stree (corner of Newman Street), Nos. 1 and 2, Newman Street, and and 5, Perry's Place. They are the largest in the world, and contain such an assortment of FENDERS, STOVES, RANGES, FIRE-IRONS, and GENERAL IRONMONGERY as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright Stoves, with bronzed ornaments and two sets of bars, 2*l.* 14*s.* to 5*l.* 10*s.*; ditto with ormolu ornaments and two sets of bars, 5*l.* 10*s.* to 12*l.* 12*s* Bronzed Fenders complete, with standards, from 7*s.* to 3*l.*; Stee Fenders from 2*l.* 15*s.* to 6*l.*; ditto, with rich ormolu ornaments from 2*l.* 15*s.* to 7*l.* 7*s.*; Fire-irons from 1*s.* 9*d.* the set to 4*l.* 4*s* Sylvester and all other Patent Stoves, with radiating hearth plates All which he is enabled to sell at these very reduced charges,

1st,—From the frequency and extent of his purchases; and,

2dly,—From those purchases being made exclusively for cash.

THE PERFECT SUBSTITUTE for SILVER.—The real NICKEL SILVER, introduced 20 years ago by WILLIAM S. BURTON, when Plated by the patent process of Messrs Elkington & Co., is beyond all comparison the very best article next to sterling silver that can be employed as such, either use fully or ornamentally, as by no possible test can it be distinguished from real silver.

The largest stock in existence of plated dessert knives and forks, in cases and otherwise, and of the new plated fish carvers. Also a large assortment of Razors, Penknives, Scissors, &c., of the best quality.

THE BEST SHOW OF IRON BEDSTEADS in the Kingdom is WILLIAM S. BURTON'S.—He has two very Large Rooms, which are devoted to the exclusive show of Iron and Brass Bedsteads and Children's Cots, with appropriate Bedding and Mattresses. Common Iron Bedsteads from 15*s.* 6*d.* Portable Folding Bedsteads from 12*s.* 6*d.*; Patent Iron Bedsteads, fitted with dovetail joints and patent sacking, from 21*s.*; and Cots from 21*s.* each; handsome Ornamental Iron and Brass Bedsteads, in great variety, from 2*l.* 19*s.* to 13*l.* 13*s.*

GAS CHANDELIERS AND BRACKETS.—The increased and increasing use of gas in private houses has induced WILLIAM S. BURTON to collect from the various manufacturers all that is new and choice in Brackets, Pendants, and Chandeliers, adapted to offices, passages, and dwelling-rooms, as well as to have some designed expressly for him; these are now ON SHOW in one of his TEN LARGE ROOMS, and present for novelty, variety, and purity of taste, an unequalled assortment. They are marked in plain figures, at prices proportionate with those which have tended to make his Ironmongery Establishment the largest and most remarkable in the kingdom, viz. from 12*s.* 6*d.* (two lights) to 16*l.* 16*s.*

WILLIAM S. BURTON has TEN LARGE SHOW ROOMS (all communicating), exclusive of the shop, devoted solely to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated and Japanned Wares), Iron and Brass Bedsteads, so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

No. 39, Oxford Street (corner of Newman Street); Nos. 1 and 2 Newman Street; and 4 and 5, Perry's Place.

HEAL & SON'S ILLUSTRATED CATALOGUE of BEDSTEADS, sent free by post; it contains designs and prices of upwards of 100 different Bedsteads, in iron, brass japanned wood, polished birch, mahogany, rosewood, and walnu tree woods; also of every description of bedding, blankets, and quilts.—HEAL & SON, Bedstead and Bedding Manufacturers, 196 Tottenham Court Road.

THE ROYAL EXHIBITION.—A valuable, newly-invented, very small, powerful, waistcoat-pocket Glass, the size of a Walnut, to discern minute objects at a distance of from 4 to 5 miles, which is found to be invaluable for YACHTING, and to SPORTSMEN, GENTLEMEN, and GAMEKEEPERS.

TELESCOPES.—A new and most important invention in Telescopes, possessing such extraordinary powers that some—3½ inches, with an extra eye-piece—will show distinctly Jupiter's Moons, Saturn's Ring, and the Double Stars. They supersede every other kind, and are of all sizes—for the waistcoat-pocket, Shooting, Military purposes, &c. Opera and Race-course Glasses with wonderful powers; a minute object can be clearly seen from 10 to 12 miles distant. Invaluable Acoustic Instruments for relief of extreme Deafness.

Messrs. S. & B. SOLOMONS, Opticians and Aurists, 39, Albemarle Street, Piccadilly, London, opposite the York Hotel.

METCALFE AND CO.'S PERFUMERY DEPARTMENT.—PROPRIETARY ARTICLES.—METCALFE'S celebrated ALKALINE TOOTH POWDER is acknowledged as the safest and most efficient now in use. Dupuytren's Medicated Pomade is the most certain remedy for preventing the hair prematurely falling off, and for restoring it when baldness has already commenced. Dupuytren's Medicated Balm strengthens, cleanses, and improves the growth, and is generally acknowledged as the best wash for the hair.—Manufacturers of British and Importers of Foreign Soaps, Perfumery, and J. M. Farina's genuine Eau de Cologne, at METCALFE, BINGLEY, & Co.'s only Establishment, 130*s* and 131, Oxford Street, second and third doors west from Holles Street.

ATKINSON AND BARKER'S ROYAL INFANTS' PRESERVATIVE.—Mothers, call at your Druggist's and purchase a bottle of the above. It is the best medicine in the world for infants and young children for the prevention and cure of those disorders incident to infants; affording instant relief in Convulsions, Flatulency, Affections of the Bowels, Difficult Teething, &c. &c., and may be given with safety immediately after birth. It is no misnomer cordial! no stupefactive, deadly narcotic! but a veritable preservative of infants! Mothers would act wisely in keeping it always in the nursery.—Prepared only by ROBERT BARKER, Bowden, near Manchester (Chemist to Her Most Gracious Majesty Queen Victoria), in bottles at 1*s.* 1½*d.*, 2*s.* 9*d.*, and 4*s.* 6*d.* each. CAUTION.—Observe the names of "Atkinson & Barker" on the Government Stamp.

GLASS.

THOMAS MILLINGTON, Importer of Foreign Sheet Glass, requests attention to the present Prices of Glass and Stock sizes, which are cheaper and better than those of English manufacture:—

FREEMAN ROE,
HYDRAULIC ENGINEER,
70, trand, and Bridgefield, Wandsworth.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

FRUIT TREES, POULTRY, RABBIT, SHEEP, and CAT FENCING.—Worsted Netting to protect the Bloom of Peach, Nectarine, and other Trees, Flower, or Seed Beds, from Frost, Blight, and Birds, 2 yards wide, 5d. per yard. NEW TWINE NETTING (Tanned if required), 1 yard wide, 1½d. per yard; 2 yards wide, 3d. per yard; 4 yards wide, 6d. per yard; Half-inch Mesh ditto, 2 yards wide, 6d. per yard. TANNED NETTING, 2 or 3 yards wide, 1½d. per yard. ELASTIC HEXAGON GARDEN NET, or Scrim Canvas, 4½d. per square yard. COCOA NUT FIBRE, or Hemp Sheepfolding Net, of superior quality, 4 feet high, 4d. to 6d. per yard. Rabbit Net, 4 feet wide, 1½d. per yard; 6 feet wide, 2½d. per yard; 8 feet wide, 3d. per yard. Each Edge Corded, ½d. per yard extra, suitable for Poultry Fencing. Square Mesh Cricketing Net, fix its full width and length, made of stout cord, 3d. to 4d. per square yard; this is the best article made for fencing, against fowls, cats, &c. Orders by post with post-office order or town reference, punctually attended to. The Trade supplied. Fishing Nets of all kinds in stock. Tents, Marquees, Rick Cloths, Tarpaulin, Lines, Rope, Twine, &c., at W. CULLINGFORD'S, 1, Edmund-terrace, Ball's Pond-road, Islington, London.

CUCUMBER AND MELON BOXES AND LIGHTS.—One hundred 1, 2, and 3-light Boxes and Lights of all sizes, ready for immediate use. Warranted best materials, packed and sent to all parts of the kingdom: 2-light Boxes and Lights from 1l. 6s. Garden Lights of every description, Conservatories, Green and Hothouses made and fixed in all parts of the kingdom. References given to the nobility, gentry, and the trade, in most of the counties in England.—JAMES WATTS, Hothouse Builder, Claremont Place, Old Kent Road, London.

THE VINE DISEASE EFFECTUALLY CURED BY WATSON'S BLIGHT EXTERMINATOR AND PREVENTIVE. For present application to Grape Vines, Fruit Trees, &c.—Price 2s 6d. per bottle. Sold by H. WATSON, 198, Shoreditch; W. DENYER, 82, Gracechurch Street; and by all Florists and Seedsmen.

WILLIAM MASTERS AND SON, LANDSCAPE GARDENERS, respectfully solicit commissions for the arrangement and improvement of Parks, Plantations, and Gardens. Having an extensive collection of Ornamental Trees, Shrubs, Coniferæ, and Evergreens, among which will be found the newest introductions, they are enabled to treat with Gentlemen on the most liberal terms by contract or otherwise.
Exotic Nursery, Caterbury.

THE COTTAGER'S STOVE.—An economical, compact, and portable COOKING APPARATUS, combining a good sized Oven and Hotplate; may be had with or without a boiler, and will cook sufficient for a dozen persons with the consumption of 1 lb. of coal or coke per hour. It requires no fixing, may be placed in any apartment, and is a great security against accidents from fire. It will burn Coal, Coke, or Wood. They are also specially adapted for Emigrants, and may be seen in operation daily, at the Manufacturers', D. & E. BAILEY, 272, High Holborn, London.—Price 50s., and upwards.

GREAT SAVING OF TIME AND MONEY.

R. RESTELL'S PATENT ECONOMICAL GAS APPARATUS for Forcing Houses, Greenhouses, Conservatories, Pits, Shops, Counting Houses, Warehouses, Drying Rooms, &c. &c., possessing all the advantages of Hot Water at half the expense of fitting, and most trifling cost for Gas, far surpassing any ordinary Gas Stove, requiring no furnace, and allowing of no fumes or evaporation in the Building, or possibility of accidents from negligence or carelessness. It has been tested through the late severe weather, on a variety of Plants, and found most satisfactory. It is very quickly fitted up and requires no night attention.—Apply to the Inventor and Patentee, R. RESTELL, 35, High Street, Croydon, Surrey.
Persons wishing to have Houses fitted will please to send the height and dimensions.

FIRE ANNIHILATOR, OR VAPOUR FIRE ENGINE.—Its practical value proved incontestably by 23 remarkable cases of successful use. See "Bradshaw" of last month, p. 132. Engines for Dwelling-houses, 3l. to 4l.—Office of the Fire Annihilator Company, 105, Leadenhall Street, London.

THE BEST FOOD FOR PIGS.

RICE MEAL is now acknowledged to be the best and cheapest FOOD FOR PIGS. References can be given to the largest feeders in England, and to several who won prizes at the last Smithfield Cattle Show. In order that small consumers may test its merits, 4 cwt. of Rice Meal will be sent for Post-office order of 2l. 2s., including sacks.
RICE MEAL ... ... 9l. per ton.
JAMES MAY & Co., Finsbury Wharf, City Road Basin, London.
Delivered to any Railway in London.
1s. 6d. each charged for Sacks.

A BARGAIN TO PERSONS PLANTING.

TO BE SOLD, a quantity of large EVERGREENS; the ground must be cleared:—Cedar of Lebanon, Sweet Bays, Evergreen Oaks, China Arbor-vitæs, Laurestinus. Delivered free within 10 miles of London.—G. C. LEWIS SOLOMONS, Covent Garden Market.

TO BE SOLD, a SEED BUSINESS in one of the principal towns in the North of England. The premises are situated in the best business part of the town, are extensive and calculated for carrying on a large trade.—For further particulars, or to treat, apply, with real name and address, to A. Z., Office of this Paper. N.B. A Nursery Stock may also be had at a valuation, if desired.

DENYER'S NURSERY, celebrated for ROSES, &c., Established 26 years, consisting of Five Acres of Land, House and Seed Shop attached, of which a 14 years' Lease will be granted. The Proprietor being about to retire, is desirous of offering the above, as an opportunity that rarely occurs to the trade, with a first-rate ready-money connexion, and the Stock to be taken at a valuation, two-thirds to be paid on taking possession; time will be given to pay the balance. No Goodwill is expected.—Apply to Messrs. PROTHEROE & MORRIS, Leytonstone, Essex; or Mr. E. DENYER, on the premises, Loughborough Road, Brixton, within three miles of London.

TO BE SOLD, a splendid BLACK PEACOCK, 3 years old; also a pair of common coloured and same age.—Apply to Mr. M. TRUMPER, Tenbury.

CLEAR BUFF COCHIN CHINA FOWLS' EGGS may be had of Mr. GILBERT, Wine Merchant, Grays, Essex, from Hens bred by Thomas Sturgeon, Esq., in 1852, and reserved for stock at 16s. per dozen. They are unequalled for beauty, plumage, short legs, and great weight, with perfect clear golden hackle, and many of them falcon hockled. Also 50 very splendid first-class PULLETS for sale, nearly all clean in hackle. May be seen at any time.

EGGS FROM FIRST PRIZE STOCK.

W. G. K. BREAVINGTON begs to offer EGGS from his Prize Aylesbury Ducks, from the Dorkings which took first Prize at Southampton and Surrey Gardens mixed with some of Mr. Boys' stock, and a set of young Birds with which Capt. Hornby has just taken second Prize at Manchester; first Prize Cockerel, purchased of him regardless of cost; together with the Hen with which W. G. K. B. obtained second Prize (for *the best* hen) at the Baker-street Exhibition, and a few others of the same strain; from his Silver Buff Cochins, very light and beautiful, *commended at Birmingham*. All orders booked and executed in *strict rotation*. The Eggs will be sent out as soon as a sitting of 12 is laid. W. G. K. B. will guarantee the Eggs to be quite *fresh and perfect* when he packs them, which he will do with the utmost care. Price three guineas per dozen. Post-office orders payable to WILLIAM G. K. BREAVINGTON, Sutton, near Hounslow, Middlesex.
A set of Prize White Cochin Bantams, very heavily feathered, and a set of Prize Pencilled Hamburghs for sale, 3l. 3s. each set.

TO AMATEURS.

TO BE SOLD, FANCY FOWLS AND EGGS.—Pure-bred Malays, that took prizes at Great Yarmouth and Norwich; White-faced Spanish, Progeny of Birds advertised in the *Times*, with challenge of 50l. to produce 12 to match them; Cochins, short-legged and well-feathered.—Address, J. C. DOWSING, Great Yarmouth.

CLEAR YELLOW COCHINS.—Eggs may be had from four pullets of "Sturgeon" blood, running with a cock bred by Mr. Fairlie, all pale yellow birds; 10s. per dozen package included. Eggs from "commended" Spanish birds at the same rate.—E. T. A, Loddon, Norfolk.

GOLDEN SPANGLED HAMBURGH.—Eggs from Prize Birds may be obtained on application to Mr. TAYLOR, Godalming, Sussex.

TO BE SOLD, several first-rate DORKING COCKERELS.—For particulars address (inclosing a prepaid envelope), WILLIAM POPE, Compton Pauncefoot, Castle Carey.

COCHIN CHINA.

TO BE SOLD, a Lemon-coloured Cock, a Prize Bird at Exeter, Honiton, and Torquay. Price Three Guineas. A Cockerel, same colour, a Commended Bird as a Chicken. Price One Guinea.—Apply to Mr. HEAD, The Briars, Alphington, Exeter.—Feb. 4, 1854.

FOWLS.

TO BE SOLD, the EXTRA STOCK of a Gentleman whose Poland Fowls have taken first-class prizes at the Birmingham, Metropolitan, London Summer, Cheltenham, Hitchin, &c., Shows, consisting of white, golden, silver, and black bearded Polands. Cockerels, 30s. each; hens, 2l. 10s.; yellow Polands, 4l. each; white Spanish and frizzled cockerels, 1l. 1s.; hens, 1l. 10s.; buff Cochins, and white silk bantams, 15s. each; prize white guinea fowls, 10s. each.—Apply by letter to G. V., Mr. Ridgway's, 169, Piccadilly, London.

TO NOBLEMEN, GENTLEMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. Cutbush, to Sell by Auction, on the premises, Barnet Nurseries, Middlesex, on THURSDAY, Feb. 9th, at 11 o'clock, without reserve, in consequence of a portion of the land being purchased by the Magistrates of the County of Middlesex for the erection of stables for the militia, the whole of the NURSERY STOCK growing on the two acres, consisting of Ornamental Fruit and Forest Trees, Evergreens and Deciduous Shrubs, Standard and Climbing Roses, Box Edging, &c.—May be viewed prior to the Sale. Catalogues may be had on the premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

LAMBETH.

TO NOBLEMEN, GENTLEMEN, AND THE TRADE.

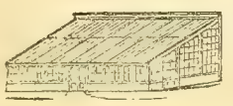
MESSRS. PROTHEROE AND MORRIS are Instructed by Messrs Hay, Sangster and Co. to Sell by Auction, on the Premises, Pleasant Place, West Square, Lambeth, without the least reserve, on MONDAY, February 6th, at 11 o'clock, the whole of the NURSERY STOCK, consisting of Dwarf Trained and Untrained Peach, Nectarine, Apricot, Standard and Dwarf Apple, Pear, Plum, Cherry, China Arbor-vitæs, and Evergreen Oaks, in pots, 2 to 5 feet; Green and Variegated Holly, 3 to 7 feet; Aucuba Japonica, Arbutus, 1 to 3 feet; Cypress, 4 to 6 feet; Common Laurels, 3 feet; Filberts, Gooseberries, Currants, Raspberries, Weeping Elms, Willows, and Ash, Standard and Dwarf Roses, Bedded Pear Stocks, Seakale, and Giant Asparagus, Vines in pots, Box Edging, Sangster's New Early Scarlet Rhubarb (Prince of Wales), which no garden should be without; also the large Stock of thrifty grown Standard Dwarf and Dwarf Trained Mulberries, for which Messrs. H. S. and Co. have been so justly celebrated. A large quantity of rotten Dung, &c.—May be viewed prior to the sale; Catalogues may be had (6d. each, returned to purchasers) on the premises; of the principal seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.



The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

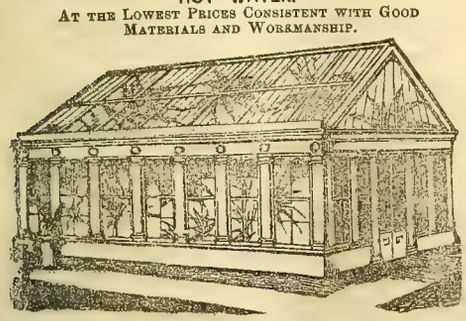
BY HER MAJESTY'S ROYAL LETTERS PATENT.

E. DENCH, PATENT HOTHOUSE WORKS,
KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1*s.* 3*d.* per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8*d.* per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.
AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of E. T. ARCHER, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application.

HORTICULTURAL BUILDINGS, ROCK AND RUSTIC WORK, ORNAMENTAL WATER, FOUNTAINS AND FALLS, AND LANDSCAPE GARDENING, executed on the best principles; Estates Improved, Land Laid Out for Building, &c., by Mr. GLENNY, Valuer, Estate and Horticultural Agent, 420, Strand.

COLE'S SUPERB CRYSTAL WHITE CELERY.

J. THORNLEY, W. COLE, AND Co., NURSERYMEN, SEEDSMEN, and FLORISTS, Withington, Manchester, beg to announce that they are now prepared to supply this fine Celery at 1*s.* 6*d.* per half-ounce packet, or in larger quantities. This variety has given universal satisfaction, and has been proved to possess all the good qualities attributed to it by W. Cole last season. It can also be procured from the following agents:—

Messrs. Hurst and M'Mullen, 6, Leadenhall Street; Messrs. Noble, Cooper, and Bolton, 152, Fleet Street; Messrs. Minier & Co., 60, Strand; Messrs. Charlwood & Cumming, Covent Garden; Mr. Turner, Slough; Mr. Duncan Hairs, St. Martin's Lane; Mr. Denyer, Gracechurch Street; Mr. J. Fairbairn, Clapham; Messrs. A. Henderson & Co., Pine Apple Place; Messrs. Downie and Laird, Edinburgh; Messrs. F. & A. Dickson, Chester; Messrs. F. & A. Dickson, Manchester; Messrs. J. & J. Fraser, Lea Bridge, Essex; Messrs. Little and Ballantyne, Carlisle; Messrs. Veitch & Son, Exeter; Mr. J. Veitch, Exotic Nursery, Chelsea; Mr. Clarke, King Street, Covent Garden; Messrs. Finney & Co., Gateshead; Mr. A. Pontey, Plymouth; Mr. E. Rendle, Plymouth; Mr. Cattell, Westerham, Kent; Mr. Smith, Riverhead, Kent; Mr. Epps, Ashford and Maidstone, Kent; Messrs. Lucombe, Pince, & Co., Exeter; Mr. Browne, Norwich; J. Cole, Keyfield Nursery, St. Albans; Garaway & Mayes, Bristol; Drummond & Son, Stirling.

All orders to be addressed as above, instead of to "Dartford" as heretofore.

TRUE HIGHLAND PINE FIR, 1½ to 2 ft., 20*s.*; 2 to 3 ft., 25*s.* per 1000. The Seed from Braemar Forest.—Apply to WILLIAM JACKSON & Co., Bedale, Yorkshire.

SELECT FRUIT TREES.—Per dozen.—Apples and Pears, of the most approved kinds, good strong standards, 9*s.* Ditto, ditto, dwarfs, 8*s.*; trained, 24*s.* to 30*s.*

Cherries and Plums, good strong standards, 12*s.* Ditto, ditto, dwarfs, 9*s.*; trained, 36*s.*

Horse Chestnut, 3 to 4 ft., 40*s.* per 100. Ash, 3 ft., 15*s.* per 1000. Sycamore, 2 ft. 15*s.* per 1000.

Hardy Herbaceous Plants (each sort by name), purchasers' selection, 35*s.* per 100. Shrubs, flowering and evergreen, 30*s.* per 100, purchasers' selection, our selection 25*s.* each. Vegetable and Flower Seeds of the best quality, see advertisement in the *Gardeners' Chronicle*, January 28.

Address all orders and communications to HENRY MAY, the Hope Nurseries, near Bedale, Yorkshire.

THE CHAMPION PEACH.

THOMAS HUTCHINGS, NURSERYMAN, &c. AXMINSTER, is now sending out this beautiful Seedling Peach, which far surpasses everything of the kind ever offered to the Public, measuring the extraordinary size of from 11 to 13, and sometimes 14 inches—flesh free, rich, and juicy; flavour unequalled—somewhat resembling the Green-gage Plum—an excellent bearer—and in every respect of first-rate quality.

Trained Trees ..... £1 1*s.* 0*d.*
Maiden ditto ..... 0 10*s.* 6*d.*

It is respectfully requested that all orders from unknown correspondents be accompanied by a Post-office order, payable at Axminster, Devon.

TESTIMONIAL.

"Sir,—I have fruited the Champion Peach, and have proved it to be *quite equal* to the description, and well worthy the name given it. I am ready to answer any inquiry that any lady or gentleman may wish to make.—I am, Sir, yours respectfully,

"JOHN REYNOLDS,

"To Mr. Hutchings. "Belmont, Lyme Regis, Dorset."

Orders received at the Nursery, or by Messrs. Hurst and MacMullen, 6, Leadenhall-street, London; and by Messrs. Garaway, Mayes, and Co., Durdham Down Nurseries, Bristol.

January, 1854.

TO NOBLEMEN, GENTLEMEN, AND COMPANIES PLANTING.

THOMAS JACKSON AND SON respectfully invite an inspection of their extensive and fine collection of ORNAMENTAL SHRUBS and TREES; they are of fine growth, and in excellent condition for planting for immediate effect. To the undernamed T. J. & Son especially desire attention. Prices may be obtained by letter or personal application.

American Arbor-vitæ, 2 to 10 ft.
Chinese do., 2 to 8 feet, fine

Red Cedars, 3 to 5 feet, fine

T. J. & Son having added to their previously good stock of American Plants, about one-third of the entire stock of the Norbiton Nursery, so long famed for its collections of Hybrid Rhododendrons, Azaleas, &c., can now offer on most advantageous terms—

Rhododendron ponticum, 1 to 5 ft., in great variety.
Do. aureum, and the varieties of yellows, 1 to 7 ft.
Do. Smithi, tigrinum, and other scarlets, 1 to 9 ft.
Do. campanulatum and light varieties, 1 to 7 ft.
Azaleas, Indian, American, and Ghent varieties, 1 to 6 ft.
Kalmia latifolia, and others, 1 to 4 ft.

T. J. & Son have a splendid healthy stock of the Sikkim Rhododendrons, of which they will furnish the 12 following fine kinds, in pots, for 63*s.*, viz., Thompsoni, fulgens, glaucum, glaucum nanum, niveum, Falconeri, ciliatum, Edgeworthi, lancifolium, cinnabarinum, ferruginosum, and calycatum.

Fine Fruit and Forest Trees; strong Quick for Fences, and all other kinds of Nursery Stock.—Nurseries, Kingston, near London.

CHOICE SEEDS.

BASS AND BROWN'S SPRING CATALOGUE FOR 1854 is now in the Press. The Part containing the SEEDS can be forwarded immediately, on application, for two penny stamps.

PEAS, FINE NEW KINDS, of last and present year's introduction.

Fairbeard's Nonpareil, earlier than Champion of England, and fine rich flavour	5*s.* 0*d.* per quart.
Waite's Daniel O'Rourke, very early	2 6 "
Sangster's New No. 1, 2½ ft., very early, prolific and fine pods	2 0 "
Stuart's Paradise, 4ft., a very fine large long-podded marrow, three weeks before Thurstone's Reliance, or other Peas of the same character	2 0 "
Hairs' Defiance, 4 ft., a fine new wrinkled marrow	2 0 "

The three last mentioned were grown last season by ourselves, and we can recommend each as an acquisition. Sangster's No. 1 and Stuart's Paradise will be included in the collections below.

BASS AND BROWN'S ASSORTED COLLECTIONS OF VEGETABLE SEEDS, comprising the best in cultivation, including several new sorts of excellent quality.

	£ *s.* *d.*
No. 1.—Collection for a large garden, containing 20 quarts Peas, in 20 best sorts, and all other vegetable seeds in proportion, for one year's supply...	3 0 0
No. 2.—Collection in smaller proportions	2 0 0
No. 3.—Collection do. do.	1 5 0
No. 4.—Collection of good kinds for a small garden ...	0 15 0

Copies of the Autumn Catalogues may still be had for three penny stamps.

Goods (not under 20*s.*) carriage free to all stations in London.

Seed and Horticultural Establishment, Sudbury, Suffolk.

JOHN CATTELL begs to say that the following priced Catalogues of his Nursery Stock and Seeds may be had on prepaid application, by enclosing a penny stamp for each.

Roses, Fruit Trees, Forest Trees, including Quick, Privet, Briar, Holly, &c., suitable for hedges; Hardy Ornamental Trees and Shrubs, including Coniferæ, American Plants, Climbers, &c. Kitchen Garden Seeds. Flower Seeds, in which are enumerated very superior selections of German Stocks, Asters, &c., genuine as imported, in large or small packets, to suit all purchasers.

The following selections are exceedingly fine:—Cedar of Lebanon, from 2 to 8 feet, splendid upright plants, in first-rate order for removal. Cedrus deodara, fine, from 1 to 8 feet. Azaleas, Ghent and English, of the most showy varieties, loaded with bloom buds. Rhododendrons, of all the leading sorts. Kalmia latifolia, in variety, very fine. Andromeda floribunda, splendid plants. Roses, the standards are particularly straight strong stems, also some extra tall stems from 5 to 6 feet, worked with climbing and other showy sorts; the dwarfs are also fine strong plants. Fruit Trees, consisting of the leading varieties, fine and in good order.—Westerham, Feb. 4, 1854.

WHEELER'S SHORT SELECT SEED LIST.

J. C. WHEELER AND SON'S SEED LIST *is now ready, and will be forwarded free on application. We have tried to make it as short and as select as possible, leaving out the names of all inferior varieties, so that it is really a List of the best Seeds in cultivation. Grasses and other Agricultural Seeds, Garden and Flower Seeds, all described, and prices put to every article. We deliver our Seeds Carriage Free to almost every Railway Station in the kingdom, and take especial care that every sort we send out is true to name, and of the best quality.*

J. C. WHEELER & SONS, Seed Merchants, Gloucester.

"THE CATALOGUE of SEEDS sold by J. C. WHEELER AND SON, of Gloucester, appear to us to deserve notice, because of the stand which its authors make, in common with ourselves and others, against the useless incomprehensible Seed Lists of the day. In this, as in all matters of taste, there will be a difference of opinion as to the relative qualities of varieties; yet the mass of buyers who have no fancies, but who dislike being perplexed, and are satisfied with what is excellent, will greatly prefer a short, select Seed List to an interminable labyrinth of names, which, for the most part, represent non-entities or rubbish. Messrs. WHEELER'S little book will do something to satisfy their expectations."—*Gardeners' Chronicle.*

RENDLE'S PRICE CURRENT.—*Opinion of Mr. James Barnes, the well-known Gardener to the Right Honourable Lady Rolle, Bicton:*—

"Dear Sir,—Your Price Current has just come safe to hand, and I beg to return my best thanks for the same. It contains a great deal of useful information for all classes, more particularly for the Amateur and those who cultivate their own Gardens and Allotments.—Yours, &c. "JAMES BARNES."

RENDLE'S PRICE CURRENT.—*Opinion of Mr. W. Tillery, Gardener to His Grace the Duke of Portland, Welbeck:*—

"My dear Sir,—I beg to return many thanks for the copy of 'Rendle's Price Current and Garden Directory for 1854.' As far as my experience goes, I think your Calendar of Operations excellently planned, and the Directions are judicious and quite up to the mark for the present progressive period. The remarks on the systematic rotation of vegetable cropping are likewise excellent and will do much good if carefully put into force.—Yours truly,

"To Mr. Errington. "W. TILLERY."

RENDLE'S PRICE CURRENT *has been already favourably noticed by the following Newspapers and Magazines:*—

"Mark-Lane Express," "The Lady's Newspaper and Pictorial Times," "The Florist, Fruitist, and Garden Miscellany," "The Gardener's and Farmer's Journal," "The Agricultural Magazine," "The Plough," "Lloyd's Weekly Newspaper," "Plymouth Herald," "Exeter Gazette," "Bristol Mercury," "Western Luminary," "Somerset County Herald," "The Clerical Journal," "Cornish Telegraph," "Plymouth Mail," "Devonport Telegraph," "Somerset Gazette," "Western Courier," "Teignmouth Gazette," "West Briton," "Portsmouth Times," and "Naval Gazette," and several other newspapers and Magazines.

SUPERB LATE WHITE BROCCOLI—"EMPEROR."

EDMUND PHILIP DIXON having purchased the entire stock of the above Broccoli of Messrs. Ellerson, Market Gardeners, Thorngumbald, near Hull, begs to announce that he is prepared to send it out in sealed packets at 2*s.* 6*d.* each. This Broccoli has been raised by the Messrs. Elletsons, the raisers of the Mammoth, sent out some time ago, who state that the EMPEROR, if sown at the same time, will come into use before it. Is of very dwarf growth, perfectly hardy, with heads from 15 lbs. to 20 lbs. weight; keeps its colour, and stands firm three weeks after it is ready to cut. A noble flower and commands the best price of any other in the Hull market, where it is well known, and will be a great acquisition to the market gardeners around London, as well as those who wish for a first-rate Broccoli.

May be had of Messrs. NOBLE, COOPER, & BOLTON, 152, Fleet Street; and Messrs. HURST & M'MULLEN, 6, Leadenhall Street London. Also of the Advertiser, 57, Queen Street, Hull.

4, GREAT RUSSELL STREET, COVENT GARDEN, 1854.

JOHN KERNAN,

IN OFFERING TO HIS FRIENDS AND THE PUBLIC THE ANNEXED

LIST OF VEGETABLE AND FLOWER SEEDS,

WHICH INCLUDES EVERY NOVELTY INTRODUCED UP TO THE PRESENT SEASON,

BEGS TO ASSURE HIS CUSTOMERS THAT HE HAS SPARED NO TROUBLE IN SECURING EVERY ARTICLE AS GOOD AS IT COULD POSSIBLY BE PROCURED.

☞ *From the unfavourable weather in the late harvest, many articles are in short supply.*

Rivers' new edition of the "Rose Amateur's Guide," 6s.
Rivers' new Fruit Catalogne, 6d. [distribute to cottagers.
Paxton's "Cottage Calendar," 3d., which ladies and gentlemen should
Collections of 24 Annuals, mixed, recommended by Dr. Lindley as suitable for Shrubberies, 5s. [on the most liberal terms.
Seeds for distribution by Gentlemen to their Tenants and Cottagers
24 papers of Hardy Annuals, 5s.
Seeds selected and carefully packed for Australia, North and South America, India, and New Zealand, in the most secure way to arrive safe at any of the above places.

Ladies and Gentlemen relying upon the judgment and experience of JOHN KERNAN, instead of being supplied (as is often the case) with what is neither useful nor ornamental, may depend upon having a selection of the most useful and indispensable Vegetables to any amount named, by the parties forwarding him their orders. The same economy will be observed in the choice of Flower Seeds. J. K. feels it almost needless to observe that the liberality of discount will be with the amount.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn Place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church Row, Stoke Newington, both in the County of Middlesex, Printers, at their Office, in Lombard Street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles Street, in the Parish of St. Paul's, Covent Garden, in the said County, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, FEBRUARY 4, 1854.

GENUINE NEW CLOVER SEED *may be obtained of the undersigned. Prices (according to market and quantity required) will be forwarded on application.* JOHN SUTTON & SONS, *Seed Growers, Reading, Berks.*

GERMAN FLOWER SEEDS.

H. HENKEL, 70, Fenchurch Street, London, sole agent in England for Messrs. Moschkowitz & Siegling, of Erfurt, Prussia, begs to inform the Trade that he keeps always on hand a stock of the most choice GERMAN FLOWER SEEDS, in the original sealed packets, a Priced List of which will be forwarded free by post on application. Also a complete Wholesale Price List of Agricultural, Kitchen Garden, and other Seeds. 70, Fenchurch Street, London.

THE BLACK BARBAROSSA,

"A GRAPE THAT DON'T KNOW HOW TO SHANK."

JOHN BUTCHER has fine fruiting plants, 10*s*. 6*d*.; good plants, 5*s*. 6*d*., may be obtained of the above splendid Late Grape. London Agent, Messrs. DAWE, COTTRELL & BENHAM, 36, Moorgate Street, and JOHN BUTCHER, Nurseryman, Stratford-on-Avon.

SUPERB DOUBLE HOLLYHOCKS.

WILLIAM CHATER has now ready a fine healthy stock of young plants of all the leading sorts. For price and description see General List, which also contains hints on their culture, with observations on the exhibition of Hollyhocks, &c. &c., and may be had by inclosing a postage stamp. Saffron Walden Nursery, February 11.

JUDSON'S RICHMOND VILLA BLACK HAMBURGH VINE.

ARTHUR HENDERSON AND CO. have the pleasure of informing their patrons and friends that they have good plants of this valuable and much-esteemed Vine at 5*s*. each; extra strong plants, 7*s*. each.—N.B. For full particulars of the distinguishing characteristics of this Vine, we beg to refer our customers to the *Gardeners' Chronicle* of October 25th, 1851.

HIGHGATE NURSERIES, NEAR LONDON.

JAMES CUTBUSH, with deep regret, begs to inform his Customers and the Public generally of the sudden and lamented death of his Father (WILLIAM CUTBUSH), and offers his sincere thanks for the kind and extensive Patronage he received for upwards of 33 years. J. C. also acquaints them that the business will be conducted as hitherto under the name of "WM. CUTBUSH & SON" by himself, and humbly solicits a continuance of their esteemed favours; and by unremitting attention hopes to merit their support and recommendation.

SEA-SIDE PLANTING. THE BLACK AUSTRIAN PINE.

LUCOMBE, PINCE, AND CO., have a fine, healthy, well-rooted Stock of this most serviceable hardy Pine, which, for planting in maritime situations and bleak exposed places generally, entirely supersedes all other trees. In sizes from 9 inches to 2½ feet high.

L. P. & Co. have also an extensive Stock of all sorts of Forest Trees, Hardy Shrubs, Fruit Trees, Coniferæ, &c., which they beg leave to offer on very reasonable terms. For prices and particulars, apply to them at the Exeter Nursery, Exeter.

PELARGONIUMS, SEEDS, ETC.

JOHN DOBSON begs to announce that his Descriptive Catalogues of the following are now ready, and may be had in exchange for one postage stamp each:—A Catalogue of Pelargoniums, containing every good show variety; a Catalogue of Seeds, containing short but select collections in the several classes; a General Catalogue, containing all the best varieties of Fancy Geraniums, Pansies, Fuchsias, Antirrhinums, &c. &c.

Twelve strong Plants of the best show Pelargoniums for 42*s*., hamper and package included; Antirrhinum Seed, very choice, 6*d*. per packet; and Cockscomb Seed, from flowers 23 inches over, 1*s*. per packet.—Woodlands Nursery, Isleworth, Middlesex.

THE FINEST BALSAMS IN EUROPE, in Six Classes; Seed saved by Mr. GLENNY from flowers three inches across: the six, 37 stamps; Mixed Seeds, 13 stamps, in Sealed Packets only, signed and sealed. The finest seeds that can be had procured to order, and all other choice Horticultural subjects.—420, Strand.

RENDLE'S NEW PRICE CURRENT FOR 1854 *should be obtained by all who have gardens, whether small or large. It will be found to be a correct and useful Guide to the amateur and young gardener; a remembrancer to the more advanced in horticulture, and a source of reference to all.*

Can be obtained from the London Publishing Office, 294, Strand; or from the Proprietors, WILLIAM E. RENDLE & Co., Seed Merchants, Plymouth. ESTABLISHED 1786.

WM. HAMILTON (late of Cheapside), SEEDSMAN and FLORIST, 41, Margaret Street, Cavendish Square (first door from Regent Street), London, begs to announce that his Descriptive and Priced CATALOGUE will be forwarded by post on application. It contains an excellent assortment of VEGETABLE SEEDS, and gives a description of their quality and uses; a select choice of FLOWER SEEDS, and the new varieties, with their English or popular names; a list of the finest ROSES and the best CARNATIONS AND PICOTEES for Exhibition; NEW AND RARE PLANTS, FRUIT TREES, and other articles essential for the Garden. All orders sent to W. H., whether by post or otherwise, are carefully and promptly attended to.

CHARLES ALEXANDER (late of DICKSONS & Co.), SEEDSMAN and FLORIST, 32, West Register Street, Edinburgh. His Descriptive Catalogue of Select Garden and Flower Seeds is just published and will be forwarded free on application.

E. SPARY, NURSERYMAN, FLORIST, and SEEDSMAN, respectfully announces that his CATALOGUE of Dahlias, Chrysanthemums, Fuchsias, Geraniums, Verbenas, Stove and Greenhouse Plants, Vines, Seeds, &c., &c., may be had on application.—Queen's Graperies, and 176, Western Road, Brighton.

SAMUEL FINNEY AND CO.'S DESCRIPTIVE CATALOGUE OF FLOWER AND VEGETABLE SEEDS, with prices, is now ready, and may be had on application. It contains an extensive assortment of Imported German Flower Seeds, the celebrated French Asters, and many splendid novelties.—Gateshead Nursery, February 11.

STANDISH AND NOBLE'S CATALOGUE for the present season is Now Ready, and may be had on application. A selection from it appeared as a detailed advertisement in the *Gardeners' Chronicle*, of Saturday, Sept. 10th, to which they respectfully refer plant buyers. It contains many new and choice plants.—The Nursery, Bagshot, Surrey, Feb. 11.

AMERICAN PLANTS.

JOHN WATERER begs to announce that his NEW CATALOGUE of RHODODENDRONS, AZALEAS, CONIFEROUS PLANTS, &c., is now published, and may be had by enclosing two stamps for postage.

The colours of all the Rhododendrons worthy of cultivation are described in order to facilitate purchasers in making selections, together with a Treatise on their successful management.

☞ The Rhododendrons forming the American Exhibitions in the Royal Botanic Society's Garden, Regent's Park, London, are annually supplied from this establishment.

The American Nursery, Bagshot, Surrey, near the Farnborough Station, South-Western Railway, and 3 miles from Blackwater, South-Eastern Railway.

GEORGE BAKER begs to say that his DESCRIPTIVE CATALOGUE of AMERICAN PLANTS, CONIFERS, ORNAMENTAL SHRUBS, FRUIT and FOREST TREES, &c., may be had by enclosing two postage stamps.

G. B. wishes to call particular attention to his fine Stock of GREEN and WEEPING HOLLIES, from 1 to 12 feet high.

G. B. has supplied the American Exhibition in the Royal Botanic Gardens, Regent's Park, from its commencement.

American Nursery, Windlesham, near Bagshot, Surrey, about six miles from Staines Station, Windsor Branch, South-Western Railway, where conveyances may be obtained.

FUCHSIA "DUKE OF WELLINGTON."—Full description sent on application, or coloured Lithographs for 24 stamps. Plants on April 20th, 10*s*. 6*d*. each. Orders executed in strict rotation.—J. MOORE & SON, Perry Barr Nursery, near Birmingham.

BLACK PRINCE AND PRINCE OF WALES STRAWBERRIES.—The Prince of Wales, per 100, 12*s*.; Black Prince, 5*s*. per 100. Also Cuthill's third thousand of the Belgian Prize Essay on the Potato, with 20 other articles upon the Melon, Cucumber, Strawberry, Asparagus, Seakale, Rhubarb Wine (which makes the finest champagne), Salads, Herbs, &c. Price 2*s* 4*d*., post free. Also, Market Gardening round London, Price 1*s*. 8*d*. post free. Cucumber Seed, 1*s*. 1*d*. per packet. A Youth from 17 to 18 wanted.

JAMES CUTHILL, Camberwell, London.

CHOICE FRUIT TREES.

JOHN ADAMS, NURSERYMAN AND SEEDSMAN, Brompton Park, Kensington Gore, London, begs to call the attention of the trade, and planters generally, to his extensive Stock of FRUIT TREES, embracing all the best varieties in cultivation, under their correct nomenclature; but more particularly to his Standard Trained Cherries, Plums, Pears, Apricots, Peaches, and Nectarines; Dwarf Trained Cherries, Pears, Plums, Peaches, and Apples; Standard Cherries, Plums, Pears, and fine large Mulberries; Dwarf Pears, Plums, Apples, and Nectarines, of which he has a large stock, all of first-rate quality.

A LARGE QUANTITY OF ONE AND TWO YEAR SEEDLING LARCH, FIR, AND OTHER SEEDLINGS.

WILLIAM WOOD AND SON have the pleasure of referring their Friends to the above, prices of which may be obtained on application.

SEEDLINGS—Two-year Scots Fir, ditto Pinus Austriaca.

One-year Pinus pinaster, ditto Cherry and Pears, very fine, ditto Ash and Alder, ditto Sycamore and Hornbeam, and two-year Weeping Birch. Also Bedded Larch, very fine, and strong transplanted Spruce and Silver Fir, all on the most moderate terms.

N.B. A large stock of Standard and Pyramid Pears, also Standard Plums and Cherries.

Woodlands Nursery, Maresfield, near Uckfield, Sussex.

SEEDS.

W. AND S. GAINES beg to offer to Gardeners, Farmers, and Nurserymen, the following seeds:—WHITE SPANISH ONIONS, 4*s*. 6*d*. per lb.; Deptford do., 4*s*. per lb.; Reading do., 4*s*. 6*d*. per lb.; quantities not less than 1 lb. The above are first-rate; persons in want should apply as soon as possible to WILLIAM JACKSON & Co., Bedale, Yorkshire.

GRASS SEEDS, SEPARATE OR MIXED.

GENTLEMEN intending to lay down land to Permanent Pasture, or for one or two years' lay, are recommended to communicate with us, stating the nature of the soil and situation, that we may advise as to sorts of Grass Seeds most suitable. OLD MEADOWS DEFICIENT OF THE MOST NUTRITIVE GRASSES AND CLOVERS may be greatly improved by sowing at this season "SUTTON'S" "Renovating Mixture" of Seeds at the rate of 8 to 12 lbs. per acre, price 1s. per lb.

OUR FINEST LAWN GRASS SEEDS are highly useful to improve Garden Lawns, or to form New Lawns.

N.B. We are extensive growers of Mangold Wurzel, Turnip, and other Agricultural Seeds, of which a separate Catalogue is published.

JOHN SUTTON & SONS, SEED GROWERS, READING, BERKS.

SEEDS—CARRIAGE FREE.

WILLIAM E. RENDLE AND CO. *have, from the very extensive patronage they have received, been induced this season to offer the following liberal arrangement to all who purchase Seeds from their establishment.*

ALL ORDERS ABOVE £5 WILL BE DELIVERED CARRIAGE FREE TO ANY RAILWAY STATION IN ENGLAND OR WALES, AND TO ANY STEAM PORT IN ENGLAND, WALES, IRELAND, OR SCOTLAND.

Two or three purchasers joining together will therefore have the advantage of having their orders delivered free of any cost for carriage.

RENDLE'S PRICE CURRENT FOR 1854 should be obtained by all who have gardens, or who take an interest in the cultivation of the soil.

MESSRS. YOUELL AND CO.

BEG TO OFFER THE FOLLOWING:—

ERICA VENTRICOSA SUPERBA, finely set with flower-buds. We particularly recommend these to the trade at 60*s.* and 75*s.* per 100.

ERICAS.—Fine bushy blooming plants, in large 48s, of the following sorts, at 12*s.* per dozen varieties, viz.:—*Aggregata, Bowei, *Coventryana, *Cavendishi, colorans, *densa, *daphnoidea, echiflora, *exsurgens coccinea, *gracilis, *hyacinthoides, intermedia, *Linnæoides nova, lævis alba, minabilis, mammosa, metuliæflora bicolor, *nigrita, *ovata, pyriformis, perspicua nana, *rubens, rubra calyx, trossula, transparens nova, Westcoti, *Wilmorea superba, Walkeri, viridiflora, *ventricosa breviflora, *v. Bothwelli, *v. coruscans, v. carnea, v. dependens coccinea, *v. fasciculata rosea, *v. f. longiflora, *v. f. superba, *v. hirsuta, *v. perspicuoides, *v. superba, *v. tenuiflora, *v. tumida.

ERICAS, in small and large 60s, nice bushy plants, many of them set for flower. All the above named marked with an asterisk, as well as the following, at 9*s.* per dozen varieties, viz.:—Denticulata moschata, elata, hyemalis, hybrida, scabriuscula, Sindryana, trossula rubra, umbellata, verticillata, ventricosa, cintra rubra, v. densa carnea.

EPACRIS HYACINTHIFLORA, by far the best of the campanulata varieties, in strong plants, 1*s.* 6*d.* each.

" hyacinthiflora candidissima (Storey's).—Is a magnificent white variety, individual flowers very large, strong plants, 1*s.* 6*d.* each; small, in stores, 9*s.* per dozen.

EPACRIS.—The following choice varieties, in 48s, well set for bloom, at 12*s.* per doz. varieties, viz.:—Ardentissima, Atleeana, campanulata alba, c. grandiflora, c. maxima, Copelandica, carnea, coruscans, densiflora incarnata, elegantissima, formosa, grandiflora, impressa, imp. alba, imp. magna, lineatus magnifica, miniata, nivalis, onosmæflora, pulchella major, purpurescens, sanguinea, Tauntoniensis, the Bride, variabilis.

Epacris, flowering plants, our own selection, to the trade, 60*s.* p. 100.

Abelia uniflora, small, 12*s.* per dozen.

Abutilon insigne, Linden's fine new species, 2*s.* 6*d.* each.

Aphelexis humilis and superbum, strong bushy plants, in large 48s, well set for flower, 12*s.* per dozen.

CAMELLIAS.—The well known difficulty of inducing the greater part of the choice varieties to bloom in a young state, tempts us to offer the following, in stout plants, without buds, at 21*s.* per dozen, viz.:—Beali, Monarch, Juliana, Bruceana, Forbesi, Grand Frederic, Ruckeri, Lombardi, Horsfalli, Lefeveriana, Picturata, Lepidata, Fimbriata rubra, Agnesi, Sieboldi, &c.

Cassia corymbosa, a good winter-flowering plant, in 48s, 9*s.* p. doz.

Ceanothus rigidus and dentatus, in large 60s, 12*s.* per dozen.

Chorozema Lawrencianum, strong flowering plants of this charming variety, in large 48s, 1*s.* 6*d.* each.

CALCEOLARIAS—Crimson King (Henderson), deep crimson, very dark and rich, and does not fade; habit dwarf and robust, flowers large, and shape good.

" Magnificent (Henderson), rich crimson, with yellow crown; a large, fine-formed, and very splendid flower, quite distinct from anything yet out.

" Gold Chain, fine golden yellow of great substance and fine habit, with very stout foot-stalks.

" Gold Cap (Garraway), rich dark maroon, the upper division of the flower deep gold colour, the flowers large and of fine compact habit.

These handsome varieties will be found the gems of the season; for bedding strong plants, 2*s.* 6*d.* each, or 24*s.* per dozen.

CINERARIAS, the choicest of the new varieties; strong flowering plants, in 48s, 12*s.* per dozen.

Corræa speciosa, major, bicolor, and Cooperi; strong flowering plants, 12*s.* per dozen.

Daphne collina, 12*s.* per dozen; Dauphine, 18*s.* per dozen.

Deutzia gracilis, small, 9*s.* per dozen.

Diosma ericoides and capitata, nice bushy plants of these sweetly-scented species, 9*s.* per dozen.

Eutaxia myrtifolia, strong bushy plants of this fine old favourite, in large 48s, 9*s.* per dozen; floribunda, in 60s, 9*s.* per dozen.

FUCHSIAS: choicest of the new kinds, including Glory (Banks), England's Glory, King Charming, Dr. Lindley, Duchess of Lancaster, Incomparable, &c., 21*s.* per dozen.

Fairy Roses, 9*s.* per dozen.

Kennedya inophylla floribunda, 1*s.* 6*d.*; Marryattæ, 1*s.* 6*d.*; monophylla, 1*s.*; alba, 2*s.* 6*d.*; and rubicunda maxima, 1*s.* 6*d.*

Mandevilla suaveolens, certainly the finest greenhouse or conservatory climber we possess, 9*s.* to 12*s.* per dozen.

Mitraria coccinea, strong flowering plants, 2 to 3 feet, 3*s.* 6*d.* each; smaller, 1*s.* 6*d.*

Olea fragrans, 24*s.* per dozen.

Passiflora racemosa cærulea, in large 48s, 12*s.* p. doz.; Bellotti, fine new peach-coloured variety, 1*s.* 6*d.* each; Buonaparti, 1*s.* 6*d.* each.

Philadelphus mexicanus, an elegant shrub with large white flowers, more fragrant than the Orange, 2*s.* 6*d.* each.

Pimelea decussata, 9*s.* per dozen; hispida, 12*s.* per dozen.

Pittosporum tobirum, this fine old favourite, 1*s.* 6*d.* each.

Sollya Drummondi, strong, 1*s.* 6*d.* each; heterophylla, 12*s.* per dozen; linearis, 12*s.* per dozen.

Swainsonia Osborniana, new, 12*s.* per dozen.

Tecoma australis, 1*s.* 6*d.* each; jasminoides, 12*s.* per dozen; rosea, 1*s.* 6*d.* each.

Tetratheca ericæfolia, small, 18*s.* per dozen.

Tree Carnations, of choicest kinds, 18*s.* per dozen.

Geranium Flower of the Day, 6*s.* and 9*s.* per dozen.

" Crimson Ivy-leaf; this fine variety, sent out by Messrs. Standish & Noble, 5*s.* each (splendid for bedding).

HARDY SHRUBS.

Berberis Darwini, 12*s.* p. doz.; very strong and bushy, 3*s.* 6*d.* each.

" Fortuni, 12*s.* per dozen; dulcis, strong, 4*s.* per dozen.

Bays (sweet), fine plants, 2 to 2½ feet, 6*s.* per doz.; 35*s.* per 100.

Cerasus illicifolia, a new hardy evergreen Cherry from California, producing purple fruit, 3*s.* 6*d.* each.

Chimonanthus fragrans, Seedlings, 4 inches, 12*s.* per dozen.

Clematis azurea grandiflora, strong, 12*s.* to 15*s.* per dozen; Sieboldi, strong, 12*s.* to 15*s.* per dozen; Montana, strong, 12*s.* per dozen; flammula, or sweet scented, in pots, 9*s.*

Escallonia macrantha; strong plants of this most charming evergreen flowering shrub, 12*s.* per dozen.

Euonymus fimbriatus, strong plants of this handsome evergreen, 2*s.* 6*d.* each; japonicus fol. variegatus, 9*s.* per dozen.

HARDY SHRUBS.

Ilex Castanifolia, strong, 3*s.* 6*d.* each; Cunninghami, 3*s.* 6*d.* each; latifolia, strong, 1*s.* 6*d.* to 3*s.* 6*d.* each; Sheppardi, fine, strong, 1*s.* 6*d.* each; tarago, strong, 5*s.* each.

Jasminum revolutum, strong, 12*s.* per dozen.

Lardizabala biternata, a fine hardy evergreen creeper, 5*s.* each.

Ligustrum ovalifolium, new species, 12*s.* per dozen.

Passiflora cærulea, strong, 9*s.* to 12*s.* per dozen.

Quercus Fordi, 2 to 3 feet, 24*s.* per dozen; Ilex Hume, 2 to 3 feet, 30*s.* per dozen; ballota, 2*s.* 6*d.* each; rotundifolia, 2*s.* 6*d.* each.

ROSES.—"Queen Victoria" (Paul's), standard and half standard, 2*s.* 6*d.* each; "Prince Albert," strong, in pots, 5*s.* each; standards and half standards, of best kinds, 15*s.* to 18*s.* per dozen; dwarfs on own roots, 6*s.* and 9*s.* per dozen.

Wistaria sinensis, strong, 12*s.* to 24*s.* per dozen.

Weigela rosea, strong bushes, 2 to 3 feet, 9*s.* per dozen.

Yucca gloriosa superba, strong, 3*s.* 6*d.* to 5*s.* each.

CHOICE HOLLYHOCKS, PANSIES, AND OTHER HERBACEOUS PLANTS, BULBS, ETC.

HOLLYHOCKS.—The following fine varieties, in strong plants, well established in pots, 12*s.* per dozen varieties:—Bicolor, Commander-in-Chief, Conspicua, Delicata, Eclipse, Fireball, Formosa Improved, Lilac Perfection, Magniflora, Magnum Bonum, Maiden's Blush, Mr. Charles Baron, Mulberry Superb, Obscura, Princess Alice, Princess Helena, Princess Royal, Queen, Rosea Alba, Rosea Rubra, Snowflake, Venosa Rubra, Walden Gem, Rosy Queen, &c.

PANSIES.—The following choice kinds, at 10*s.* per dozen varieties:—Alba Superba, Androcles, Blanche, Cæsar, Calysto, Caroline, Commander-in-Chief, Crystal Palace, Drusilla, Duchess of Rutland, Elegant, Emma, Euphemia, Glory, Helen, Heroine, Indian Chief, Isabella, Junius, Lady Carrington, Lady Franklin, Lady Harding, Lord Jeffery, Marchioness of Lothian, Masterpice, Miriam, Miss Talbot, Mrs. Beck, Penelope, Polyphema, Post Captain, Prince Arthur, Princess, Queen of England, Rubens, Sambo, Smolensko, The Rajah, Uttoxeter Hero, Viceroy, Yellow Prince.

Daisies, new Belgian, in 50 fine varieties, 4*s.* per dozen.

Dielytra spectabilis, 9*s.* per dozen.

Funkia grandiflora, 2*s.* 6*d.* each.

Rockets, double white, 3*s.* per dozen; purple, 4*s.* per dozen; crimson, 1*s.* 6*d.* each.

Oxalis rosea, one of our prettiest hardy herbaceous plants, and nearly always in flower. 6*s.* per dozen; floribunda, 6*s.* per dozen.

Pæonies, herbaceous, in 25 fine varieties, 12*s.* per dozen.

Phloxes, in numerous fine varieties, 9*s.* to 12*s.* per dozen.

Potentilla M'Nabiana, and other choice kinds, 6*s.* per dozen.

Primrose, double white, 4*s.* per dozen; double yellow, 4*s.* per dozen; double purple, 4*s.* per dozen; double lilac, 3*s.* per dozen; double crimson, 12*s.* per dozen.

Silene maritima plena, fine double white, 9*s.* per dozen.

Statice latifolia, strong, 9*s.* per dozen; pseudo armeria, 6*s.* per dozen; maritima rosea, very pretty and distinct, 6*s.* per dozen.

Choice selection of Herbaceous Plants, 25*s.* per 100.

Tigridia conchiflora, the yellow spotted tiger flower, a very desirable summer and autumn blooming bulb—it makes beautiful beds, 3*s.* per dozen.

Gladiolus insignis, one of the handsomest of the genus; the flowers, which are produced freely, are of a glowing scarlet, suffused with purple, 4*s.* per dozen; Brenchleyensis, a magnificent new variety, 3*s.* 6*d.* each.

Lilium colchicum, a magnificent new species, with lemon-coloured flowers, 7*s.* 6*d.* each; lancifolium album, flowering bulbs, 9*s.* per dozen; l. rubrum, flowering bulbs, 18*s.* per dozen.

Lily of the Valley, strong roots, 5*s.* per 100.

CARNATIONS AND PICOTEES.—Beautiful selections from their superb and extensive collections, at 18*s.*, 24*s.*, and 30*s.* per dozen pairs; fine mixed, for borders, 9*s.* per dozen pairs. True Old Clove Carnation, 12*s.* per dozen pairs.

PINKS.—Four fine sorts by name, 9*s.* to 12*s.* per dozen pairs.

CHRYSANTHEMUMS.—The most choice and showy of the large and pompone flowering varieties, strong plants, 9*s.* per dozen.

CHOICE FRUITS. (WARRANTED TRUE TO NAME.)

"FASTOLFF RASPBERRY."—It is with much satisfaction that we announce a third award made by the London Horticultural Society, on 26th of July last, for examples of the above most excellent Raspberry, unequalled by any other variety for the size of its fruit and richness of flavour.

It is reported in the *Gardeners' Chronicle* of July 30th, page 486, as follows:—"Messrs. Youell, of Great Yarmouth, sent a boxful of beautiful fruit of the Fastolff Raspberry; they were unusually fine, and well deserved the certificate of merit awarded them."

Strong well-rooted canes, 15*s.* per 100; Large White Raspberry, 24*s.* per 100; New Monthly Fruiting, 24*s.* per 100.

APPLES, standard, in best selection, good heads 9*s.* per dozen.

" dwarf " " 6*s.* "

" trained " " 30*s.* "

PEARS, standard " " 12*s.* "

" dwarf " " 8*s.* "

" trained " " 30*s.* "

PLUMS, dwarf " " 9*s.* "

" trained " " 36*s.* "

PEACHES, dwarf trained, in fine strong plants, 36*s.* to 60*s.* "

NECTARINES, dwarf trained, " 36*s.* to 60*s.* "

APRICOTS " " 36*s.* to 60*s.* "

CHERRIES, standard, in fine variety ... ... 12*s.* "

" dwarf " ... ... 9*s.* "

" trained " 36*s.* to 42*s.* "

GOOSEBERRIES, 25 of the finest varieties (good bushes) selected for size and flavour, 30*s.* per 100; 4*s.* per dozen.

CURRANTS, improved large white Dutch, Black Naples, Raby Castle (red), and Large Red Grape, 4*s.* per dozen; Knight's Sweet Red, 6*s.* per dozen; these are the most desirable kinds in cultivation, and are highly recommended.

RHUBARB, Myatt's Victoria, 9*s* per dozen; Royal Albert, 9*s.* per do.; Linnæus, 9*s.* per do.; Tobolsk, 6*s.* per do. (strong).

SEAKALE, extra strong, 2 years, 6*s.* per 100.

ASPARAGUS, extra strong, 3 years old, 3*s.* 6*d.*; 2 years old, 2*s.* 6*d.* per 100.

☞ Less quantities than those named above supplied at the same prices. Orders of 2*l.* and upwards are delivered Carriage Free to London or Hull, or to any Railway Station within 150 miles of the Nursery.

YOUELL & Co. beg to refer to their Advertisement which appeared in this Paper of last week. Catalogues will be forwarded free on application. ANEMONE SEED, saved from selected roots, 10*s.* per lb. The usual discount to the trade.

YOUELL & CO., Royal Nursery, Great Yarmouth.

JOHN JEYES, NURSERYMAN and SEED-MERCHANT, Northampton, begs to offer Agricultural Seeds of every kind, and the best quality: Horticultural and Floricultural Seeds in great variety and of the choicest selection; Ornamental Shrubs and Trees of various sizes and immense variety; a Fine Collection of Roses; Fruit Trees carefully selected from the finest proved sorts; a large Stock of Forest Trees; Russian Mats.

Plans and Estimates given for making Pleasure Grounds, Cemeteries, &c. Seeds selected and packed for Exportation.

Experienced Gardeners recommended.

HAWKES' CHAMPAGNE RHUBARB.—This most desirable variety is now for the first time offered to the public. It has stood the severest test that can be applied, and has beaten everything in Covent Garden and other London Markets in realising higher prices, from its magnificent colour and size. It has been seen by the very highest authorities and pronounced to be a most valuable introduction. In earliness it equals the Prince Albert, but of a deeper colour, and much greater bearer. It forces remarkably well, and is very hardy out of doors. Mr. HAWKES has placed the entire sale in the hands of Duncan Hairs.

One-year-old plants, strong, 5*s.* each. A few two years old, very strong, for sale.

LAING'S MAMMOTH RED CELERY.—This is considered the largest yet grown, attaining the extraordinary weight of from 10 to 12 lbs., and at the same time perfectly solid. It is nearly perennial in its habit, as it will not, under any circumstances, run to seed the first season, and it is difficult sometimes the second when planted out for that purpose. In colour it is a bright red. In flavour unsurpassed, if equalled.

It has been seen growing by many practical gardeners, who deem it a new feature in the garden, from the fact that it may be had nearly all the year. Packets 2*s.* 6*d.* each.

MITCHELL'S HARDY EARLY CAULIFLOWER.—This is grown precisely as the handglass variety, but when removed from the frame does not require the same protection, and comes in immediately after. This is particularly recommended for gentlemen's establishments. The head is not large, but handsome and compact, and is so firm that you may let them stand from 10 days to a fortnight and they will not get frothy or loose. This is quite a distinct variety. Packets 2*s.* 6*d.* each.

DUNCAN HAIRS, Seedsman, 109, St. Martin's Lane. Post Office orders to be made payable at Charing Cross.

CASTLEWOOD GREEN TOP SEED POTATOES.—After much search, the pure and original "Green Top" was found in a remote district of the west of Ireland, by the undersigned. A breadth sufficient to supply the seed largely was planted, and from this source the public may rely on obtaining pure, honest, uncontaminated Seed. The characteristics of this family of tubers are:—

1. Economy as Seed—They will plant twice the quantity of land, weight for weight, that any known variety will, because they can be planted at twice the distance from each other.

2. Productiveness—One small cut seed having produced in one plant, 49 tubers; in many, 34 and 36, in all an average of 15.

3. Flavour and nutritiveness, which are superlative.

4. Resistance of blight, of which power they have proved themselves possessed in the extreme, as in a field of 5½ Irish acres scarcely 5 per cent. exhibited disease.

To each purchaser of seed, however small, plain directions for planting will be given. The public are cautioned against a spurious root, which some individuals are endeavouring to pass off as the genuine "Castlewood" Potato.

FREDERICK BEVERLEY DIXON, Castlewood House, Durrow, Queen's County.

Samples of the Seed may be seen, and orders given, at Mr. FENESSY'S, Seedsman, Kilkenny; and THOMAS EELES & Co., Seedsmen, &c., 22, Mary Street, Dublin.

Price, delivered free on board at Dublin, 25*s.* per barrel of 20 stone; bags included. Post Office Order to accompany order from unknown correspondents.

KNAP HILL NURSERY, WOKING, SURREY.

WATERER AND GODFREY, Nephews and Successors to the late HOSEA WATERER, respectfully invite the attention of parties engaged in planting to the following list:—

Araucaria imbricata, 2, 3, 4, 5, and 6 feet high, in the open quarters, regularly removed every year, and as robust and handsome as it is possible to get them. We have a large stock.

Cryptomeria japonica, 2, 3, 4, 5, 6, to 8 feet.

Cedrus Deodara, stout handsome plants from seed, in any quantity, and of all heights from 1 to 7 feet. A few splendid specimens 10 to 15 feet; warranted to transplant with perfect safety.

Cedar of Lebanon, 2, 3, 4, 5, 6, 7 to 10 feet. These large Cedars of Lebanon are also very handsome trees.

Cupressus macrocarpa, or Lambertiana, 2, 3, 4, 5, 6, and 8 feet, all from seed.

" Goveniana, 2 to 3 and 4 feet.

" Funebris, 2 and 3 feet.

" thyoides variegata, 2, 3, and 4 feet.

The Variegated White Cedar, a scarce but most beautiful variegated plant, seldom seen except at Elvaston Castle. We hold a large quantity.

Juniperus Bedfordiana, fine plants, 3, 4, and 5 feet.

" Chinese, 2, 3, 4, 5, 6, 8, and 10 feet.

" repandus, 3, 4, 5, to 8 feet.

" Upright Irish, 3, 4, 5, 6, 7, and 8 feet; perfect columns, and, except at Elvaston, unequalled.

" Virginiana, the Red Cedar, 4, 5, 6, and 8 feet.

Taxodium sempervirens, 2, 3, 4, 5, and 7 feet.

Yew, common, 3, 4, 5, to 8 feet high.

" Irish, 3, 4, 5, to 10 feet. A splendid lot, all being trimmed to one stem; it adds much to their appearance and value.

" Gold striped, 1, 2, and 3 feet.

" do. worked on the Common, with fine heads, 4, 5, 6, and 7 feet high; very handsome.

" elegantissima (new striped) standards. The golden Yews are very ornamental, and we have a large quantity of fine plants.

" Dovaston, or Weeping Yew, fine standards.

Pinus Douglasi, 3, 4, 5 and 7 feet; a few magnificent plants, 10 to 12 feet high.

" insignis, 2, 3, 4, 5, 6, and 7 feet; all from seed.

" cembra, 3, 4, to 6 feet.

" Canadensis (Hemlock Spruce), 3, 4, and 6 feet.

" morinda, 3, 4, and 6 feet.

" Menziesii, 3, 4, 6, and 8 feet.

" cephalonica, 3 to 4 feet.

" Pinsapo, large and handsome, 3 and 4 feet.

" Nordmaniana, from seed, 1½ foot; a few larger, 2 feet.

" nobilis, stout plants, with perfect heads, about 1½ foot; a few larger specimens, 3 and 4 feet. We hold a fine stock of this beautiful Fir, none of which are grafted.

Thuja Arbor-vitæ, American, 3 to 6 feet. We recommend this plant for hedges.

" Weareana, 3 to 6 feet, one of the few really hardy and most useful evergreens.

" aurea. This is perhaps one of the prettiest plants of the day; it was first sent out from this Nursery, and our stock, for size and beauty, is unsurpassed.

Libocedrus chilensis, 1½, 2, and 3 feet. This is a very distinct and beautiful plant, of recent introduction. Our stock is large and good.

Independent of the foregoing we are very large holders of the most useful Evergreens, Deciduous and Ornamental Trees, and of large size. Priced Catalogues will be forwarded on application, enclosing two postage stamps, which will also include a Descriptive Priced Catalogue of the celebrated collection of American Plants grown at this Nursery.

The Nursery is near the Woking Station, and about an hour's ride from London. A visit is earnestly solicited from all who intend planting during the forthcoming season.

SEEDS—SELECT AND NEW SORTS.

BASS AND BROWN'S SPRING CATALOGUE OF SEEDS AND PLANTS is now complete, and supplied free for three penny stamps.

The following are a few new and select sorts quoted from the Catalogue.

Those offered by the packet may be had free by post.

*Those marked * have not been offered in the Catalogue.*

	s.	d.
BROCCOLI—Elletson's Emperor, large fine late sorts, per packet	2	6
„ Dilcock's Bride, very large and fine, per packet	2	6
CABBAGE—Mitchell's Early Dwarf York, Barnes' New Early, Spotsboro', and other choicest, each, per oz.	0	8

WILLIAM E. RENDLE & Co., Seed Merchants, ESTABLISHED 1786. Plymouth.

The quantities contained in the above Collections will be found in our PRICE CURRENT AND GARDEN DIRECTORY, *just published.*

JOHN CATTELL begs to say that the following priced Catalogues of his Nursery Stock and Seeds may be had on prepaid application, by enclosing a penny stamp for each.

Roses, Fruit Trees, Forest Trees, including Quick, Privet, Briar, Holly, &c., suitable for hedges; Hardy Ornamental Trees and Shrubs, including Coniferæ, American Plants, Climbers, &c. Kitchen Garden Seeds. Flower Seeds, in which are enumerated very superior selections of German Stocks, Asters, &c., genuine as imported, in large or small packets, to suit all purchasers.

The following selections are exceedingly fine:—Cedar of Lebanon, from 2 to 8 feet, splendid upright plants, in first-rate order for removal. Cedrus deodara, fine, from 1 to 8 feet. Azaleas, Ghent and English, of the most showy varieties, loaded with bloom buds. Rhododendrons, of all the leading sorts. Kalmia latifolia, in variety, very fine. Andromeda floribunda, splendid plants. Roses, the standards are particularly straight strong stems, also some extra tall stems from 5 to 6 feet, worked with climbing and other showy sorts; the dwarfs are also fine strong plants. Fruit Trees, consisting of the leading varieties, fine and in good order.—Westerham, Feb. 11, 1854.

COLE'S SUPERB CRYSTAL WHITE CELERY.

J. THORNLEY, W. COLE, AND Co., NURSERYMEN, SEEDSMEN, and FLORISTS, Withington, Manchester, beg to announce that they are now prepared to supply this fine Celery at 1*s*. 6*d*. per half-ounce packet, or in larger quantities. This variety has given universal satisfaction, and has been proved to possess all the good qualities attributed to it by W. Cole last season. It can also be procured from the following agents:—

Messrs. Hurst and M'Mullen, 6, Leadenhall Street; Messrs. Noble, Cooper, and Bolton, 152, Fleet Street; Messrs. Minier & Co., 60, Strand; Messrs. Charlwood & Cumming, Covent Garden; Mr. Turner, Slough; Mr. Duncan Hairs, St. Martin's Lane; Mr. Denyer, Gracechurch Street; Mr. J. Fairbairn, Clapham; Messrs. A. Henderson & Co., Pine Apple Place; Messrs. Downie and Laird, Edinburgh; Messrs. F. & A. Dickson, Chester; Messrs. F. & A. Dickson, Manchester; Messrs. J. & J. Fraser, Lea Bridge, Essex; Messrs. Little and Ballantyne, Carlisle; Messrs. Veitch & Son, Exeter; Mr. J. Veitch, Exotic Nursery, Chelsea; Mr. Clarke, King Street, Covent Garden; Messrs. Finney & Co., Gateshead; Mr. A. Pontey, Plymouth; Mr. E. Rendle, Plymouth; Mr. Cattell, Westerham, Kent; Mr. Smith, Riverhead, Kent; Mr. Epps, Ashford and Maidstone, Kent; Messrs. Lucombe, Pince, & Co., Exeter; Mr. Browne, Norwich; J. Cole, Keyfield Nursery, St. Albans; Garaway & Mayes, Bristol; Drummond & Son, Stirling.

All orders to be addressed as above, instead of to "Dartford" as heretofore.

PYRAMIDAL PEAR TREES ON THE QUINCE STOCK.

J. AND J. FRASER, NURSERYMEN, Lea Bridge Road, Essex, beg to offer the above in fine strong trees, and such as would fruit the first and second year after planting, at the undernamed prices. These Pears are remarkable for their compact style of growth and prolific bearing; the collection comprises the following fine sorts:—Beurré d'Amanlis, Beurré d'Aremberg, Beurré de Capiaumont, Beurré Diel, Beurré Easter, Beurré Grise d'Hiver, Nouveau, Beurré Rance, Williams's Bon Chretien, Crassane, White Doyenné, Duchesse d'Angoulême, Forelle or Trout Pear, Glout Morceau, Hacon's Incomparable, Jargonelle, Louise Bonne of Jersey, Marie Louise, Napoleon, Winter Nelis, and Passe Colmar.—Price 2*s*. 6*d*. to 3*s*. 6*d*. each.

POLYANTHUS SEED.

TO THE LOVERS OF THAT BEAUTIFUL EARLY SPRING PLANT, THE POLYANTHUS.

JAMES WOODS has again to offer a quantity of POLYANTHUS SEED, which he has this year saved with more than ordinary care, from about 80 named and good laced flowers, which he can recommend with confidence; with directions for sowing. Price 1*s*. per packet, or sent free on receipt of 13 postage stamps. J. W. has a quantity of RANUNCULUSES, good old superfine named sorts, in one general mixture, which he will send free by post at 4*s*. per 100, or 35*s*. per 1000, on receipt of Post Office Order or postage stamps, to JAMES WOODS, Florist, Harwich, Essex.

P.S.—Plants of Polyanthus will be sent out in April at exceedingly low prices, with blooms on each plant, as the stock must be reduced, the land being wanted for railroad purposes.

DOUBLE ITALIAN TUBEROSE ROOTS, 4*s*. per dozen.—The annual importation of the above-named beautiful and fragrant Flower has just been received, and large and well selected Bulbs may be obtained, without disappointment, at A. COBBETT'S Foreign Warehouse, 18, Pall Mall.

N.B. Printed regulations for treatment sent; also, just arrived very moist and open Parmasan Cheeses.

WILLIAM NICHOLSON still continues to send out very strong well-rooted Plants of his four new and distinct varieties of STRAWBERRIES, viz., AJAX, dessert Fruit; RUBY, ditto; CAPTAIN COOK, Market Fruit; FILLBASKET, ditto, at 15*s*. per 100, or 25 each of any two sorts for 10*s*., box included. Post-office orders payable at Yarm, Yorkshire. For a full description, see Advertisement *Gardeners Chronicle* Jan. 28, 1854.—Egglescliffe, near Yarm, Yorkshire.

TO POTATO GROWERS.

W. DRUMMOND AND SONS, SEEDSMEN and NURSERYMEN, Stirling, N. B., offer for sale several tons of ROS'S EARLY AMERICAN POTATOES, grown expressly for seed, on reclaimed peat or moor, and without manure. Not a trace of disease could be seen in the crop. This Potato has been well known in Scotland for the last 40 years, as one of the very best for general garden or field crops. It is very productive, full sized, dry, and finely flavoured; and is earlier than the Regent.

Price 22*s*. per sack of 2 cwt., sack included, and delivered carriage free in London, Liverpool, and Hull.

Unknown correspondents will please send a remittance with their orders.

May be had on application, a very useful priced Descriptive CATALOGUE of VEGETABLE SEEDS, containing only such varieties as are really worth cultivating.

This Advertisement will not be repeated.

PEAS! PEAS! THE BEST VARIETY IN CULTIVATION.

CHAMPION OF ENGLAND, a blue wrinkled Pea, very productive, of quick growth, and of a most delicious flavour. This extraordinary Pea combines in one the merits of all others, and has none of their demerits; for, although a wrinkled Pea, it is both hardy and early, and being of quick growth, it is the best kind to plant throughout the season for each crop. It is highly productive, bearing very long pods of a lively green, which are well filled, and the Peas are generally as large as small horse Beans, of a deep green colour, and beyond all others of a most delicious flavour. Height, 3 ft. to 3½ ft.

Price, in quantities of not less than 1 peck ... Bag included 6*s*.
„ „ „ 1 bushel ... „ 16*s*.
„ „ „ 1 sack (4 bushels) „ 60*s*.
„ „ „ 8 bushels (1 qr.) „ 106*s*.

Delivered, freight paid by Railway to London.

Orders, with remittance or satisfactory reference, will have immediate attention on application to

H. AND A. WALLIS, SEEDSMEN, Ipswich.

NEW FUCHSIAS AND DAHLIA PLANTS, AND CUCUMBER SEEDS.

J. BATTEN, FLORIST, will send out, after Feb. 20, strong plants of the following FUCHSIAS:—

GRANDISSIMA—Deep claret corolla, long white tube, good habit.

MR. CHARLES PALMER—Scarlet corolla, white tube, broad inverted sepals, fine habit; first-class certificate at Hackney.

ADMIRAL—Light crimson corolla, light tube, free bloomer.

At 7*s*. 6*d*. per plant, or the set for 20*s*.

BUSHELL'S LONDON DON DAHLIA—Colour scarlet orange, rivalling the Duke of Wellington, at 5*s*. per plant, in May next.

BATTEN'S CUCUMBER SURPRISER—Black spine, fine flavour, and first-rate for exhibition. Sealed packets of six seeds for 2*s*. 6*d*.—Brook Street, Clapton, Feb. 11.

WHEELER AND SON'S PRICED LIST OF FARM SEEDS FOR FEBRUARY. *See last page of this Paper.*

WHEN the NEW FOREST was last before our readers (*Gard. Chron., July* 30, 1853) we limited our remarks to its past management, the Parliamentary papers at that time accessible containing no data by which the skill of the present surveyor could be tested. The new blue book supplies the deficiency, and, from the facts stated therein, it would seem that the fitness for his office of the new public officer is of the same kind as that of the gentlemen who have the honour to mismanage the Royal forests in other parts of the kingdom. The Treasury, true to

the principles avowed by a late Commissioner, has regarded a knowledge of the business that he has to conduct the last of all qualifications to be looked to, and nominated as a successor to Col. Thornhill a Mr. L. H. Cumberbatch, concerning whose history we have the following official record.

Mr. Kennedy describes him as a clever and active young man, having many good habits of business, but as being much too young to have been placed in so difficult and responsible a situation. "*He was bred in Mr.* Clutton's *office.*" Mr. Cumberbatch's own account of himself is that "he was 25 years old on the 1st of March, 1853; that he was then an efficient officer, and had been employed as deputy surveyor for three years and a half." He therefore was *twenty-one years and six months old* when he was appointed to this great charge. We can now understand why it was that the Treasury officers put in action last session every known parliamentary dodge in order to avoid making a return moved for by Mr. Aglionby, of whose independent character and well known honesty of purpose they evidently stood in dread. Even official hardihood was unable to face the consequences of an admission that "so great a concern as that of the New Forest," notorious for the deplorable state into which it had fallen, and demanding the utmost skill and practical experience for its restoration, had been entrusted to a lad taken out of Mr. Clutton's office.

Well might Mr. Kennedy urge upon the Treasury the paramount importance of making the best selection possible of a new surveyor for Dean Forest upon the occasion of the then officer having resigned, more especially since "in the department in London through which he has to administer the affairs of all the forests he has not the advantage of the assistance of any one individual who has the slightest knowledge of rural affairs"! This appeal to the Treasury was made on the 12th February, 1853, but so little did their lordships concur in such views that we cannot find that a successor has even yet been named to take the great Forest of Dean out of the feeble hands of Mr. Machen. People will be apt to suppose that the Treasury would not appoint the best man who could be found, and dared not, with the eyes of the public and of Parliament upon them, perpetrate another job. At all events, for an entire year, Dean forest seems to have been left as it was; one of the results of which has been that its net income has been above 6000*l.* less than it should have been. Here we have another glimpse at the mysterious "difficulties and obstructions" of which Mr. Kennedy complains to Parliament. But to return to the deputy surveyor and the New Forest, and the consequences attendant upon his appointment.

It is to the New Forest more especially that the world supposes that we look for navy timber, whose growth is the only purpose for which the Royal forests are maintained. How great a misapprehension this is we have long since pointed out. The supply has, however, been at last renewed, under the inflexible discipline of the Commissioner, and the surveyor was called upon to furnish his quota. His mode of complying with the order is stated to be as follows:—

It appears that the Admiralty had desired to have from the New Forest 2000 loads of Navy timber from the fall of the year 1852, "of such quality as could be accepted, and was fit to be received into the Royal dockyards," and orders were accordingly given to the deputy surveyor to provide the quantity.

On the 18th of October that young gentleman informed the Commissioner that the arrangements were nearly completed, without intimating that any disappointment was likely to arise. But a week later it came out that the navy timber would fall short, by more than one-half, of the quantity which the surveyor had undertaken to provide. Upon being called upon to explain his conduct, he sends in a doleful letter, attributing the disappointment to "excessive rejections" by the Admiralty purveyor, and to new arrangements made by the Commissioner; the chief object of which appears to have been the prevention of the old trick of foisting upon the dockyards from Royal forests, rubbish unsuitable for naval purposes, in order to swell the forest account of produce sold.

In the words of the Commissioner, "Mr. Cumberbatch seemed to think that the timber had been too severely tested, and that if it had not been so severely tested, it might, as on former occasions, have gone into the dockyard without its defects having been previously ascertained. This I thought a most objectionable principle, inasmuch as it seemed to rest on the view that the forest and the dockyards are opposing parties, and the interest of the forest might with propriety be advanced to the detriment of the interests of the dockyard." Of course this led to inquiry, the particulars of which will be found in the Parliamentary papers. We have only space to give the result of the investigation. It was found that there had been no "excessive rejection" whatsoever, although about 58 per cent. out of 3115 trees were refused; and that, moreover, reducing trees into loads, while rejections in the New Forest amounted to 53·2 per cent. upon the quantity estimated to be available for the navy, the estimated proportion in

Dean Forest was	... ...	15·4 rejected.
Whittlewood ...	... ...	28·5 "
Wychwood ...	... ...	13·1 "

Such is the knowledge shown by Mr. Clutton's juvenile nominee in the very important duty of selecting navy timber.

If we turn to the planting operations carried on by the New Forest Surveyor, we continue to find the same incapacity. Upon this subject we have the deputy surveyor's own statement to enlighten us. He reports that, in 1852, the greatest proportion of the trees planted by him on 50 acres of Broadley Heath *died;* that of the trees he planted on 100 acres of Frame Heath the greater portion *failed;* that in another place, where he had planted 60 acres with Scotch Fir, one-third *died,* and the remainder were damaged; and that the *same statement* applies to a belt of Scotch Firs. So that the planting of 210 acres was a failure. The excuse—of course so "clever and active a young man" can have no difficulty in finding excuses for unsuccessful planting, as well as for unskilful timber-falling—the excuse is that the weather was *so* dry. No wonder that, after this exhibition, the Commissioner should have put an end to the doings of so inexperienced an officer by a peremptory order that no further planting should be attempted. We should like to know how much money this sort of apprenticeship costs the country.

That we here meet with another of the Commissioner's difficulties is sufficiently plain. But, as if matters had not been bad enough already, the Treasury resolve to add to the confusion by an obstruction of their own. It appears that Mr. Kennedy, having no one, as he says, in his department, in the slightest degree acquainted with rural affairs, had presumed to look abroad for the best advice he could find. In doing so he applied to Mr. James Brown, the well-known successful forester at Arniston, and all who know anything of these matters are aware that he is the best man whose services are obtainable. Mr. Brown reports upon the New Forest, ably, fairly, and fully, although not in the Cluttonian fashion. This report is sent to the Treasury, and with what result?—why, my lords direct Mr. Brown's report to be sent to Mr. Clutton for his "opinion"!! This sagacious determination is announced by Mr. James Wilson, one of the Secretaries of the Treasury, on the 29th of March, 1853. So that the way of managing such matters in the Treasury Chambers is this—a Royal forest becomes a public scandal—Mr. A is called upon to report upon it, and suggest how it is to be dealt with—Mr. A recommends his clerk B to be put in charge;—to be sure B knows nothing about forests, but he is well backed, and ready for anything; therefore, at the mature age of 21 years and six months, one of the greatest territorial possessions of the Crown is handed over to him. Of course B breaks down; the Admiralty won't take his timber, and his trees won't grow. Then the officer C, who is really responsible for such results, unless he stops them, direct a very experienced agent D, to examine what has been doing and to advise accordingly. D sees in a moment where the mischief lies, and skilfully indicates the remedy. Delighted at having at last obtained possession of such a document, C, imagining in his simplicity, that "my lords" would see how important it is to the public interest that it should be acted upon, sends it to Treasury Chambers for approval. Instead, however, of supporting the Parliamentary officer in the discharge of his duty, my lords determine to trip up his heels, and direct their secretary to write him a snubbing letter, commanding him to refer the report to A, who nominated B, the young gentleman whose incapacity led to the whole inquiry.

Had we been told that such a line of conduct had been taken in any public department, we should have disbelieved it; and we only credit it now because the circumstances are officially recorded in a report to Parliament. It has however become impossible that inquiry should be evaded, and we have a confident belief that the Committee just moved for by Mr. Drummond will put an end to proceedings which we can only describe as a national disgrace.

We breathe an atmosphere of marvels. A few years since the world was astonished by the announcement that so harmless a substance as cotton wool could be made to serve the purposes of gunpowder; and gun cotton was patented for the purpose. Shortly afterwards an ingenious apothecary discovered that gun cotton could be employed to heal the wound it caused, a substance called Collodion, the prince of plaisters, having been made by dissolving this sort of cotton in ether. And now it appears as if Collodion itself were likely to become a new arm in gardening.

Collodion is not merely adhesive, but impenetrable by water, and impervious to air. Taking advantage of these properties it occurred to Mr. Lowe that in the nice act of propagating plants, this substance might be advantageously employed. It would be unjust to this gentleman if we did not give his statement, as officially made public in the Proceedings of the Royal Society, before whom a paper on the subject has been lately read.

It had occurred to him, that if a cutting of a plant were sealed at the base, so as to exclude the moisture of the soil from ascending the stem in injurious quantities, the method of striking cuttings of most species of plants would not be so precarious a process as at present; and accordingly some collodion was obtained in order to make the experiment.

With respect to this new process, he states, that immediately upon the cutting being severed from the parent stem, the collodion was applied to the wound, and then left a few seconds to dry, after which the cuttings were potted in the ordinary manner.

To test the value of this new process more effectually, duplicates of all the species experimented upon were at the same time similarly planted, without the collodion being applied to them.

Experiments were carried on in two different ways; one batch of cuttings being placed on a hot-bed, whilst a second batch was planted in the open ground, without even the protection of glass.

First Batch.—All of which were placed on a hot-bed on the 1st of September, and examined on the 1st of October:—

Stove Plants.

Number of Cuttings with Collodion applied.	Name of Plant.	Number of Cuttings which took root	Number of Cuttings without the Application of Collodion.	Number of Cuttings which took root

First batch ...	59	46	59	23
Second batch ...	72	40	72	19

The experiment, the author considers, speaks for itself. Notwithstanding the season being too far advanced for the full benefit of the process to be thoroughly observed, still twice as many cuttings took root treated by the new method as had roots by the old. The mortality in the open ground was increased by slugs having eaten off above the soil some of the cuttings; those thus damaged were examined after they had been in the ground a month, and it was found that the collodion was quite as sound as when first applied. It would therefore appear that the collodion seals the wound of the cutting, and protects it from the fatal effects of damp until roots are prepared to force through the cover

ing of gun-cotton. It is further stated that the application of this solution has been found to be exceedingly beneficial in the pruning of such plants as Euphorbia speciosa, Impatiens latifolia, Impatiens latifolia-alba, Hoya bella, Hoya imperialis, &c., the cut branches being prevented from bleeding.

It is the author's intention next spring to follow out this experiment, in budding and grafting, as he considers that it will also be useful in this branch of horticulture.

Gutta-percha, dissolved in ether, was in some instances substituted to heal the wounds caused by pruning; yet owing to this solution not drying as rapidly as collodion, the first, and sometimes the second application was not sufficient.

The effect of these solutions upon cut flowers was very marked. Two branches were gathered as nearly alike as possible; to the flower-stalks of the one, collodion was applied. These flowers were placed in vases filled with water; those coated over with collodion began to fade in 36 hours, and many were quite dead in three days; whilst the flowers merely placed in water in the ordinary manner remained fresh and healthy. Those that faded soonest were Reseda odorata and Tropæolum majus, and those which were least affected were Tagetes erecta and Senecio erubescens.

Want of space prevents further notice of this curious statement to-day, but we propose to take an early opportunity of returning to it.

The Fellows of the Horticultural Society, who are growers of tender AQUATIC PLANTS, will be glad to know that the Society has received a small parcel of seeds of two or three species of Nelumbium, and that they are now in course of distribution to applicants.

VEGETABLE PATHOLOGY.

No. VI.

9. Though it is not to be denied that there are vegetables, however comparatively few in number, in which multiplication takes place solely by the organisation of the protoplasm without any distinct division of pre-existent membrane, the more general mode of growth is by successive division of cells, or by their ramification, which is in fact merely a modification of the more usual manner of division.

10. In many cases, however, the two modes of growth are combined, especially in the fructifying state of plants, as in all ascigerous fungi, and in the embryo sacs of the higher vegetables; or if Schleiden's views as to the functions of the pollen tubes are admitted, in the organisation of their protoplasm. It is probable also that this is the case sometimes where the cavities of vessels become filled with cellular tissue, and there seems reason to believe that the intercellular spaces are sometimes so filled up, without pullulation from the walls, by organisation of the intercellular substance.* According to Mirbel's views as to the origin of the infant layers of the wood and bark, the organisation of the cambium is a case in point; but without admitting the origination of the young wood from fibres descending from the buds, the matter admits of a much easier explanation by the division of cells, as confirmed by the recent observations of Trécul, and originally propounded by Hartig.

11. In many instances the mass of cells which constitute a plant is protected from the immediate contact of the atmosphere and the matters which it contains by a membrane of greater or less delicacy and strength, but mostly highly extensible, which forms the true cuticle. This membrane exists in some of the lower vegetables, and is due to matter exuded from the walls of the cells. Under vital influence membranous expansions are very readily formed by means of chemical agents, but even where no such action can be supposed, the formation of membrane sometimes takes place as observed by Reissek† in Potatoes submitted to the action of heated water, in which the original cell walls break up entirely, leaving the mass of swollen starch granules covered with a network of coagulated albumen, round one or more of which masses a new distinct cell wall is formed on the further application of heat. The new membrane has precisely the same chemical composition as that which it has replaced.

12. The highest and most complicated vegetables are, therefore, masses of cells variously combined and modified, but all originating in the first instance from a single cell, which by division or organisation of matter derived from it has given rise to various orders of cells, differing often in their essential functions, and to the delicate investing cuticle. According to the observations of Ehrenberg many individual spores concur in the formation of certain fungi. This, however, requires confirmation in those cases, as in *Erysiphe*, where the circumstance would be of much weight. The larger Hymenomycetes may be regarded as compound plants, made up of a multitude of individuals, the tips of whose ramifications bear fruit.* *M. J. B.*

* The fronds of many Ferns under cultivation, as *Asplenium Nidus Avis*, are easily damaged when very young and tender by a very short exposure to the direct rays of the sun. In this condition there appear to be cavities of the frond, which are at a later period filled up with cellular matter, and the fronds are then less susceptible of harm. Mr. J. Henderson, A.L.S., has often pointed out this circumstance to the author, and has suggested the probable mode of organisation.

† Ueber Künstliche Zellbildung in gekochten Kartoffeln von Siegfried Reissek 1851.

THE ORCHARD HOUSE.

This is not necessarily "a house for the cultivation of miniature fruit trees in pots," as "W. C. E." supposes, for, though Mr. Rivers cultivates small trees in pots for the purposes of sale, he is too much a man of the world to wish to confine plants to that system of cultivation, and I have no doubt that he would give "W. C. E." full license to grow the trees as large as he pleases so long as he keeps them in a fruitful state. It must not, however, be forgotten that pot cultivation offers many facilities which could not be obtained with trees permanently planted out, viz., those of retarding or forcing those fruits the season of which it may be desirable to prolong; thus, though we may commence Peach eating in May, I presume there are few persons who would object to the season of the finer kinds being extended to October or November, and the same with regard to Apricots, and this may be attained by growing the plants in pots, and keeping them in a north aspect until they are required for succession, then they may be introduced into the orchard house, and some weeks are added to the season of a delicious fruit.

Glass walls are exceedingly attractive and neat looking, but instead of a narrow glass case, as they necessarily are, we must have a commodious house accessible, and a grateful retreat and promenade at all times, but more especially in weather such as we have lately experienced. A 10 foot 14-inch wall, with good footings and coping, at the present price of materials and labour, could not be built for less than 15*l.* per rod, if for that sum, while I can point to an orchard house 300 feet in length and 17 feet in width, and I think I may say one of the finest ranges of glass in England, which was completed with iron trellises for training the plants, metal roof, and sheet glass, for less than 17*s.* per foot running. Here is no makeshift, every part of the work is executed as well as if one of our great London contractors had had a *carte blanche* to execute the work in the best possible manner. Thus, supposing a square acre of kitchen garden had to be inclosed, I will, for the sake of even numbers, say each of the four sides is 70 yards, giving 60 square yards beyond the acre; the expense of such inclosure at the preceding rate per foot would be considerably under 700*l.*, while it would give nearly 700 feet of glazed promenade, and supposing the trees to be trained, a surface of trellis-work equal to 14,000 feet would be presented, or allowing Mr. Knight's calculation of 1 lb. of fruit to every foot of glass, an acre of ground thus bounded would produce annually, after the trees were established, 8 tons 12½ cwt. of first-rate fruit, which at 6*d.* per lb., a low price for glass produced fruit, would give an annual product of 483*l.*, not bad interest for the expenditure of 700*l.*, or with the trees complete say 1000*l.*

To recur to the house before alluded to: it is erected in the garden of Josh. Martineau, Esq., near Alton, Hants, by the intelligent gardener and bailiff, Mr. Duncan; and though the house had been up only two years when I saw it in September last, the training surface was completely covered with fruit bearing wood, and such a crop of Plums, &c., as did a gardener's heart good to see and taste. Talk of quality! If "W. C. E." and gardeners of the old wall school could only have tasted the Green-gages, Coe's Golden Drop, Downton Imperatrice, Jefferson's, and other Plums, each kind hanging in the greatest profusion, and each fruit "a perfect sweetmeat," they would wish to say "good-bye" for ever to brick walls for fruit trees. A few Apricots also lurked among the leaves, and they fully bore out Col. Mason's estimate of them at p. 38. Peaches and Nectarines were alike delicious; Figs unmistakeably good, and winter Pears were of the finest quality. I think I may safely say that there were bushels of Plums, which at that time in Covent Garden would have brought from 2*s.* to 3*s.* 6*d.* per small punnet, and these, I have no doubt, would be in use until the end of November. The Jefferson Plum here was found, as was expected, superior to the Green-gage, both being ripened side by side; so those who have not planted it should lose no time in procuring it.

But this house yielded something beside fruit, and an abundance of gratification. In the spring, a row of Bishop's New Dwarf Long-podded Peas, 300 feet long, produced an abundant supply some time before the ordinary early kinds came into use; and at the time of my visit, French Beans in pots were just being housed to succeed those already frost-bitten in the open garden; and thousands of pots of Strawberries had been prepared for a similar purpose in the coming spring. I know not whether the house is used for the protection of winter Salads, or for the production of early Rhubarb, Sea-kale, &c., in spring, but I saw sufficient to convince me that these houses have an applicability scarcely yet dreamt of by their warmest advocates; and visions of early Cauliflowers in pots in hundreds in spring, Walcheren and Snow's Superb Winter in autumn and winter, and salads in bushels throughout the year, flit before my eyes. What a glorious place, too, for the protection of Strawberries and hardy flowering plants for forcing in the winter, and for Violets and Anemones, and many more things for early cutting! But enough of the practicability.

Considered artistically, I cannot raise an objection to them; but I can see how infinitely more elegant, tasteful, and appropriate an acre or two of garden so inclosed would look, compared with the old, heavy, ugly prison walls. So arranged, a kitchen or fruit garden need not be stowed into any out-of-the-way corner, to be out of sight, or be planted round with tall trees for the same purpose which, after a few years become a nuisance, shading with their branches, and robbing the ground with their roots. A garden inclosed by a glazed promenade would be sightly and elegant anywhere, and the flower garden and pleasure ground might surround it with great propriety, and would be a combination such as the most fastidious sticklers in taste could not object to. For the sake of intricacy and variety the system of planting the promenade might be much varied. In one part the walk might pass between the trees, in the second it might be embowered by trellis work and trained trees, in the third the centre could be planted with walks round the sides, and in a fourth a serpentine walk might be attempted; and by continuing such an arrangement round the garden great variety could be obtained. Indeed there is no particular objection to a part being devoted to Camellias, Azaleas, &c., and that would be a conservatory wall in earnest.

Lastly it must not be forgotten that though the expense of erecting a glazed promenade may be something more than a wall, there will be no after expense for hothouses, conservatories, &c., for the whole may be included in the promenade; and as the kitchen and fruit garden need not be larger than is sufficient for the production of the choicest fruits and vegetables, there is no reason why it may not at all times be as neat and trim as the best kept flower garden.

Such an arrangement opens quite a new field in a pecuniary as well as in an artistic and utilitarian point of view, and I shall be glad if the preceding remarks should, in the remotest way, be instrumental in inducing those who are forming new gardens to pause before they commit themselves to bricks and mortar, merely because others had done so before them. Garden walls must now be regarded as the "light of other days," and must give place to structures which will enable us to import the fine climate as well as the fine fruits of more favoured countries. *W. P. Ayres, Blackheath, Jan. 23.*

* The full consideration of this subject would lead us into details which would be quite out of place here.

STREPTOCARPUS REXI.

This interesting little Cape plant is well worthy of cultivation where small plants are wanted, and it is by no means difficult to manage; for if properly ripened and dried off it may be wintered in a greenhouse with perfect safety, but like many other Cape plants it delights in a warm moist temperature while it is growing. The compost in which I have found it to succeed best has been composed of good, rich, well-decayed turfy loam and leaf soil, with a liberal quantity of sharp silver-sand intermixed; and a small quantity of thoroughly-decayed cow-dung is of great service in promoting the vigour of the plants, but this must not be used unless it is thoroughly decayed. Propagation is readily effected either by means of seeds, which are produced freely, or by division; but the latter method is preferable where only a small increase is wanted. The plant should be divided as soon as it has done flowering, and a few plants should be encouraged into growth early in spring so as to be able to break them up and get the young plants well established before winter. Plant each bit in a 4-inch pot, using the same soil as recommended above, with a little more sand in it; and be careful to secure perfect drainage by filling the pots about one-third with crocks, for the plant is impatient of damp. Plunge the pots in a gentle bottom heat where a humid atmosphere of about 75° or 80° can be maintained, and attend to watering and shading in bright sunshine until the plants become established, which will soon be the case. Give a shift into 6-inch pots as soon as it is found that the plants are well established in their first pots; but if this should not be the case until the season is too far advanced to allow of conveniently getting them established in the larger pots, it will be advisable to dry them off and winter them in the small pots. When it is desirable to allow the plants to go to rest, gradually withhold water; and when the foliage decays remove them to a dry place, where the temperature will not be liable to fall under 40°, which will be quite high enough for them during winter; indeed, if the soil is perfectly dry they will not hurt if protected from frost. Towards the beginning place such a portion of the plants as may be wanted for early blooming in a moist warm temperature, and get the soil properly moist, when they will soon begin to grow vigorously; and if larger plants are wanted, these will easily and speedily be obtained by keeping the blossoms picked off for a time as they appear. Other portions of the stock of plants may be introduced into heat at intervals of about a month, which will secure a succession of bloom throughout the spring and summer months. When in flower they may be removed to the conservatory or greenhouse, taking care not to place them in a cold part of the house, or in the way of draughts; where, if they are properly supplied with water, they will continue to throw up a profusion of their beautiful flowers for a long time. The best time for repotting established plants is before starting them into growth in spring, when they should be turned out of their pots, shaking away the old soil and repotting them in the same or a size larger. Be very careful in potting to secure perfect drainage, by placing plenty of

potsherds in the bottom of the pots, and covering these with some rough soil; for, like most Cape plants, this is impatient of stagnant moisture about the roots. *Alpha.*

Home Correspondence.

Cottagers (see p. 70).—Your correspondent "B." recommends boiled Rice being supplied to the poor instead of bread and coals; but surely "B." cannot have studied the evil consequences arising from such a change. Let "B." sit down and have his dinner of boiled Rice on a winter's day in a cold comfortless house, without fire, and see if he would not prefer warm bread and milk with a little fire to warm him and make the house comfortable and conducive to health. Again, would the saving of coals compensate for the diseases which a cold and damp house and unsubstantial food would have a tendency to bring on the poor? "B." says he thinks it would be a wiser plan to give the poor boiled Rice, making his suggestion to the benevolently disposed; but the age we live in admits of nothing but ocular demonstration, not supposition. It is an old byword, but a true one, that "before making a suggestion one should consider the consequences arising from that suggestion if put into operation." If "B." were to consider the consequences of the alteration proposed a little more, he might possibly be led to change his opinion respecting boiled Rice, which is good in its place, but not as a substitute for bread and coals. *R. J.*

The Late Mr. Geyer.—You will be sorry to hear of the death of Mr. Charles A. Geyer, well known as one of the explorers of North America. He died on the 21st of November last year, at Meissen, in Germany, after a severe and protracted illness. Mr. Geyer returned from North America in 1845, when he stayed several months in Kew to arrange his collections of dried plants, an almost complete list of which has appeared in Hooker's "Journal of Botany," published there by the learned editor. Mr. Geyer was so much exhausted from the great hardships he had undergone in crossing over from the eastern to the western States of America, that shortly after his arrival at Kew he had a severe attack of illness, which almost proved fatal to him. Sir W. J. Hooker, Lady North, and other residents at Kew, displayed a lively interest in him on that occasion, and Mr. Geyer was always known to speak in glowing terms of their kindness. Shortly after his recovery he went to Germany, his native country, where he became the editor of a horticultural paper the "Chronik des Gartenwesens," which he conducted with skill and ability, and rendered famous by extremely well written leading articles. Mr. Geyer was a quiet, unpresuming man, liberal in his views, and enthusiastically fond of the profession to which he had devoted his life. *Berthold Seeman, Kew.*

Spade Husbandry.—Your strictures upon the late Mr. Gisborne's essays appear to me to be rather too severe. There can be no doubt that he objected to spade cultivation chiefly on account of its costliness compared with that of the plough—and is not this a reasonable objection? We all know that the spade does its work better than the plough; so does the flail better than the threshing machine, but they are both superseded in their general uses by superior contrivances which are less expensive in their operations, and better adapted to the times we live in. Knowing then that the spade cannot be generally used as a farming implement, what wisdom is there in idolising it, and crying down the plough? The spade is pre-eminently a gardener's implement, yet even a market gardener may use the plough to advantage on certain occasions. Your remarks upon deep cultivation are excellent, but so long as you or any other persons contend that gardening can be conducted successfully without manure you are propagating a delusion. [Who says so?] This question of cultivation in the place of manure may safely be left to the real practical market gardener, but not to the gentleman gardener, who is stinted in the use of manure, and who has, of course, no anxieties about his balance sheet, as to whether he is conducting his business profitably or not. *E. S., Feb.* 8. [We find nothing to alter or explain in the observations referred to by our correspondent, as he will himself see if he reads them attentively.]

Potatoes from Seed v. *the Disease* (see p. 52).—I am sorry you did not give the seven numbered paragraphs as they stood in my paper. If you had, I flatter myself the same conclusions would not have been drawn from them, but your misinterpretation of the fourth paragraph seems to have led to all the rest. It stands thus:—"That all have a certain duration of life according to their time of arriving at maturity, which is generally between four and eight years. The early and most vigorous first, and so on in regular order of their maturation." That is, such as come to maturity in the shortest time, will be soonest to decay, like most organised beings, but I did not mean to say that the duration of the life of the Potato ranged between four and eight years, as you have given it; my opinion is, that after it comes to maturity, it may on this principle, be in perfection between 20 and 40 years, which must be ascertained by the careful observer according to the nature and properties of each variety. *John Anderson, Fermoy.* [It thus appears that Mr. Anderson did not intend to say what his words seem to mean; a misunderstanding now corrected.]

Woods and Plantations.—I have been a planter for some years, and I am much interested in the cultivation of trees; in the article in your last number, by Mr. Bailey, it is truly stated that the gentlemen of England are great losers by the mismanagement of their woods and plantations, and it has always been a matter of surprise to me that the proprietor, who would anxiously inspect his Wheat and watch the growth of his Turnips, seldom looked at his woods but with the eye of a sportsman, calculating the density of cover, and how many hares and rabbits he might kill out of them; and yet the country gentleman has a strong feeling for his pocket, and his bailiff suffers if the profit from the woods is not an annual item in his accounts. In the first place, for one well informed and skilful woodman employed, there are 10 ignorant ones—the greater part cut according to tradition—so and so was always the custom, and if ever so wrong, on they go, custom sanctifies the abuse; and as for giving a reason, that is quite out of the question. This, in old established woods, is exactly the case, and even where the management has been good for a generation or two, at times a young spendthrift comes into possession, and then, with a strong impression that timber was a kindly provision of Providence for the payment of debts, down go the old Oaks which have cost a century of care, with little prospect of ever being replaced. This brings me to the planter again, and when I see numberless bad plantations I believe it is not the planting that has been bad, but that the want of attention afterwards is the great cause of evil. Trees are inclined to grow, especially Oaks, however ill they are treated and crammed carelessly into their holes; but everything in nature must have food, and if you leave 3000 on an acre of land, only capable of feeding the half, and proportionably less every year, for the tree requires more food as it increases in size, you put them through a process of smothering and starvation, under which few can exist and none thrive; and this is the treatment in numberless plantations, and I am forcibly reminded of a very large tract of planting north of the Tweed, where from difficulty of access, and small demand, they were left to nature, the survivors in the struggle to remain possessors of the soil. My impression is that the want of judicious and frequent thinning is the cause of the many unhealthy plantations we see; nor is it an easy matter for the skilful woodman to remedy the evils of a long existing neglect. The unskilful soon makes bad worse. Mr. Bailey proposes to offer a few remarks upon the modes of managing woods and plantations, which I shall be anxious to read. He must, if he looks northward, be resigned to give up all hedgerow timber, the Scotch families will not hear of it, nor do I admire Mr. Barron's plan of planting corners; plant masses, and plant them well. I have no doubt Mr. Bailey may give many useful hints. I have some of my own, which I may trouble you with at some future time; but I have seldom read of a style of planting less promising than that which your correspondent "W. B. A.," states as being adopted by certain royal foresters, as quoted from the Blue Book of the Woods and Forests. I must not trespass longer upon you at present, but that is so wide a field for censure rather than discussion, that it would require another blue book to contain it, instead of a corner in your paper. *Newstede.*

Bates' Broccoli.—I observe that you have noticed my Broccoli in your last report of the Horticultural Society's Garden, but the name is unfortunately misspelt, it should be "Bates'" improved, not "Betts'." *Charles Bates, Molesey.*

The late Storm in Lincolnshire.—Thermometer taken at 9 P.M.:—

January 1	—Heavy fall of snow	8° of frost.
" 2	—Slight showers of snow	27 "
" 3	—Showers of snow	12 "
" 4	—Very stormy, with heavy fall of snow	8 "
" 5	—Showers of snow	6 "
" 6	—Showers of snow	5 "
" 7	—Showers of rain, A.M.	3 "

Vegetables have suffered to a great extent, more especially Broccolies and greens, more than three-fourths of which have been destroyed. Shrubs have also sustained great injury. Laurustinus of 16 years' growth have been killed to the ground; Sweet Bays the same. Deodars have lost their young shoots; young plants of Cupressus lusitanica have been killed, while old plants of the same Cypress have lost their young shoots. Most of the foliage is dropping off common Laurels and Hollies, and Phillyrea ligustrifolia in a sheltered situation is also nearly stripped of leaves, while the points of its young shoots are killed. The garden and grounds here are well sheltered, but rather wet. *D. Lumsden, Bloxholm Hall, Lincoln.*

Royal Victoria Melon.—This appears to me to be the same as the "Victoria Melon" reported on in the *Chronicle*, p. 600, vol. 1852, and said to have been imported by Messrs. Weeks of Chelsea. I had a few seeds of it from that firm in February, 1853, which I sowed along with the Beechwood and Fleming's Hybrid. The Royal Victoria has all the beauty and thinness of skin attributed to it in the report alluded to, and it is early, coming in 10 or 14 days before either of the above-named sorts. It requires an abundance of air, otherwise the Vine is apt to spindle and become weak, in which case good useful-sized fruit need not be expected. In flavour it is superior to the others, causing it to be inquired for in preference to them by the housekeeper here. It was in productiveness, however, that it most excelled, and this, coupled with its other good qualities, cannot fail to cause it to be grown in preference to many other varieties, especially for the purpose of preserving. *John Richardson, Parham Park, near Starrington, Sussex.*

Societies.

Linnean, *Feb.* 7.—The President in the chair. Mr. E. Newman exhibited fructified specimens of Ophioglossum lusitanicum, Lin., which had been recently found by Mr. Walsey in the island of Guernsey, as noticed by Mr. Smith at p. 53 of our present volume. The early growth of the plant, which bore perfectly developed fructification at this early period of the year (January), is remarkable. The following papers were read: 1. Note on the Elaters of Trichia; by A. Henfrey, Esq. This paper had reference to the question of the existence of spiral fibres in the filamentous elaters mixed with the spores of Trichia and some allied genera of fungi, noticed by Corda, but recently called in question by two distinguished vegetable anatomists—Schleiden and Schacht. Hedwig, in 1802, was the first to point out the existence of these spiral fibres in three species of Lycoperdon, which Schlechtendal identifies as Trichia rubiformis, Fries, T. chrysosperma, Fries, and a Diderma. Him followed Kaulfuss, who wrote in 1822, "According to my investigations the structure of the so-called capillary tissue of the Trichiaceæ, is exactly the same as that which we find in the elaters of the Hepaticæ. Corda made known his observations to the same effect in 1837. A notice, without figures, but asserting the existence of the spiral fibres was published by Schlechtendal in 1844. On the other hand, Schleiden states, that observations recently repeated have convinced him that the appearance of spiral fibres arises from the twisting of a flat band; and Schacht takes the same view. Mr. Henfrey had examined the elaters of Trichia serotina, Schrad, in some specimens sent from New Zealand by Mr. Ralph, and asserts positively the existence of the disputed spiral fibres, which are, he states, exactly analogous to those of Marchantia polymorpha. The fibres thin off toward the ends of the elaters, and apparently become confluent there as in the Marchantia, but are so fine at the ends that a power of 1000 diameters did not define their terminations. The author had decisively observed the tubular character of the elaters, even before defining the fibres. The spiral structure was clearly distinguishable with a power of 250 diameters, but in order to count the fibres, it was necessary to mount the elaters in the thinnest possible film of liquid, under very thin glass, and apply a magnifying power of 1000, when the individual fibres became sufficiently defined to be drawn with the camera lucida. These elaters, Mr. Henfrey remarks, may be regarded as very good test objects for the defining power of the higher object glasses, and even as tests of the value of observations made on the more difficult tissues. Viewing them in this light, he observes that either the microscopes or observing powers of Schleiden and Schacht must be imperfect; and since it is known that the latter is not the case, it follows that "their observations on very highly magnified bodies must be received with great caution until they provide themselves with better instruments." 2. Notes on the Habits of Medusæ with regard to Small Fishes, by C. W. Peach, Esq. The object was the show, from the observations of the writer, that the young and minute fish find shelter and protection beneath the medusæ, instead of being devoured by them, as is currently stated. 3. On the officinal species of Senna, in a letter from M. J. B. Batka, of Prague, to G. Bentham, Esq. The author separates Senna from the genus Cassia, and recognises four officinal species, of which this letter contained the characters and synonymes. These were as follows:—Senna obovata, which has obovate, or retuse-obovate leaflets, and lanceolate-linear stipules, and is a shrub inhabiting the deserts of Egypt and Tripoli, extending to Syria and Senegal. It forms the commercial Senna of Tripoli and Aleppo, and is frequently mixed with Alexandrian Senna. S. acutifolia, which has oval-lanceolate, acute leaflets, with a hairy costa, and hairy, linear-subulate stipules; it is the Alexandrian Senna of commerce, and is a shrub inhabiting Egypt and Sennaar. S. angustifolia, which has narrowly-lanceolate, smooth leaflets, and subulate stipules, is called Mecca and oriental Senna; it is a shrub growing in Arabia-Lohayæ, Mocha, and Yemen, and at Agra, in the East Indies, and is cultivated at Tinevelly and Calcutta. S. tomentosa has ovate, oblong, pubescent leaves, and hastate stipules, and is a shrub found in Arabia and Nubia; the leaves are found mixed with the Mecca Senna, and rarely with that of Alexandria.

Botanical of Edinburgh, *Jan.* 12.—The President in the Chair. The following papers were read:—1. On Diatomaceæ found in the Mull Deposit; by Professor Gregory. 2. On the occurrence of Desmarestia Dresnayi on the coast of Ireland; by W. Sawers, Esq., Londonderry. 3. Remarks on the Flora of the Vosges; by Dr. Dubuc. 4. On Carex pediformis and other new Austrian plants; by Dr. Adolph Senoner. 5. Report on the state of the Society's Herbarium; by Dr. Anderson, curator. Several new members were elected.

Notices of Books.

Voyage dans le Nord, &c. (*Journey into the North of Bolivia and the adjoining Parts of Peru.*) By H. A. Weddell, M.D. 8vo. Bailliere.

Dr. Weddell's important contributions to our knowledge of the Natural History of South Western America have, on several former occasions, been noticed in our columns. His magnificent work on Cinchonas must more especially be familiar to all who are interested in

such subjects. His ready pen has now produced a highly interesting account of the visit paid by him to the gold field of Tipuani in the year 1851. This place is situated on the eastern slope of one of the highest peaks of the Andes. Thence issues a stream whose sands sparkle with scales of gold, rushing down from the snows of the Cordillera till, at 30 leagues from its source, it loses itself in one of the tributaries of the Amazons. It is to this Bolivian Pactolus that the name of Tipuani is given, whose sand is said to yield in no respect to the richest alluvials of California or Australia.

The village of Tipuani is described as a miserable filthy place, rich in fever as in gold; it consists of 50 or 60 houses, chiefly built of Palm tree logs, thatched with Palm tree leaves, and sometimes partitioned with Bamboo; the market place resembles a Grass field; the church is a hovel, and the price of all articles of food exorbitant, compared with the usual run of Bolivian charges. Rice, chocolate, and rum or *resacado*, are cheap enough. In the sands there gold is reported to be abundant, occurring in scales (*lentejuelos*), dust (*oro soplado*), and nuggets, the heaviest of which ever found weighed about 5 ounces. The quantity of gold is, however, very uncertain. M. Weddell was told that in 1798 12 lbs. 15 oz. had been taken out of one fissure in the rock; that in 1809 a couple of bowls of sand had yielded 29 lbs. 4 oz. of scales; and that in 1819 two square yards of a rock-vein or *venero* had produced 53 lbs. 14 oz. of the precious metal. These, however, seem to be very exceptional cases, for it appears that the whole value of the gold raised at the Quebrada of Tipuani between 1823 and 1842 was 8,046,920 francs, the cost of getting being 6,234,965; so that the profit realised in 20 years was rather more than 72,000*l*.

It must not be supposed from what we have said respecting Tipuani that gold was the only subject which engaged Dr. Weddell's attention. On the contrary his pages, rich in information concerning the customs as well as natural history of the wild regions he traversed —will well repay perusal. We particularly recommend to our dancing friends his account of a ball at La Paz, and of the way in which the gentlemen are fusilladed by the ladies, and how at last the ladies are themselves fusilladed *en masse* by the surviving gentlemen. The account, too, of the Coca, a leaf which in Peru replaces tea, and of which the annual consumption in the province of Yungas alone amounts to 9,600,000 Spanish pounds, is by far the best relation we have seen of the history of that remarkable drug.

The Bon Jardinier for 1854 has now assumed the convenient form of two thick duodecimo volumes, a great improvement upon its former awkward shape. The issue for this year is introduced by 70 pages of novelties, from which we shall occasionally make extracts. The work itself is of the greatest utility to cultivators of every class, and we are quite surprised that it should be so little known in England. As a mere dictionary explaining the meaning of common agricultural and horticultural words, it deserves a place in every good library of reference. All that the reader has to bear in mind is the rather important fact that the observations apply to a French not English climate. The editors are the two Vilmorins, Decaisne, Neumann, Pepin, and Poiteau, all men of European fame.

Gorrie's Illustrations of Scripture from Botanical Science (12mo, Blackwood), is an unpretending attempt to illustrate scriptural texts by explanations derived from vegetable physiology and systematical botany. As the author is not only well read but a man of practice as well as science, the subject is successfully treated in his hands, so that the book is really a useful addition to the class of writings to which it belongs.

White's Selborne Illustrated (small 8vo, Routledge), is a volume richly decorated with figures of the animals and other natural objects on which the celebrated author wrote. The editor (the Rev. J. G. Wood) informs us that it is "intended principally for the use of the young, or the general reader," and to them it will be a charming gift book. We could have wished, however, that the so-called portraits of trees had been omitted, for they have in most cases no resemblance to the originals, and only disfigure the pages in which they are placed. In other respects the cuts, of which there is a great number, are satisfactory and instructive. There is also a good index. We have, therefore, little doubt that this will be one of the favourite editions of one of England's favourite writers.

New Plants.

45. CEROCHILUS RUBENS.

CEROCHILUS. (Neotteæ, Physuridæ.) *Perianthium* galeatum, subglobosum, apice patulum. *Sepala* lateralia dorsalia; omnia basi ima connata. *Petala* unguiculata, obliqua, libera. *Labellum* posticum, ventricosum, carnosum, clausum, apice difformi angusto emarginato, juxta columnam cujus faciei omninò adnascitur ante stigma biauriculatum intùs bicallosum. *Columna* nana reclinata; antherâ intra marginem clinandrii membranaceum semiabditâ; rostello acuto. Pollinia 4 —— *Caulis* foliosus. *Scapus* terminalis. *Habitus* Goodyeræ.

C. RUBENS.

The native country of this is unknown; it has lately flowered with R. Hanbury, Esq., at Poles, where it has been growing for about two years among other imported Orchids; but the history has been lost. In appearance it resembles Goodyera procera, but is not so tall, and is covered all over the scape and inflorescence with long soft hairs. The leaves are ovate, acute, fleshy, obscurely three-nerved, with a channelled petiole. The spike is about 3 inches long, with membranous acuminate pink bracts, of which the lowest are as long as the ovary. The sepals are dull green and downy, turning back at the upper end, where they are white, except the dorsal, which have a bright rose-coloured middle line. The petals are of the same colour as the anterior sepal—green turned up with white. The lip is bright yellow, of the texture of very firm wax, with a free emarginate apex, but otherwise closed up in consequence of the edges meeting in front, and its whole face being firmly united to the face of the column, except a pair of small free sigmoid ears, which turn inwards just in front of the stigma. In its interior, which is filled with honey, is a pair of rugged fleshy callosities.

From all the race of *Cranichids* this genus differs in its lip and acute rostel. Among the ventricose *Physurids* it is distinguished by its dorsal lip; it is not referable to *Myoda*, because its sepals are neither petaloid nor reflexed; and from both *Hylophila* and *Ætheria* it is separated by the peculiar adhesion of the lip to the column. It is upon the whole more like *Monochilus nervosum* than anything else I am acquainted with; and is therefore in all probability of East Indian origin.

Garden Memoranda.

MESSRS. HENDERSON'S NURSERY, PINE-APPLE PLACE.—The show house here is already gay with Hyacinths, among which Grand Vainqueur, white; Nimrod single, blue; and Mars, red, were conspicuous; also spring-flowering Heaths, Cinerarias, Linum trigynum, which is a really useful plant at this season; Genista racemosa, Chinese Primulas, both single and double; Narcissi, and the Oleander-leaved Eriostemon. The pretty little Cyclamen coum has likewise been in full bloom ever since Christmas. Of this variety too much cannot be said; it is exceedingly beautiful, and no greenhouse should be without it. In a long span-roofed house was a number of plants of the Sikkim Rhododendron ciliatum, well set with flower buds. Though quite hardy this is a neat kind for a pot; it occupies little room, and is therefore very suitable for small houses, in which variety is an object. A degree of elegance was imparted to the flat front shelf of this house by introducing here and there among the small plants which it contained the variegated Aloe-leaved Yucca, whose fine heads of yellow-striped leaves set on thick gnarled trunks, a foot high or so, gave the whole quite an exotic appearance. The stove is becoming gay with Amaryllids. By potting these at different seasons they may be had in succession for a long time, and the display which they make should not be overlooked by those who are fond of showy flowers. Æschynanthus ramosissimus was likewise in blossom, as were various Begonias and Thyrsacanthus rutilans, a scarlet flowered plant which promises to be very useful. The red-leaved Dracæna ferrea and terminalis served to enliven the monotony which too commonly prevails in plant houses during winter and early spring. Some small coloured glass vases suspended from the roof, and filled with Lycopods, Ferns, and plants of that sort, were also objects at once striking and interesting, and we should think their skilful introduction into plant stoves generally would help to break the uniform appearance they too often present. In the Heath house a few of the early varieties were in blossom, and in the specimen house Styphelia tubiflora, Correa picta superba, and one or two other plants, were objects of considerable beauty. In the Orchid house there was little to admire in the way of flowers; but the plants looked healthy and clean. In the open ground very little was in blossom except the bright yellow Jasminum nudiflorum, which was trained against the end wall of one of the stoves, where it has been beautifully in flower for some weeks past.

EALING PARK.—We regret to learn from Mrs. Lawrence that our reporter has been under a misapprehension as to the facts connected with the Amherstia nobilis here. That lady says, "It is a mistake to state that it had lost all its leaves after the house had been smoked with tobacco. It is true that after smoking some time ago it lost a small quantity of young leaves, but it continues to be well covered, and has above 2000 leaves upon it. It has been flowering ever since New Year's day, and will continue to do so some time longer; and the flowers this year have been unusually rich, and of the brightest possible colour. There were scarcely any flowers on it when your reporter saw it, as they had been that morning cut off, and sent with some flowers of Orchidaceous plants to the Queen."

FLORICULTURE.

TREATMENT OF THE RANUNCULUS.—What can be gayer than a bed of well-grown Ranunculuses? Their fine forms, richness, and diversity of colours claim for them universal admiration; and yet singular as it may appear, with all their attractions, they are not half so extensively grown as they deserve to be. If lovers of floral beauty, however, were once to pay a visit to the magnificent collections of Messrs. Tyso, Lightbody, and others, when these are in the height of their bloom, I feel satisfied that they would never rest contented until they had a bed in their own grounds to view at their pleasure. I am aware that the Ranunculus has been termed by many a shy and uncertain flower, which in fact it is, if planted without trouble or care, and afterwards left to chance, but under skilful cultivation it will be found to blossom most profusely. The only difficulty is in getting up the tubers at the proper time, when sufficiently ripe, and preserving them as plump as possible until planting time, which being now close at hand, a few brief remarks as to the best mode of culture may not be out of place. The situation for the beds, which are best prepared in autumn, should be a moist cool place, where they will only be subjected to a few hours' morning sun, bearing in mind that a moist subsoil is required in order to ensure successful cultivation. The place being selected, remove the old soil to the depth of nearly 2 feet and 4 feet in width; sods cut from a rich old loamy pasture to the depth of 3 or 4 inches and about 16 inches wide should then be laid at the bottom to form the foundation of the bed, treading them firmly down. The remainder should be filled up with the same compost collected a few months previously, and turned several times before using it. To this may be added a portion of well decayed cow-dung and leaves, and if the loam is rather stiff a portion of sand may be introduced. This should also be pressed firmly down, and the whole may remain in that condition till planting time, the beds should be little above the level of the surrounding ground, and in order to give them a neat appearance they should be edged round with slate. Fork the soil over lightly previous to planting, but not exceeding 2 inches in depth. Planting should never be deferred after the middle of this month, and the roots will be benefited by being placed in the light a few days before they are put into the bed. Embrace the first opportunity of a fine day to make the beds and get them perfectly level and marked neatly out previous to planting, in order that the roots may be put in at equal distances; they should be placed about 5 inches apart and 6 inches asunder row from row. It is better to give them a little extra room at all times than to overcrowd them. If the collection is small they may be dibbled in with the finger, carefully set with the prongs downwards, and covered over about 1½ inch deep; but if the collection is extensive drills should be drawn at equal distances across the beds, placing the roots at the bottom of them, and covering them with the loose soil; as soon as the plants appear above-ground, which will be about April, the surface soil should be carefully and firmly pressed round about the roots, and if the weather should set in very hot in May the beds should be carefully watered, in order to prevent the soil from cracking; old tan placed over the beds at this stage of growth will also be found very beneficial. In order to prolong their blooming season a temporary shading should be erected over them, just sufficient to protect them from the hot sun and rain, but the beds should nevertheless be kept in a moist state. Wireworms often attack the roots, and therefore they must be guarded against. As soon as the foliage has begun to decay protect the beds from wet, or the roots may be excited to grow again, which would be very injurious to them. The most essential point connected with their cultivation is, as I before observed, taking up the roots and properly storing them away. They should be lifted as soon as the foliage has turned quite yellow, and stored away in a dry airy situation, drying them as gradually as possible, in order to keep them plump. When sufficiently dry they may be placed in drawers, in order that they may be easily looked over, still bearing in mind that a cool but dry atmosphere is the only means of preserving them in a sound state. *E. B.*

THE POLYANTHUS.—It has always been a source of much astonishmeut to me, that so few really fine Polyanthuses have been raised, considering the very great quantity of seed annually sown. How many of what are considered our best Polyanthuses are eminently faulty! For instance, among our best sorts, Alexander is coarse and uncertain; Bang Europe bleaches on the lace long before the flower fades. Fletcher's Defiance is also similarly defective; in Lord Crew (Lakin's), the yellow or ground-colour is much too large in proportion to the body-colour; Lord John Russell, which I believe to be synonymous with Hufton's Earl Grey, is termed "foxy," that is, a tinge between the body and ground colours, wanting decision of character; Collier's Princess Royal is apt to sport in the number of segments in the corolla, some pips having five, others six—the latter number giving it a frilled and rough appearance; George the Fourth (Buck's), is often very coarse From this may be seen how much we need improvement and I make no doubt each of the sorts I have enumerated has been raised 20 years. Now I would cross good pin-eyed seedlings with one of the best of these, say Buck's George the Fourth; I would by no means use farina from Bang Europe or Defiance. George the Fourth has size, form, and good constitution to recommend it, and with larger and neater flowers would doubtless soon produce some valuable varieties. *M.*

DAHLIAS. Can any of your correspondents inform me of the name and colour of some dwarf Dahlias, not more than 2 feet high, and where they are to be procured? I have Zelinda. *J. Speed, Edmonton.*

Miscellaneous.

Notes on the Grape Mildew.—M. Rivet (*Comptes Rendus*, Nov. 1853), states that in 1847 he was invited by Dr. Loze to examine a sort of wine to which extraordinary properties were attributed. Another invitation to the same effect was received, in 1849, from M. Souleyet, who spoke highly of the efficacy of this wine in curing some diseases. M. Rivet found iodine in the wine; and he learned that the Vines which produced it were not attacked by the Oïdium, and that M. Mouriès had effected remarkable cures among Vines by manure containing iodine. Having made some experiments the following facts were elicited:—1st, Manure produced by the fermentation of marine plants has been employed in some parts of Spain since 1835. The soil which has

received this manure contains, on the average, $\frac{1}{50000}$ part of iodine. The Vines which grow in it have never, up to the present time, been attacked by the Oïdium. 2d, The wine made from these Vines has some peculiar qualities. In commerce, where it is rare, it bears the name of Malaga Rives de Mer. It is of all vegetable productions the richest in iodine, containing, on the average, $\frac{1}{50000}$ part of that principle. 3d. Iodine found naturally in plants or animals possesses an action which, by its nature and intensity, cannot be produced by its chemical preparations. M. Didot pointed out the absence of Oïdium on Vines the wood of which had been smeared over with coal tar. [This, we think, is rather a dangerous application, for some fruit trees have been killed by it.] M. Lapierre-Beaupré stated that according to his observations the mildew does not attack the stem; the Vines which were diseased in 1852 even appear to have for the most part escaped in 1853. It was stated by M. Pascal that acetate of lead prevents the development of Oïdium and other Cryptogams. M. Sourdette proposes a simple and inexpensive preservative, which has proved successful in some experiments made during two years in the neighbourhood of Bordeaux. In order to prevent and arrest the development of the Oïdium it is sufficient, three weeks after pruning the Vine, to smear the stem and shoots with pure liquid tar, applied with a large brush. This operation costs very little, and has proved very successful on all the plants on which it has been performed, even although they were in the midst of infected Vines. *Comptes Rendus, Nov. and Dec.* 1853.

Poireau Jaune de Poitou.—A very large sort of Leek, some of the leaves being more than 6 inches broad and 5 feet long, measuring from the lower part of the stem; they are of a yellowish green colour. The stem blanches yellowish white, and its substance is more tender than that of other varieties. It requires to be planted farther apart than usual, owing to the size of its leaves. As it grows large and is of tender quality, it deserves cultivation. *Journal of Hort. Soc.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Conservatory, &c.—Plants in active growth may be repotted, but provision should be made for this without exposing them to the external atmosphere, and there should be a good supply of soil, &c., in a proper state, at about the same temperature as that in which the roots of the plants have been growing, ready for use when wanted. The whole of the repotted stock should be so placed as to be readily examined, and carefully supplied with water for a few weeks after potting, and they will be benefited by a gentle sprinkling with the syringe on the mornings of fine days, but use the syringe sparingly until the weather becomes bright. Any of the Orchids that may have commenced growth should be repotted or top-dressed, as may be required; for if this is deferred long after the commencement of growth, there will be great danger of injuring either the buds or young rootlets. Give a gentle syringing to plants on blocks, but only sufficient to prevent shrivelling; such as may be in growth will require a more liberal supply. See that the foliage of the plants, &c., is perfectly clean, and persevere in trapping and destroying insects. Greenhouse.—Attend to shifting Pelargoniums, Calceolarias, Cinerarias, &c., before they get too much pot-bound, or suffer for want of sufficient space for their roots; and if green-fly is perceived upon any of the plants, fumigate at once. Rearrange and turn round specimen plants occasionally, so as to expose all sides equally to the influence of light and air, and keep the surfaces of the balls and pots clean, for nothing tends more to promote damp and mildew than dirty pots, and allowing Lichens, &c., to grow on the soil. An occasional handling of the specimens is also useful in enabling the cultivator to discover if they are all right as regards water. Take advantage of unfavourable weather for out-door work, to wash pots, and provide a good stock of all requisites for potting, so as to have them in readiness when wanted.

FORCING DEPARTMENT.

Pinery.—Where fermenting materials are used for affording bottom heat, watch carefully such beds as may have been recently renewed, and if the heat at the bottom of the pots rises to 90°, the pots should be raised at once, in order to prevent injury to the roots. It is now less usual than it once was to subject the roots of Pines to a temperature of 110°, but it is still too common to allow them to suffer from excessive heat, and thus to throw them prematurely into fruit, or otherwise to greatly injure them. Much of the want of success experienced in the cultivation of these is the result of subjecting their roots to a baking-heat. A steady bottom heat of about 85° should be maintained during the growing season, but depend upon it that any excess over 90° will be highly injurious to the plants. Maintain a moist state of the atmosphere, and see that the soil about the roots of growing plants is not allowed to become too dry, but use the syringe very lightly until we have more sun to dry the hearts of the plants. Vineries.—Admit a free circulation of fresh air on mild bright forenoons, but be careful to open all the ventilators a little, and not to admit cold air by large apertures, which could hardly fail to injure the tender foliage. Shut up early in the afternoon, allowing the temperature to rise with sunshine to 80°, in houses where the Vines are in bloom and those farther advanced. Maintain a moist atmosphere, but discontinue the use of the syringe as soon as the blossoms begin to expand, and, unless where there is danger of red spider, it should not be used until the berries are ready for thinning, when a gentle washing will be of great service in removing the decayed flowers from amongst the berries. Give Vines in pots a liberal supply of manure water.

FLOWER GARDEN AND SHRUBBERIES.

Every gardener should decide at once upon the arrangement of the flower garden for the coming season, and provide the family with a plan coloured, as nearly as possible, as he intends the masses to be, and obtain their opinion of it, making any alterations which may be suggested until it is as satisfactory as the existing stock of bedding plants will allow of. This done sufficient stock of plants of the colours required may be provided, without occupying space with useless things, and should the arrangement not prove quite satisfactory the blame will not fall altogether on the gardener, and this will compensate for any loss of credit which some may suppose to result from consulting the family in a matter of this kind. But by consulting the family at the proper time there will be little difficulty in making sure of rendering the flower garden satisfactory to them. Keep gravel walks and Grass clean and smooth by sweeping and rolling as frequently as may be necessary. If any slight alterations are purposed let them be proceeded with as expeditiously as possible, and where various trifling alterations have to be effected, concentrate the strength upon one until it is finished, and avoid, as far as possible, rendering the place uncomfortable and untidy by having several jobs, and the consequent litter, &c., about at once.

FLORISTS' FLOWERS.

Hollyhocks, in the open ground, should be looked over, all dead or decaying parts cut away, and some well decomposed manure forked in around them. Ranunculus.—Plant the reserve beds of small roots as soon as the ground is sufficiently dry: a few days earlier or later is not of so much importance as the proper condition of the bed. Tulips are remarkably late this season: cover on the appearance of frost, or place a small quantity of sand over the protruding spike. Carnations and Picotees.—These may have a little more water: make every preparation for potting: get the compost under a shed, so that it may be kept dry, and in wet weather it may be carefully turned and examined for wireworms. Both Pinks and Pansies appear to have withstood the frost well in the open ground, and require but little attention just yet; those of the former in pots for blooming early must not be coddled, a system which destroys more florists' flowers than all the weather.

KITCHEN GARDEN AND HARDY FRUIT DEPARTMENT.

The main crop of Potatoes should be got in as soon as the state of the ground will admit. The experience of past years should have taught every person the impropriety of planting these upon fresh manured land; and, although a heavy crop of the early sorts cannot be obtained unless the soil is in good condition, the use of strong manures should be avoided for these. By selecting a piece of ground that was well manured last season for a green crop, and giving this a good dressing of charred refuse, or wood ashes, previous to planting the Potatoes, it will be found greatly preferable to using rich stimulating manures: and, except for the weakly growing early kinds, as the Ash-leaved, ordinary garden soil, in its poorest state, is too rich to produce Potatoes of anything like good quality. Look sharply after recently-planted Peas, and protect them from the depredations of mice. Bring forward Lettuce-plants, Cauliflowers, &c., in a gentle heat, and endeavour to get them strong and well hardened off for planting out by the middle of March. The late severe frosts have made sad havoc with these things in many places; but there is no help for this, except supplying their places with the least possible delay. Finish pruning and nailing, and the root pruning, or lifting of trees, without loss of time.

COTTAGERS' GARDEN.

If not already done, the trees on the cottage wall should be pruned and neatly nailed, for although cottage garden wall trees—especially Apricots—are often remarkably fruitful, they are not always so neat in appearance as they ought to be, and crooked ill-placed shoots can hardly be supposed to contribute much to fruitfulness, and they are very unsightly. Any spare ground which has not yet been dug should be turned over as early as circumstances will admit, so as to get the soil pulverised by the action of the weather before planting time. And, as the cottager cannot always find manure to give his ground an annual dressing, although he requires to crop it heavily, he should trench it every second or third year, which will be more beneficial to many crops than a heavy dressing of manure. But if the subsoil is stiff clay, marl, or hungry gravel it should not be brought to the surface, but turned over in the bottom and allowed to remain there, as bringing it to the surface in the usual way will ruin the ground for years.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Feb. 9, 1854, as observed at the Horticultural Gardens

February.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Of the Air. Min.	Of the Air. Mean	Of the Earth. 1 foot deep.	Of the Earth. 2 feet deep.	Wind.	Rain.
Friday 3	6	30.327	30.241	33	21	27.0	40	42½	N.E.	.00

Satur. 18	45.2	32.1	38.6	11	0.30	4	1	3	1	4	7	6	2

The highest temperature during the above period occurred on the 12th 1831—therm. 68 deg.; and the lowest on the 12th, 1847 — therm. 9 deg.

Notices to Correspondents.

Aquilegias: *A H.* Several Aquilegias inhabit California; A. canadensis, or what is taken to be it; leptoceras; formosa; all which, or at least the two first, are in cultivation.

Blight: *J P B.* What you call "blight" is ill health, caused by bad cultivation. The few aphides straggling among the leaves cannot, we suppose, have brought your plants to such a pass. If they did, you should have attacked them with tobacco smoke long ago. Look to the roots.

Churchyard: *E G.* The plant is the oriental Arbor-vitæ, a very proper plant for a churchyard. But specimens of the size you describe should be moved in August, not at this time of year.

Diseases: *Omicron.* Without specimens of the leaves of your Plum trees, it is impossible to speak with certainty of the disease with which they are attacked; it is, however, probable that the rusty appearance arises from the presence of a little Puccinia, respecting which we shall hope to give a more specific answer should your trees be diseased this summer, provided you are so good as to forward some of the infested leaves. In your diseased Laurel leaves we find no parasite; and, since they are similarly attacked at all seasons, the decay is probably due to some peculiarity in the soil, or want of proper drainage. The leaves you have forwarded are particularly flaccid, and appear to have grown too rapidly to admit of a proper solidification of their tissue, as if the soil were too rich. Without personal inspection, however, it is obviously impossible to speak positively as to the cause or to suggest any remedy. *M. J. B.*

Forest Trees: *J W U, Limerick.* Ivy does no harm unless it obstructs light and air; in that case it should be removed. But if the trees are old enough not to be so affected its presence is of no consequence.

Fruit Trees: *A B.* For the the back wall of your Vinery the White Marseilles and the Brown Turkey Figs will probably be the most suitable. If you prefer the Guava (Psidium Cattleyanum), you may grow and fruit it very well in the above situation.—*J S.* Not received.‖

Gold Fish: *Sub.* There can be no difficulty in constructing a small pond for them; but if you have only a few, a plan by which they can be seen perhaps to most advantage is to erect four low brick piers on your lawn, and place a glass cistern with transparent sides and open top on them. They will thrive in this quite as well as in a small pond, provided the water is changed now and then, and they have a little shade in summer. A contrivance of this kind is capable of being made very ornamental.‡

Grafting Vines: *D W.* The Black Hamburgh may be grafted on the Muscat, but it would be preferable to have it on its own hardier root. Graft the Vine as you would Apples or Pears, but with the following precaution to prevent bleeding. Presuming that you have cut back the shoot or branch to where you wish to graft, an eye will push on the part left, just below the section; allow the shoot to grow a few inches, and then put on your graft opposite to it; when the latter shall have pushed a few leaves bleeding will not take place, and the shoot of the stock may then be stopped.‖

Mushrooms: *Reader.* The most certain plan would be to make a new bed. If, however, you have any means of applying heat, either in the shape of dung linings or otherwise, to the one you have, you may still perhaps succeed.

Names of Plants. We have been so often obliged reluctantly to decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*Deodar.* 1, Pinus, perhaps inops, uncertain; 2, Abies cephalonica; 3, Abies Morinda; 4, Juniperus recurva. ¶

Names of Fruits: *T B.* 1, Hughes's Golden Pippin; 2, Court of Wick; 3, Early Nonpareil; 4, Golden Russet; 5, Wheeler's Russet; 7, King of the Pippins; 8, Nonpareil; 9, Coe's Golden Drop; 11, Blenheim. The Grape is the true Oldaker's St. Peter's. Pear: the Easter Beurré.‖

Pavement: *L J.* We advise you to employ Minton's marl-hexagons. They are not expensive and can be had of different colours. Our personal experience teaches us that they not only wear well, but resist changes in weather so well as to be perfectly suited to out-door paving. Gravel is not a good material for in-door work, even if it is of the most binding kind. Red bricks don't wear well. Walks made of Portland cement are better, and perhaps we ought to recommend that substance, if upon inquiry you find marl-hexagons too dear.

Pears: *Novice.* On an east wall in your good soil and climate, the Winter Nelis, Van Mons Leon le Clerc, Beurré d'Amanlis, Thompson's and Knight's Monarch, will doubtless succeed well. The Marie Louise and Easter Beurré had been allowed to remain too long on the south aspect, otherwise they ought to have been as good as the others you mention ‖

Rendle's Price Current. We have received some very long letters from Mr. Rendle, for which we are quite unable to find room. We see no reason either to alter the (not unfavourable) opinion expressed of his list in our columns, or to prevent others giving theirs. Gentlemen who commit themselves to print must be prepared to take criticism as it comes, without the opportunity of reply. Of all that Mr. Rendle is anxious to say, we can only find room for the following words, "If you will refer to our Price Current (p. 5), you will see that Mr. Drummond's arguments have been fully answered;" upon which we must remark that what is called an answer is an excuse.

Spirits of Tar: *Antwerp.* The scientific name of this substance is Oleum Picis Liquidæ.

Strawberries: *Inquirer.* We are unable to say what is the cause of all the flowers that have opened on your Strawberries being green instead of white, except it be that you have grown the plants too fast, and given them too much manure water.‡

Misc: *William Oliver.* An advertisement the length you mention would be 4*s.* 6*d.* or 5*s.* 6*d.* Post-office order payable to James Matthews.

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton; Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*

Office, 69, King William Street, City, London.

N.B. Genuine Peruvian Guano, guaranteed to contain 16 per cent of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

PERUVIAN GUANO, the guaranteed import of Messrs. ANTONY GIBBS AND SONS, Lobos Island Guano, Superphosphate of Lime, and all Artificial Manures, Linseed and Rape Cakes, &c.—WM. INGLIS CABNE, 10, Mark Lane, London.

SEWAGE CHARCOAL MANURE.—This highly fertilising Manure, which is Peat Charcoal completely saturated with London Sewage, will be found most efficient for every species of crop; more especially for Peas, Beans, Turnips, Mangold Wurzel, and other root crops. It will produce a greater return for the outlay than Guano or any other Manure at an equivalent value: it also possesses the property of retaining its fertilising power longer than other Manures now in use. It may be obtained from the SEWAGE MANURE WORKS, Stanley Bridge, Fulham, at 60*s.* per ton, and in quantities less than half a ton, at 4*s.* per cwt., for ready money only, and in quantities not less than a ton, will be delivered at the London Termini of the Railroads free of charge for cartage.

It may also be had from Messrs. G. GIBBS & Co., 26, Down Street, Piccadilly, Agricultural Seedsmen, and from all the other Agents of the Company. Recommendations and Testimonials may be seen at the Works.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PURSER, Sec.

Bridge Street, Blackfriars.

ARTIFICIAL MANURES, &c.—Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.

Gentlemen desirous of receiving instructions in Chemical Analysis and Assaying, will find ample facility and accommodation at the College.

PEAT MOSS CHARCOAL, AND OTHER MANURES.—The Undersigned are appointed sole Agents by the Peat Moss Charcoal Company, for the sale of this valuable fixer and distributor of ammoniacal matter.

Also on Sale, Peruvian Guano, Superphosphate of Lime, Gypsum, Nitrate of Soda, Bone-Dust, Sulphuric Acid, and all other Manures of known value.—Apply to MARK FOTHERGILL & Co., 204A, Upper Thames Street, London.

SUPERPHOSPHATE OF LIME MANUFACTURED BY MR. J. C. NESBIT'S IMPROVED STEAM MACHINE. The following is the analysis of an average sample.

"College of Chemistry, Agriculture, and General Science, 38 & 39, Lower Kennington Lane, London.

Analysis of Sample of Superphosphate of Lime from Mr. Jolliffe:—

Moisture		13.97
Organic Matter, &c.		21.98
Silica		6.05
Phosphate of Lime		35.27
SOLUBLE	16.10	
INSOLUBLE	19.17	
Sulphate of Lime, &c....		22.73
		100.00
Nitrogen (equal to)		1.16
Ammonia		1.41

(Signed) J. C. NESBIT."

Delivered free at a Wharf or Railway Station in London at 6*l.* per ton.—Apply to E. Y. JOLLIFFE, 70, Mark Lane, or the Works, Lavender Dock Wharf, Rotherhithe.

Agents wanted in all the principal towns.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.

From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

TO LANDOWNERS, SOLICITORS, ESTATE AGENTS, ETC.

THE LANDS IMPROVEMENT COMPANY, incorporated by special Act of Parliament, 1853, having perfected their organisation, are prepared to receive applications for the execution of improvements, under the provisions of their Act.

The Act extends to England, Wales, and Scotland; and empowers persons in the actual possession of lands, or in receipt of the rents, such as tenants for life, trustees, bodies corporate, incumbents of benefices, mortgagees in possession, guardians of infants, &c., to effect substantial improvements on their estates, and to convert the outlay on such improvements into a terminable annuity or rent-charge of from 14 to 25 years, at will.

The Company, acting under the supervision of the Inclosure Commissioners, will undertake and execute improvements, or will supply the capital to landowners preferring to execute improvements themselves, or will grant the powers of their Act to landowners seeking merely to charge the inheritance with the outlay on improvements from their own funds.

The Agricultural Works of Improvement particularly specified in the Company's Act, are:—

1. The Drainage of any Lands by any such means as the Inclosure Commissioners shall approve.
2. Irrigation, and Warping of Lands.
3. Embanking of Land from the Sea, or Tidal Waters, or Rivers, in a permanent manner.
4. Enclosing or Improving the Drains, Streams, or Watercourses of the Land, under the Inclosure Commissioners.
5. Reclamation of Land lying waste.
6. Making Farm-roads to the extent of one-half of the outlay for such roads.
7. Clearing Lands.
8. Erection of Farm-houses, and other Buildings required for farm purposes to the extent of three-fourths of the outlay for such Farm-houses and other Buildings.

In effecting the above Improvements there may be erected any Engines, Machinery, Engine-houses, Mills, Kilns, Sheds, Yards, Shafts, Tanks, and Reservoirs, Pipes, Conduits, and Watercourses for Irrigation, Tram-roads and other ways, Bridges, Weirs, Sluices, Flood-gates, and Hatches.

For Forms of Application and further Information apply to the Hon. W. NAPIER, Managing Director, 2, Old Palace Yard, Westminster, London.

PATENT ROOT GRATING MACHINE.

BUSHE & BARTER'S PATENT ROOT GRATING MACHINE, Manufactured and Sold by ALEX. SHANKS & SON, Arbroath, Forfarshire, from whom particulars, with prices, may be had.—Arbroath, Feb. 11.

HOSE PIPING.

TO ENGINEERS, AGRICULTURISTS, GARDENERS, SHIP-CHANDLERS, AND FIRE BRIGADES.

WAITHMAN'S PATENT FLAX TUBING (1-inch to 3-inch diameter) will sustain a greater pressure, is lighter, less bulky, will wear longer, and is about 60 per cent. cheaper than the leather hose pipe, and about half the price of either the gutta percha or the seamless hose. It is prepared so as to be anti-rot.

Manufactured only by WAITHMAN & Co., 36, High Street, Manchester.

TANNED GARDEN NETTING for protecting Fruit Trees from frost, blight, and birds, or as a fence for fowls, pigeons, Tulips, and seed beds, can be had in any quantity from JOHN KING FARLOW'S, Fishing Tackle and Net Manufactory, 4 and 5 Crooked Lane, London Bridge, at 1½*d.* per yard one yard, 3*d.* two yards, or 6*d.* four yards wide. Carriage free on all orders over 20*s.*, accompanied with a Post Office order, or London reference. Rabbit, Sheep, and Fishing Nets of every description in stock or made to order.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1*d.* per square yard; 200 yards, 14*s.*; 500 yards, 30*s.*; 1000 yards, 50*s.* Scrim Canvass, for Wall Fruit.—At EDGINGTON and Co.'s, 17, Smithfield Bars, City, and Old Kent Road, Southwark, where may be seen erected Emigrant Tents in great varieties, on their latest improved principles, and also at Brunswick Street, Poplar, near the East India Export Dock.

WIRE FENCING, 6¾*d.* per square yard, in various widths, from 6 feet to 15 inches, an effectual Fence against Hares, Rabbits, Cats, Dogs, Sheep, Deer, and for making Inclosures for Pheasants and Fowls; ditto 4-inch Mesh, 4*d.* per square yard. Numerous testimonials of a favourable character.—R. RICHARDSON, 21, Tonbridge Place, New Road, London.

WORSTED GARDEN NETS, 7*d.* per square yard, an effectual protection for the blossom from frost, blight, and afterwards from wasps. This article has been approved of by the Horticultural Society. All kinds of Garden Nets, Sheep Nets, and Fishing Nets made by machinery on low terms.—R. RICHARDSON, 21, Tonbridge Place, New Road, London.

FRUIT TREES, POULTRY, RABBIT, SHEEP, and CAT FENCING.—Worsted Netting to protect the Bloom of Peach, Nectarine, and other Trees, Flower, or Seed Beds, from Frost, Blight, and Birds, 2 yards wide, 5*d.* per yard. NEW TWINE NETTING (Tanned if required), 1 yard wide, 1½*d.* per yard; 2 yards wide, 3*d.* per yard; 4 yards wide, 6*d.* per yard; Half-inch Mesh ditto, 2 yards wide, 6*d.* per yard. TANNED NETTING, 2 or 3 yards wide, 1½*d.* per yard. ELASTIC HEXAGON GARDEN NET, or Scrim Canvas, 4½*d.* per square yard. COCOA NUT FIBRE, or Hemp Sheepfolding Net, of superior quality, 4 feet high, 4*d.* to 6*d.* per yard. Rabbit Net, 4 feet wide, 1½*d.* per yard; 6 feet wide, 2¼*d.* per yard; 8 feet wide, 3*d.* per yard. Each Edge Corded, ½*d.* per yard extra, suitable for Poultry Fencing. Square Mesh Cricketing Net, fix its full width and length, made of stout cord, 3*d.* to 4*d.* per square yard; this is the best article made for fencing, against fowls, cats, &c. Orders by post with post-office order or town reference, punctually attended to. The Trade supplied. Fishing Nets of all kinds in stock. Tents, Marquees, Rick Cloths, Tarpaulin, Lines, Rope, Twine, &c., at W. COLLINGFORD'S, 1, Edmund-terrace, Ball's Pond-road, Islington, London.

GALVANISED WIRE GAME NETTING.—7*d.* PER YARD, 2 FEET WIDE.

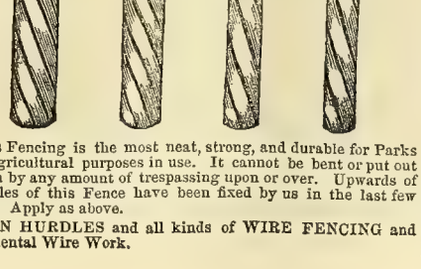
	Galvanised.	Japanned iron.
2-inch mesh, light, 24 inches wide ...	7*d.* per yd.	5*d.* per yd.
2-inch " strong " ...	9 "	6½ "
2-inch " extra strong " ...	12 "	9 "
1⅝-inch " light " ...	8 "	6 "
1⅝-inch " strong " ...	10 "	8 "
1⅝-inch " extra strong " ...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the prices one-fourth. Galvanised Sparrow-proof Netting for Pheasantries, 3*d.* per square foot. Patterns forwarded post free.

Manufactured by BARNARD & BISHOP, Market Place, Norwich; and delivered free of expense in London, Peterborough, Hull, or Newcastle.

H. J. MORTON AND CO., Galvanised Iron Roofing Works, 2, Basinghall Buildings, Leeds.

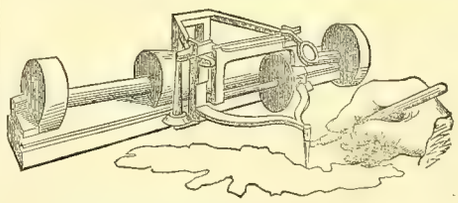
PATENT WIRE STRAND FENCING FOR PARKS, &c.



This Fencing is the most neat, strong, and durable for Parks and Agricultural purposes in use. It cannot be bent or put out of form by any amount of trespassing upon or over. Upwards of 700 miles of this Fence have been fixed by us in the last few years. Apply as above.

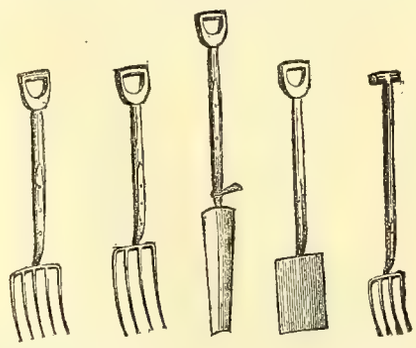
IRON HURDLES and all kinds of WIRE FENCING and Ornamental Wire Work.

TO SURVEYORS, ARCHITECTS, & ENGINEERS.



SANG'S PLATOMETERS; OR, SELF-ACTING CALCULATORS.—These Instruments tell accurately the contents of figures drawn on Maps. They effect a great saving of time and labour, as in order to find the area it is only necessary to lead a tracer round the outline of the figure, however irregular it may be. Price 10*l.* each. Sold by JOHN SANG, Kirkaldy; and by Messrs. ELLIOTT & SONS, 56, Strand, London.

TO AGRICULTURISTS, GARDENERS, ETC.



BENNETT AND NAYLOR, GENERAL IRONMONGERS, and FACTORS, Sole West End Agent for PARKES', late WINTON PARKES' CELEBRATED STEEL DIGGING FORKS and TOOLS. Also for the only efficient Stove, with or without a flue, suited particularly for Conservatories and Greenhouses, Patronised by her Majesty. Price 12*s.*, and upwards, at the Great Western General Ironmongery Warehouse, 255, Oxford Street, between Park Street and North Audley Street. Established for the sale of all descriptions of Ironmongery at Wholesale Prices. Sheet, Hoop, Rod, and Bolt Iron; Locksmiths and Bell-hangers. Patent Fuel, to be used with the Stove, 2*s.* 3*d.* per bushel.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS.

MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.

103, Newgate Street, and 52, Little Britain, London.

ANTHONY'S PATENT AMERICAN CHURN.—Extract from the Royal Agricultural Society's Report of the trial of Churns at the Gloucester meeting in July last. "In this trial the American Churn not only maintained its character in producing butter rapidly, but in producing a greater quantity from the like amount of cream." It made from 4 quarts of cream 4 lbs. 6 oz. of butter, being 8 oz. more than any of the other Churns from the same quantity and quality of cream. Price Lists of Churns and Implements by the best makers sent free, and Illustrated Catalogues on receipt of eight postage stamps. BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, London, who have always a large stock of Steam-engines, Ploughs, Harrows, Diggers, Waggons, Carts, Threshing and Dressing Machines, Mills, Oat and Grain Bruisers, Oilcake Breakers, Reaping Machines, Haymakers, Horse-rakers, Turnip Cutters, Liquid Manure Carts, Parkes' celebrated Steel Digging Forks and Draining Tools, Pumps for Manure, Farm Fire Engines, and for Garden Purposes, &c. &c.

IRON AND WOOD HOUSES FOR EMIGRANTS, and for various purposes in this country, from 10*l.* to 12*l.* each; also Portable Poultry Houses, Outhouses, Summer Houses for Gardens, large Aviaries, Pheasantries, &c., very cheap. Drawings of Poultry Houses sent free by post; also 21 Drawings of Iron and Wood Houses.—R. RICHARDSON, 21, Tonbridge Place, New Road, London.

THE LABORATORY of the ROYAL POLYTECHNIC INSTITUTION is always open for the reception of pupils, under the direction of J. H. Pepper, Esq., F.C.S. A.C.E., &c. Careful Analyses and Assays of Soils, Minerals, Waters, Mercantile or Agricultural Products, are performed with despatch, accuracy, and economy.

For terms apply to Mr. R. I. LONGBOTTOM, Secretary.

PRESENT PRICES OF AGRICULTURAL SEEDS.—*See* Messrs. SUTTON'S DESCRIPTIVE LIST, *on the last page of* GARDENERS' CHRONICLE *for January* 28.

The Agricultural Gazette.

SATURDAY, FEBRUARY 11, 1854.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

WEDNESDAY, Feb. 15—Agricultural Society of England.
THURSDAY, — 16—Agricultural Imp. Society of Ireland.
WEDNESDAY, — 22—Agricultural Society of England.
THURSDAY, — 23—Agricultural Imp. Society of Ireland.

WE read in the *Times* of Wednesday last that Mr. C. FARAQUET, a French engineer employed by the Peruvian Government, has reported the following quantities of guano as at present existing on the Chincha islands:—

On the northern island	4,189,477 tons.
" central island	2,505,948 "
" southern island	5,680.675 "
	12,876,100 "

which is said to correspond to 16,500,000 tons of saleable weight. On this, Mr. CAIRD remarks that sufficient exists for the requirements of the present

generation. He refers, too, to the present state of the guano market as a proof that no monopoly or agency, however well administered, can equal a perfectly free trade in the provision of supplies for our necessities.

The Report upon the Canadian census referred to last week is interesting to Englishmen in two respects: 1st, as an example of the uses of a good statistical account of the national agriculture; and, 2d, as containing a most instructive comparison of Canada and the States, which will be studied with advantage by intending agricultural emigrants. On this latter point we make the following extracts:—

"In the United States the growth of Wheat has increased about 48 per cent. during the last 10 years, whilst in all Canada, during the same period, it has increased upwards of 400 per cent.! And taking the article of Indian corn, which is the production that compares most favourably for the United States, the increase on it for the 10 years between 1840 and 1850, has been equal to 56 per cent., viz.: from 377⅓ millions of bushels to 592⅓ millions—(see page 60 of Mr. Kennedy's Report),—whilst the increase in Canada for the last nine years has been 163 per cent., the census having been taken in 1842 and not in 1841. During the same period also, the increase in the growth of Oats in the United States has been 17 per cent., whilst in Upper Canada it has been 133 per cent., in Lower Canada 41 per cent., and in both united 70 per cent."

And confining ourselves to the State of Ohio, which furnishes a better standard of comparison—

"The number of cultivated acres in Ohio is one-fourth greater than those of Canada, being 9,800,000 to 7,300,000, or rather more than 10 to 7, yet the bushels of Wheat are one-twelfth less, being in Ohio 14,487,000 to 16,202,272."

"Ohio, in cultivated acres, possesses $\frac{1}{12}$ of all the United States. In uncultivated acres, possesses $\frac{1}{22}$ of the same. She possesses one-fourth more cultivated land per inhabitant than Canada, having five acres to four. All Canada produces one-seventh more bushels of Wheat than Ohio, and 1½ bushel more per individual. Upper Canada, however, produces six bushels more Wheat per individual than Ohio—the latter producing in her staple Indian corn 29 times more than Canada, which produces 77 times more Peas, and 54 per cent. more Oats than Ohio. The land of Ohio is valued at nearly double that of the average of the Union (see the report of Mr. Kennedy, page 49), and has more than three times as many inhabitants to the square mile as the average of the Union—she having $49\frac{55}{100}$ and the average of the states being $15\frac{57}{100}$."

These statements indicate, then, the great activity, energy, and success of arable farming in the Canadas as compared with the State of Ohio. As regards the produce of pasture farming, the comparison is more favourable to the latter:—

"Canada possessed, in 1851, 46,939 more milch cows than Ohio, and yet Ohio produces one-third more butter, and nearly eight times as much cheese as Canada. This is a most important feature in the difference between the two countries—amounting annually to the large sum of 276,122*l.* for butter, and 376,703*l.* for cheese, in favour of Ohio, although Canada, possesses nearly 47,000 more cows. How to account for so great a difference, the prices being taken at the same rate in both countries, is a very difficult matter. The having a more congenial climate than Canada east, shorter winter, and the supply of green food continuing for a larger period, may account for a great deal, but certainly not for such a serious discrepancy. The natural inference is that the breed of cows in Canada must be very inferior to those of Ohio."

Then follows information on other deficiencies of the Canadian agriculture, and inferences drawn from it, which belong rather to the other division of our subject—the advantages of statistical information of the kind here given. The farmer is directed by means of it to those branches of his business in which these deficiencies are most apparent. We select the following from among the lessons which Mr. Hutton, the author of the report, has most satisfactorily drawn from the tabular statements of the census:—

"1. Canada should attend to the improvements of the breed of milch cows; the value of butter and cheese produced in Ohio from 47,000 fewer cows and calculated at the same price in both places, being about 70 per cent. more than in Canada. 2. Canada should make more cheese. Ohio produces 760 per cent. more than Canada, and 28 per cent. more butter. Canada depends too much on foreign countries for her supply of cheese, and the demand for American cheese in Canada causes its production in such large quantities in Ohio. At present cheese is much the more profitable of the dairy produce. The value of cheese in Ohio, at 5*d.* per lb., is 433,740*l.*, against 57,037*l.*, the value of cheese in Canada at the same price, making a difference in favour of Ohio of 376,703*l.* 3. Canada should grow more Clover seed and Grass seed, for which her climate is quite as well adapted as Ohio. Of these two articles, the latter grows 130 per cent. more than Canada, making a difference of 80,000*l.* against Canada, always bearing in mind that the cultivated land of Ohio is 33 per cent. more than that of Canada. The farmer should not be under the necessity of purchasing Clover seed—the very purchase makes him sparing, and a field of Wheat or Barley should not be sown without seeding it down with 10 or 12 lbs. of red Clover per acre. 4. Canada should keep more sheep—the value of sheep and wool being both 140 per cent. higher in Ohio than in Canada, though the quality of sheep and weight of fleece is rather better in the latter, and the cultivated land of Ohio only 33⅓ per cent. more than in Canada.

In value of sheep, Ohio exceeds Canada	... ...	£879,405
" wool, "	... ...	606,564
		£1,585,969

5. Canada should grow more Indian corn. Ohio produces 2800 per cent. more than Canada, although the difference in the climate in the Upper Province does not warrant anything like so great a difference. The average acreable value is not quite so great as that of Wheat—the average crop of Wheat, 16 bushels at 4*s.* is 3*l.* 4*s.*, and 24 bushels of Indian corn at 2*s.* 6*d.* is 3*l.*; but it should be remembered that Wheat occupies the land two years and Indian corn one, and requires more outlay for seed and labour than Indian corn; and an acre of corn stalks is more valuable than an acre of straw, and the condition of the land after corn is much better than after Wheat. 6. Canada should have fewer acres under Wheat as well as more under corn. There is too large a proportion of the land in Upper Canada under Wheat, nearly one-fifth of the whole cultivated land, say $\frac{4}{19}$. 7. Canada might grow more Tobacco. Ohio produces 850 per cent. more than Canada—and a large portion of Upper Canada is well calculated for its growth. In this article alone, Ohio has 230,000*l.* worth more than Canada."

Now here is trustworthy advice of the most valuable character founded upon information in reference to Canada—of which we, as regards our own country, are wholly destitute. We understand that it has been in the face of considerable opposition that a bureau of agriculture, as a department of the Canadian government, has been established. We are sure that if it shall continue to furnish information and instruction of the kind presented in this report on the census, the opposition which it will encounter in the future will be that of a rapidly diminishing minority. There is nothing of which the most jealous politician can complain—nothing in the least corresponding to mere class legislation—in the official collection and promulgation, at whatever expense, of information for the common good, on a branch of industry of such essential importance as agriculture. The value of such information to agriculturists would be but part of the good that would accrue; all branches of industry, and all classes of consumers—in fact, the people generally—suffer for lack of the knowledge which would thus be taught them.

NITRATE OF SODA A SUBSTITUTE FOR GUANO.

[Some remarks upon the paper by Philip Pusey, Esq., in the last number of the "Agricultural Journal," entitled "On the Natural Law by which Nitrate of Soda or Cubic Saltpetre acts as a Manure, and on its Substitution for Guano."]

As I am not a member of the Royal Agricultural Society, I take the liberty of requesting space in the *Agricultural Gazette* for some critical remarks upon the above paper. Mr. Pusey's paper is upon a subject of the greatest possible importance, and the natural law which he considers he has established affects the very foundation of chemical science, and would, if true, upset the views of all the vegetable physiologists of modern days. I will make no apology, then, for intruding my remarks once more upon the agricultural world.

Mr. Pusey ventures upon the following generalisation, which, in fact, is the law he attempts to establish. "We may now therefore assume, with unhesitating certainty, as a great law of nature, that substances strengthen vegetation mainly by their contents of nitrogen."

The experiments upon which Mr. Pusey attempts to found this law are given in detail. Suspecting that the nitric acid in the nitrate of soda was the true fertiliser when this substance was used as a manure, Mr. Pusey first instituted a comparative experiment, in which he used nitrate of soda in two strengths, and nitric acid in six. The results, taking 10 as perfection, gave 10 and 9 for the nitrate, and 8 for the four strongest applications of nitric acid, and 2 and 0 for the two weakest. Mr. Pusey then performed two other experiments, in which nitrate of soda, nitric acid, carbonates of ammonia, soda, and potash, were used. In Mr. Pusey's words: "In both trials the nitric acid acted decidedly. The alkalies neither of them produced even a trace of effect on the colour or the growth of the Grass. The success, therefore, of the experiment was complete." And Mr. Pusey considers the law as stated above to be established with "unhesitating certainty."

Mr. Pusey will, perhaps, feel surprised when he hears that in the experiments upon which he attempts to found a great natural law, that the conditions he assumes were never fulfilled, and that his plants of Grass never fed at all upon nitric acid. The fact is simply this. The moment nitric acid comes into contact with the soil upon which the Grass is growing, it ceases to exist as nitric acid at all. In the absence of all proof that plants can eliminate free nitric acid, it is certain, beyond all shadow of doubt, that free nitric acid cannot exist in a soil which is capable of growing Grass or corn!

The truth of this will be rendered clear by the slightest reflection. All fertile soils contain lime, soda, potash, magnesia, generally as carbonates—either individually or collectively—and the moment the nitric acid came in contact with the soil it would become a nitrate of one or other of three alkalies. Mr. Pusey's experiment then becomes involved into that of one nitrate against another. A little reflection will show that a strong acid like the nitric, if diluted as to 24 of water, which destroys the Grass, must also destroy the tender spongioles and roots, if it ever reached them. That it never did reach them is perfectly certain, even from the fact that the Grass grew after the leaves had died. But the evidence is much stronger than this, because either from the presence of alkalies or the existence of vegetable matter, nitric acid must, as a law, become decomposed the moment it comes into contact with a fertile soil.

But Mr. Pusey, in his second experiment, attempts to prove that the base of nitrate of soda is inoperative as a manure by the use of carbonate of soda. Surely Mr. Pusey must have known that carbonate of soda was a very different thing from the oxide of sodium or soda with which the nitric acid is combined to form nitrate of soda; and that a comparative experiment with the carbonate must be utterly worthless. Nitrate of soda is much more soluble than the carbonate; and this fact alone would lead to the inference that, if the plant required the alkaline base, it would select it from the same soluble salt.

I do not, however, deny that the plants may make use of the nitrogen in the nitrates, but at present it is quite certain that we have no proof of the fact, or that a plant can eliminate nitrogen from any other substance than ammonia.

But if the fact, which Mr. Pusey's experiments go so little way to prove, were true, that the nitrogen of the nitrates is the fertilising principle of these salts, how does this affect Mr. Pusey's natural law, that "substances strengthen vegetation mainly by their contents of nitrogen?"

I need not I am sure inform Mr. Pusey that nitrogen is not an ingredient at all of vegetable structure, but that it is deposited in their cells in the form of one or other of the proteine compounds, with the beautiful purposes of subserving to the formation of animal organism. It is quite clear then that nitrogen, while it may enrich, can never in any way strengthen vegetation. Nitrogen supplied to the plant may, according to Liebig, enable it to eliminate more carbon and hydrogen; but, as I ventured to argue 10 years ago in your pages, this can only be done to the amount required for the proteine compound. The proper structure of the plant must be developed from its own resources; if it requires an alkali, which all plants do, it seizes from the soil a soluble salt, a nitrate, which contains what it wants. Phosphorus, sulphur, lime, silica, all equally wanted, it obtains from the same source in a soluble form. Nitrate of lime and magnesia are very soluble, and therefore both are readily accepted by the plant, but only to the proportional amount required to form the compound bodies into which they enter.

I wish all agricultural chemists would bear this important fact in mind, that vegetables only require their constituent ingredients in definite proportions. One experimentalist covers his land with nitrate of soda and he gets an excellent crop. The plant takes as much as it requires, and is thus enabled to eliminate more of its other constituents from the soil, and it grows and produces largely. The delighted farmer goes on year after year until some important ingredient, say phosphorus or sulphur, is used out, and then his crop does not grow at all. He throws away his nitrate of soda in disgust; believes his previous crops were good ones from some fortuitous circumstance, disbelieves in agricultural chemistry, and forthwith speaks against it at public dinners and farmers' clubs. What is good of nitrate of soda is equally applicable to other manures, which, on the same ground, obtain a temporary fame. Guano is a compound manure. It has ingredients to strengthen the plant and to enrich it with proteine compounds; but I venture in all humility to predict that nitrate of soda, although it will always be a useful manure, will never supersede guano or (what I have heretofore endeavoured to show would prove its substitute*) urine. I have thus briefly, and I am sure Mr. Pusey will allow in the best possible spirit, endeavoured to point out that the natural law he has thought proven does not in reality exist. That his plants never did take up free nitric acid—that the effect produced was that of a nitrate or nitrates—that he has not added by his experiments to anything already known as to the elimination of nitrogen by plants, and that as they are nourished and enriched by elements analogous to those contained in their own structure in definite proportions, therefore no one ingredient can mainly contribute to this effect, and consequently that Mr. Pusey's induction is not sound.

Management of Manure: Blackie's Cyclopedia.—I have read Dr. Voelcker's reply to some observations of mine in the *Gazette*, on some portion of the article Manure in the "Cyclopedia of Agriculture," which appeared to me to require elucidation. The writer having stated that 100 cwt. of fresh farm manure contained 40 lbs. of nitrogen, which nitrogen was dissipated in the shape of ammonia in certain portions during the progress of decomposition, I was under the impression

he had, in those portions, disposed of the whole quantity. I see, however, by the first part of Dr. Voelcker's reply, that 35 lbs. only were so disposed of instead of 40 lbs. The correction therefore amounts to this: that as respects a given weight of fresh manure, seven-eighths of the nitrogen is lost in the progress of it to perfect decomposition. Accuracy in such matters is important; I am therefore obliged by this correction; but, for the purpose of the question under consideration, viz., what is the most economical mode of dealing with our farm manure?—whether the loss by decomposition be 35 lbs. or 40 lbs. in the 100 cwt. is of small moment. Dr. Voelcker's further effort to elucidate the subject of my observations is unsuccessful to my apprehension. He proceeds, "But on reading carefully the whole experiment mentioned in page 343 of the 'Cyclopedia,' it will be found that the manure produced in the first period of fermentation, as well as that obtained in the second and third, is richer in nitrogen than the original fresh manure; for he will find it stated that 100 cwt. of fresh manure, containing 20 lbs. of nitrogen (this is no doubt an error of the press for 40 lbs.), were reduced to 80 cwt., when allowed to ferment until the straw became half rotten, during which period 5 lbs. of nitrogen were lost. The remaining 80 cwt. will thus contain 35 lbs. of nitrogen. Further, the 100 cwt. of common manure when fermented until fat and cheesy, will be reduced to 60 cwt., during which second period of fermentation 10 lbs. of nitrogen were dissipated in the form of ammonia. The 60 cwt. of manure thus produced will consequently contain 30 lbs. of nitrogen; and lastly, that 100 cwt. of manure fermented until perfectly decomposed will be reduced to 40 or 50 cwt., and lost in this third period of fermentation 20 lbs. of nitrogen. The 40 cwt. of perfectly decomposed manure did thus retain 20 lbs. of nitrogen." I should not presume to call in question any purely chemical statement made by so skilful a chemist as Dr. Voelcker; but as he has put it, this really appears to me a mere question of arithmetic, which in figures stands thus:

100 cwt. of fresh manure contains of nitrogen ...	40 lbs.
1st stage of decomposition reduces to 80 cwt., at a loss of nitrogen of	5 "
Remain	35 lbs.
2d stage of decomposition reduces to 60 cwt., at a loss of nitrogen of	10 lbs.
Remain	25 lbs.
3d stage of decomposition reduces to 40 cwt., at a loss of nitrogen of	20 lbs.
Remain	5 lbs.

After the weight of 100 cwt. has been reduced to 60 cwt., at a loss in the two first stages of decomposition of 15 lbs., and after the further reduction of weight in the third stage to 40 cwt., at a loss of 20 lbs. more of nitrogen, how the 60 cwt. can contain 30 lbs. of nitrogen, and the 40 cwt. retain 20 lbs. of nitrogen, I do not comprehend; and "that the manure produced in the first period of fermentation as well as that obtained in the 2d and 3d are richer in nitrogen than the original fresh manure," which, on the same authority, contained 40 lbs., and has lost 35 lbs. in the progress of decomposition, will, I fear, perplex more farmers' brains than mine. *C. L., Cirencester, Feb.* 6.

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

At the Monthly Council held last week, Lord Berners and J. Rogerson, Esq., Highgate Rise, Middlesex, were elected Governors.

The following new members were elected.

Darell, Rev. Sir Lionel, Bart., Trethorne Rectory, Gloucestersh.
Ridley, Nicholas James, Hollington House, Newbury, Berks.
Fraser, John, Llantarnane, Newport, Monmouthshire
Jones, Charles Gwillim, 25, Craven Hill, Hyde Park
Rhind, Josiah, Wick, Caithness, Scotland
Hubbard, Wm. Egerton, 24, Kensington Palace Gardens
Tichborne, Sir James F. Doughty, Bt., Tichborne Pk., Alresford
Brewer, Jehoida, Newport, Monmouthshire
Smith, Edward, Ratcliffe-on-Trent, Nottinghamshire
Pitcairn, Alexander, Ardmaddy Castle, Oban, Argyleshire
Stokes, Thomas, Chivers Hall, Ongar, Essex
Milford, Thomas, Thorverton, Exeter
Wortley, Edward, Ridlington, Uppingham, Rutlandshire
Dupuis, Rev. Geo. John, Creeting Rectory, Needham-Market
Burgess, Capt. H. W., Fitzroy Park, Highgate, Middlesex
Tidmarsh, Charles, Kemerton, Tewkesbury, Gloucestershire
Mildmay, P. H. St. John, Hazlegrove House, Castle-Carey, Som.
Wood, George, Howrigg, Carlisle
Knatchbull, Rev. H., Elmham Vicarage, Norfolk
Ward, John, Chadlington, Eynsham, Oxfordshire
Ellis, J., Newton St. Cyr, Exeter
Bridge, Thomas, Wynford-Eagle, Dorchester, Dorset
Berry, Kemp, Woodgate, Beckley, Sussex
Neems, Timothy, Frocester, Stroud, Gloucestershire
Thompson, George, 30, Parliament Street, London
Grsswell, Dan, Louth, Lincolnshire
Bright, Henry S., Hull
Strelley, R. S., Oakerthorpe, Alfreton, Derbyshire

For a list of the proceedings of the Council on this occasion, see our last week's Paper.

A Weekly Council was held at the Society's House in Hanover Square, on Wednesday, the 8th of February, Mr. Raymond Barker, V.P., in the chair.

Veterinary Inspection.—The following report from Prof. Simonds, the Veterinary Inspector of the Society, on an official visit paid by him to a portion of the live stock of his Grace the Duke of Richmond, at Goodwood, by direction of the Veterinary Committee of the Society, was received from the monthly council and read at this weekly meeting.

I have to report that in accordance with the instructions of the chairman of the Veterinary Committee, I proceeded on the 30th ult. to Goodwood, the seat of his Grace the Duke of Richmond, to investigate a disease existing among some oxen belonging to his Grace. It appears that the animals in question had been purchased, with some others, since destroyed by the disease, on the 4th September last, at Barnet Fair. At the time of purchase, as also when they arrived at Goodwood four days subsequently, they seemed to be in perfect health. The original lot consisted of 40 bullocks of the Highland breed, varying in age from two to three years; at the time, however, of my visit their number was reduced to 24, by the fatality of the malady. Although there is no direct evidence to prove that the animals were diseased when bought, I have little doubt that such was the case; first, from the chronic nature of the affection; secondly, from the non-existence of any similar disease in the neighbourhood; thirdly, from the non-application of the ordinary exciting causes of such a malady after purchase; and fourthly, from the early occurrence of illness among the animals after arriving at Goodwood. The fatality of the disease, as well as the symptoms presented by the animals, led to the belief, prior to my visit, that they were the subjects of pleuro-pneumonia. By a careful examination, however, I satisfied myself that the affection, although centered in the lungs, was not of the precise nature of the one commonly known as pleuro-pneumonia. From the answers returned to the Society's list of questions, it appears that 16 of the animals had died between the middle of September and the end of December, and that seven others were then ill, the remaining 17 being reported as free from the malady. In inspecting these 17 animals, I discovered that two more had contracted the disease; these I caused to be immediately removed, that they might be placed with the infected and forthwith subjected to medical treatment. To a non-medical observer, these two bullocks gave no evidence of the malady; one of them, however, has since died, and a portion of its lungs, extensively diseased, was forwarded to me at the College a few days since. The emaciated condition of the diseased animals, the nature of their malady, and the length of their illness, afforded but little hope of the speedy cessation of the fatality by the adoption of the best remedial measures. This opinion was expressed to his Grace, and it has since received confirmation by the death of two more of the animals. It is also more than probable that other deaths will yet take place; but still I feel assured that by the measures which are advised, a limit will soon be put to the extension of the disease, and that several lives will be saved which otherwise would have been sacrificed. As is often the case, an immediate good effect appeared to attend upon a change of treatment and management, for at the end of a week from my visit, I received a report from his Grace's bailiff, in which he says, "I am happy to state that the bullocks are going on favourably. They were altered as to feeding and management according to your directions, and from their improved appearance I am in hopes that they will now do well without much further loss." In the former part of this report I have observed that the malady showed itself very soon after purchase; to this has to be added that its progress has not been uniform, and that the deaths have taken place at irregular intervals. Fortunately, from the first, isolation of the diseased was strictly enjoined, so that none of his Grace's other cattle have sustained any injury. Had such a plan not been adopted it is greatly to be feared that the losses, heavy as they now are, would have been much augmented, as most of the affections of the respiratory organs of cattle are contagious in some stage or other of their progress. Removal of the sick and isolation are therefore of the first importance to limit the extension of many maladies affecting cattle. The progress of the disease, and also some of the more prominent lesions it produces in the lungs and chest will be gathered from the following statement of Mr. Arras, the bailiff:—"The first case," he says, "of the disease took place ten days after the bullocks reached Goodwood. The animal lingered eight days, when it died. On opening it, the chest contained a large quantity of water, and a thickish mass surrounded the lungs. The second case occurred six days after the first. It was more rapid in its progress, the animal dying in five or six days. One lung was enlarged and gorged with blood, the other was only slightly affected. Two more cases happened after an interval of ten more days. These bullocks are still living, but are reduced to mere skeletons. The next two animals both died. The right lung of each was chiefly diseased. In one of these bullocks the lung was hard and of a slate colour in patches; in the other it was also hard and discoloured, besides containing several tumours filled with matter. The other cases had much the same general character. In one animal the throat and also the air passages were much inflamed, and although the disease did not seem to have affected the lungs, the chest was found to be filled with water." With reference to the most recent death, and which occurred on the 26th inst., Mr. Arras writes, "Another of the bullocks was found dead this morning. It is one of the two which you took from the supposed healthy, when you were at Goodwood. The man who opened it says, that the lungs were firmly grown to the ribs, and that nearly three gallons of water came out of the chest. I have given directions for part of the lung to be sent to you." From these statements, it is very evident that the disease has varied somewhat in the nature of the lesions it has produced in the lungs. In several of the cases it has destroyed the animal by copious effusions of serum into the cavity of the chest, but in others the substance of the lung has been principally diseased. In the specimen received at the College, the lung tissue was destroyed in patches from chronic inflammation, while the pleural surface of the organ was covered with effused lymph, the result of recent and acute inflammation of the pleura. The extension of the inflammatory action from the substance to the surface of the lung is sure to produce effusion, and when large quantities of serum are suddenly thrown out, then death will result and almost immediately from asphyxia. This explains the somewhat unexpected death of the last animal, and it constitutes the main danger which attends upon those now diseased. The prevention of the effusions by combatting the pre-existing disease of the lungs is, therefore, one of the leading principles of the treatment which is being adopted. At the commencement of the malady the animals had not the care of a veterinary surgeon, but of late they have been attended by Mr. Dawtry, of Chichester. On the occasion of my visit I saw Mr. Dawtry, and explained to him the opinion I had formed of the nature of the disease and the principles which should guide him in effecting its cure. I also gave instructions for the management of the animals which seemingly were not diseased, with a view to their preservation. These instructions, slightly modified by circumstances which have since arisen, have been fully carried out, and the results, up to this time, are as favourable as could have been anticipated, when the duration of the malady and the importance of a healthy state of the organs in which it is located are taken into consideration.

Jas. B. Simonds,
January 30th. Veterinary Inspector.

In reply to the inquiries of Mr. Fisher Hobbs, Mr. Pocock, and Mr. Woodward, Prof. Simonds stated that he considered that the whole of these animals would have died, had not the change of treatment he recommended been adopted. They were not affected with the disease commonly known as pleuro-pneumonia, but with that common inflammation of the substance of the lungs which so often results in the case of animals contaminated at the time of purchase, which are subsequently injured by over-exertion and exposure. The symptoms were loss of appetite, staring coat, coughing, discharge of mucous matter from the nostrils, difficult respiration, effusion of water in the chest ensuing in about eight days. The treatment he had adopted consisted in the administration of saline aperients, followed by diffusible stimulants, aided by tonic medicines, nutritious food, and well-ventilated sheds. In answer to a distinct inquiry by Mr. Fisher Hobbs, Professor Simonds added, that under similar circumstances, the same treatment might in general be adopted with the probability of similar beneficial results.

Inoculation for Pleuro-pneumonia.—The Secretary informed the Council that he had received a communication from Turin on inoculation for pleuro-pneumonia, from Dr. Reviglio of that city. Dr. Reviglio's results are given as fully condemnatory of the inoculation proposed by Dr. Willems, of Hasseth.

Oil-Cake.—Professor Simonds took that opportunity of submitting to the Council a specimen of oil-cake, that had been sold as food for cattle, but which had produced on the animals that had partaken of it in sufficient quantity all the effects of a virulent and rapid poison. Prof. Simonds laid before the Council communications on this subject made to him by Mr. Charles Sayles, veterinary surgeon, Tickhill, near Rotherham.

Professor Simonds stated that he had made experiments, at the Royal Veterinary College, on the effects of this mustard-cake on two sheep. He had mixed it with chaff and corn, and presented it to them, but that it was evidently distasteful to them, and they only eat from a quarter to half a pound daily, without producing any decided effect; while oxen had partaken of four or five pounds a day of it, and died in consequence. The local term "drapes" was intended to signify "barren cows."—Mr. Fisher Hobbs thought that the thanks of the Society were due to Professor Simonds for the trouble he had taken on the subject, especially as other oil-cakes, especially adapted for feeding purposes, were now adulterated in a high degree, particularly those of home manufacture, while the foreign cake at present maintained its average good quality. It was not long ago that Mr. Hobbs had known eight or ten beasts poisoned by eating cake adulterated with refuse bitter almond cake, and which was consequently impregnated to a certain amount with the prussic acid that kernel is known to contain. He thought he might make the general remark that "cheap" articles, recommended solely as such, were but too often the dearest the farmer could purchase, the quality of such articles being frequently reduced in a greater proportion than the price. He hoped our English cake makers would take warning in time, and not drive the English farmer to seek his best and most economical cake in the foreign markets.—Mr. Woodward fully concurred with Mr. Hobbs in the superior value of the foreign oil-cake: he would also add, that in the case of manures the cheapest were not by any means always the best.—Mr. Caird suggested that the south-country farmers of Great Britain should adopt the same means of safeguard against adulteration in oil-cake as had been so constantly used by the farmers of the north. In Scotland no farmer ever thought of making a purchase of oil-cake, any more than he would of manure, until he had been furnished with a properly certified analysis of its quality. In consequence of this simple and obvious precaution, no such thing was ever heard of among the northern farmers as adulterated oil-cake, as no unprincipled vendor had the slightest chance of sale for deteriorated compounds. He hoped the farmers of the southern part of Great Britain would lose no time in adopting a similar efficacious mode of security.

Elastic Steel Digging-forks.—Messrs. Burgess and Key, of Newgate Street, having obtained the entire agency of the well-known "Winton-Parkes'" steel digging-forks, manufactured by Mr. Francis Parkes, of Birmingham, transmitted a complete set of these forks to the Society, with the following account of their mode of manufacture:—

December 5, 1853.

Agreeable to your request, I proceed to describe to you the origin of steel forks for digging, manure, and other purposes, and the advantages to the consumer which they possess over every other implement of the kind. I have for many years been tool maker for the majority of the London market gardeners; my first effort to serve them was by improving their spades and hoes; the improvement in the spades consisted of plating the front side, or upper surface of the spade with cast steel, so as to impart to the implement the property of wearing itself to a knife edge, and to a peculiarly bright surface, which scarcely any soil would adhere to; my next effort to improve this article was to shape the iron and steel so as to produce a solid plate or blade gradually increasing in strength from the edge to the centre, and again wedge-like from the edge to the top or shank, which places the weight of the implement so near the hand that although it possesses great weight and force in its downward blow to cut through roots or turf, it does not rise or lift heavily, and there is also a novelty in the mode of joining the wood and iron part of the handle (as you will see by the one which is now exhibited, No. 1) instead of the iron covering the wood, as in the usual mode of construction, the wood covers the iron, and wood being a non-conductor of heat, comparatively with iron, the implement is much pleasanter to handle during the cold of winter; my next attempt was to improve the three-prong dung fork, then in use, having made some to pattern supplied by Messrs. Fitch, of Fulham, good in shape, but the prongs formed of ⅝ round iron tapered a little, and pointed, I was dissatisfied with them as being cumbrous and heavy. I then conceived the idea of making one of steel, sufficiently light and well tempered to be elastic; but being aware that the prong of a fork would be tested far more severely than sword-blade, bayonet, rapier, or anything of the kind, I determined upon selecting a good quality of cast steel, and tempering it as skilfully as my many years of experience would enable me to do, and to make the prongs of such a shape that the end section should be an oblong square, as shown by No. 2, now exhibited, thus offering the greatest resisting power to the strain occasioned by lifting a weight of dung or litter, and giving the more flexible elasticity in the direction that the fork was likely to become wedged or expanded, and was eminently successful, so much so, that Mr. W. Fitch subsequently told me that his man had then a fork in use which he had taken to London with the dung-cart every day for two years, and that it had never cost him one penny in repairs, in contra-distinction to the iron forks, which, when in regular use, cost 3*d.* every fortnight at the blacksmith's shop for pointing; and to use the man's own expression, it was at that time the best fork that ever was stuck into a pit of dung. I next saw the desirability of making a 4-prong fork for decomposed dung, compost, short litter, and various other purposes; here arose the difficulty: I had been

substituting a fork made from 1½ lb. of steel for one made of 3¾ lbs. of iron, and to make this good enough to stand its work at such a weight, I had seen the necessity of making the fork from one piece of steel without incurring the risk and uncertainty of welding or joining prongs together, when this difficulty was overcome, and we were able to forge any number of prongs from one piece of steel; subsequent experience has proved that forks of any given number of prongs (as the nature of the land may require) are the most efficient digging instruments, and the most durable; steel being a material susceptible of crystallisation, it necessarily becomes pre-eminently durable by crystallisation, and such durability is impaired to a very trifling extent only by the subsequent tempering which imparts elasticity. The elasticity of the fork proves to be singularly advantageous to the operation upon the soil—where the hardness or adhesiveness of the soil, or the intersection of roots offer more than ordinary resistance, and more pressure has to be applied, as soon as the release takes place the prongs spring forward with sufficient force to disseminate the soil in thousands of particles, or when the workman strikes a clod with the forks in an oblique direction, the prongs possessing all the vibrating powers as seen in the tuning-fork, will disseminate the soil into the minutest particles.

(Signed) "Francis Parker."

The Council ordered their thanks to Messrs. Burgess and Key for this present and communication.

Permanent Grasses.—Dr. Calvert suggested to the Council the offering of a prize "For the best plot of swarth land, the produce of seeds sown in the spring of 1855; the premium to be awarded in 1860 or 1861: the actual outlay incurred for manures, dressings, &c., as well as quantity and quality of produce, to be taken into account as far as practicable."—Mr. Fisher Hobbs objected to the form of challenge in which Dr. Calvert had put his proposal; at the same time, that he thought the subject of the best Grass-seed known in England as one of the most important that could engage the attention of the Society.—Mr. Pocock suggested that in the mean time Dr. Calvert would render a great service to the Society by putting in the form of a report a detailed statement of his experience on this important subject. Dr. Calvert replied, that he should be happy to do so, should time be allowed him for the completion of such an undertaking.

Guano Deposits.—The Secretary informed the Council that at their next monthly meeting he should have the pleasure of reporting the communication in which he was then placed with Sir James Graham, in his capacity of First Lord of the Admiralty, in reference to active measures taken by him as the head of that department, for the discovery of new sources of guano by the officers of her Majesty's ships cruising on coasts within the rainless regions of the tropics. The chairman remarked that the society had reason to congratulate itself on the fortunate circumstance, that the distinguished individual who now presided over the naval department of the Government, was not only an excellent farmer himself, but also an office-bearer in the Society's Council, and one of its most active founders and promoters.—Mr. Caird thought that for the last few years the influence of our government had not been sufficiently strong on the Peruvian authorities, as it appeared that while the guano-market in this country was nominally closed, in the United States it was not only open in full vigour, but the subject of successful negotiation of the American Government on the guano supply to that country had been made a point of distinct congratulation by the President, in his Message to the Congress. He therefore hoped that our Government also would not hesitate to consider this question as one of vital importance to the agricultural and shipping interests of the United Kingdom. Mr. Caird concluded his remarks by reading the following passage from the Baltimore Price-Current of the 7th of last month:—

There have been imported into the United States, during the year 1853, in 107 vessels, 70,530 tons of Peruvian guano; of which 50 vessels have arrived at Baltimore, and 57 vessels at other ports.

Imports of Peruvian Guanô at Baltimore for the last Five Years:—

1849	2,700 tons.
1850	6,800 „
1851	25,000 „
1852	25,500 „
1853	32,152 „

The Chairman was surprised to hear that America should have gained these important advantages denied to this country: he hoped, however, that such measures would soon be taken as would secure them also to our own farmers as well as to those in the United States, feeling assured that the Government of this country was fully alive to the importance of the question in all its bearings.—Mr. Fisher Hobbs was glad to find that there was no fear of an immediate failure in the supply of that valuable manure. He hoped the monopoly which had so long injuriously fettered the guano-supply to this country would at once be broken through, and that ere long we should receive them in the way of ordinary importation, and on a friendly footing, through our friends in the United States of America.

Substitutes for Guano.—At the suggestion of Mr. Bullen and Mr. Caird, the Council arranged that the subject of Fish-refuse and other substances, as substitutes for guano, should be taken into consideration on that day fortnight, Wednesday the 22d of February, at 12 o'clock.

Potato Cultivation.—A communication was received from Viscount Palmerston, along with a box containing fine samples of Potatoes, the produce of Mr. Franzi, a Tuscan gentleman, who attributes the success of his cultivation to his having dried the sets in autumn and retained them dry during the winter. The crop produced from these dried cuttings was abundant and sound, while the crop from common cuttings soon gave signs of decay.

The Council then adjourned to Wednesday next, the 15th of February.

Farmers' Clubs.

London, Feb. 6.—The Corn Averages.—W. Fisher Hobbs, Esq., in the Chair. The Chairman felt that his station was one of great responsibility. He had had the honour of presiding at these meetings on two former occasions, but he felt, now that they had united with the local farmers' clubs, his duties and those of the committee would be greatly increased. He hoped the Club would now become the central rallying point of the agriculturists of the kingdom, and that they would be able to carry such measures as would be beneficial to the agricultural interest at large. No exertion should be spared to render this the central farmers' club of England.—Mr. W. Pain, of Compton, Winchester, rose to read his paper on the subject for the evening. He observed that the imperfect mode in which the corn averages are taken had long been a subject of complaint with agriculturists throughout the country. It would not be necessary to go back to the origin of taking the corn averages, or the purpose for which they were collected, he should simply point out the way in which they are taken at the present time. The act which regulates them is the 5th and 6th Vic., and is intituled an act to, &c. Its chief purpose was to regulate the price of home-grown corn. The schedule contains the 290 cities and towns in England and Wales, from which the returns are to be made to certain inspectors. These inspectors are appointed in the city of London, by the Lord Mayor, and in the city of Oxford and town of Cambridge, by the officers, masters, and scholars of the Universities; in the other towns the officers of excise are to act as corn inspectors, except where the inspectors appointed by the 9th of George IV. are still holding office. In the City of London, or within five miles of the Royal Exchange, not only all corn dealers, but every person who shall sell any corn in Mark Lane, is required to make a declaration before the Lord Mayor before any sale that the returns made by him shall contain the whole quantity and prices of the corn, to be sold by or for him, with the name of the seller; and every person who in any of the other 290 cities and towns shall bring British corn to sell again, and many other persons as well, are required to make a similar declaration. These returns are to be made by the above parties on the first market-day in every week, and the inspectors are to enter the returns in a book, and transmit to the controller weekly an account of the quantity and prices of corn sold. The inspectors are forbidden to include in such returns any accounts furnished by any person who has not made the necessary declaration. The controller is to add together the total quantities of corn sold during the week in the different towns, and also the total prices for which the same shall appear to have been sold, and divide the amount of such prices by the quantities; the product of six weeks is then to be added together, and divided by six, and the result is deemed the weekly average which is to be published in the *Gazette*. The inspectors are also to affix a copy of the last returns on the market place, on each market-day. All corn dealers in the different markets alluded to are liable to a fine of 20*l.* for each and every month they neglect to make the declaration, and also a further fine of 20*l.* for neglecting to make a return; and any person making a false return is deemed guilty of a misdemeanor. These provisions, observed Mr. Pain, might answer if they were carried into effect, which is not the case. Hundreds never make any return at all, or do it improperly. But when it is considered that these returns are the basis on which corn rents and tithe rents are charged, the evil results of this neglect must be apparent. The present system wants a thorough revision. In support of his argument he would assert that in the market he attended, not one-third of the corn sold was ever returned. On some days only Wheat was returned, although Barley and Oats were sold in large quantities. He read an extract from a local paper corroborating his statements as to the negligence and laxity existing, and suggested that the evil might be in some measure remedied by making the returns imperative on both buyers and sellers, that one might be a check to the other. He thought also that the tithe rent charge of each county should be based upon the average for that county alone. He would appoint the excise or inland revenue officers to collect the returns; compel every grower to make a return of all corn sold or consumed; impose a penalty for refusal, and give half the fine to the informer; and, finally, no person should be allowed to make a return on a second sale. Although not quite in accordance with their general practice, he should submit to them a resolution embodying the views he had expressed. The following is the resolution:—"That it is the opinion of the members of this club that the present mode of taking the corn averages is imperfect in its operation, and injurious to the interests of agriculture; and that weekly returns should be made by the grower of all corn sold by him, verified by the signature of the buyer; such returns to be taken by the officers of excise or inland revenue." He now left the matter in the hands of the meeting, hoping the discussion would go on with spirit, and that they should be able to lay their grievances before the Government in such a manner as to get them rectified.

Mr. Pile, of Winchester, observed that the subject in debate was one in which the farmers had long felt a deep interest. It had been twice discussed in the Winchester club; in fact, the very first discussion they ever held was upon it. This was in 1850. Very recently the subject had been discussed again. He would read the resolutions arrived at on that occasion. 1. That in the opinion of this meeting the present mode of taking the corn averages is imperfect, and most injurious to the farmer. 2. That as at present, the returns are only made on the best qualities of corn, the average price which rules the tithe and rent-charge is calculated on false data. 3. That in the opinion of this meeting the returns should be made compulsory on the grower backed by the signature of the buyer, and that the returns should be collected in every market town in England and Wales by excise. 4. That a correspondence be entered into with the London Farmers' Club and other local clubs with a view of sending a deputation to the Board of Trade on the subject. This was evidence that the farmers had long considered they were labouring under a disadvantage in having to pay a higher rent-charge than they were justified in doing. He believes no tithe-receiver would object to receive his tithes upon the terms of a fair average price of the whole crop of their own growth. He contended that they ought not to be charged with the profits of trade, neither had they anything to do with the profits on foreign produce. The returns ought to be confined to the first sale, both buyer and seller should be compelled to make them, all the corn grown in the country should be returned, and regulate the averages for all purposes. The means by which he proposed to accomplish this, were, for every farmer in the kingdom to make a return monthly of all corn sold by him at market or consumed at home, to the clerk of the board of guardians in his respective union, the buyers to make a similar return; the returns to be made sealed to the clerk of the board of guardians, and by him to be transmitted to the Board of Trade. He justified the plan proposed on the ground of its simplicity and inexpensiveness, upon which he laid considerable stress, because he had had experience enough to know, if they suggested an expensive mode of taking the returns, who would have to bear that expense. After mentioning some instances of the carelessness with which the returns are made at present, he observed that the farmers do not wish to act unfairly toward the tithe-receiver—they only want equity; but in justice to themselves and their families, they should endeavour not to pay more than a fair and equitable average would warrant.—Mr. Baker, after some remarks on the Tithe Commutation Act, and its bearing on the present question, proceeded to show that the mode of taking the averages prescribed by the act of 1842 was intended to be confined to British corn, which it could not be if every buyer in Mark Lane, whether of foreign corn or not, were allowed to make a return of the corn purchased by him as British corn, without any investigation.—Mr. Baker dilated at some length upon the falsification of returns by dealers for their own purposes, and concluded his instructive address by observing that farmers feel it an injustice that they, who are the growers of corn, have no participation in making the returns of what they sell, but that those returns are made by parties who may be induced so to affect them as to impose injury upon them. It is to alter this that we are met, not to oppose any other interest, but to place ourselves as citizens in such a position as to secure that we shall be fairly dealt with on all occasions. The question should be taken up by this club; we should show that we are not asking anything unjust, anything unfair to other parties, but only what is fair and just to ourselves; that if the act was made to ascertain the average price of British corn, the best means of doing so should be adopted. He felt there was an object to be attained, which was an advantage, and not only an advantage but an act of justice to the agricultural interest. He had much pleasure in seconding the resolution.—Mr. Grainger agreed with Mr. Baker that returns should be made by the grower as well as the buyer, that these returns should finish the matter, that corn should never be twice returned. But the practice is to return it frequently twice, thrice, and even four and six times. It is often returned three or four times when it has not been moved. He had to complain of another evil in his own locality. They were in the habit of selling corn by weight, and frequently sold it as weighing a pound or two to the bushel more than it did weigh. (A laugh.) That was one of the greatest evils he knew. He alluded also to the injury sustained by the seller in the valuation of crops before harvest, when the averages are fictitiously made up. He considered that no evil affecting agriculture was so great as the present system of taking the averages, and cordially supported the resolution.—Mr. Lear, of Arundel, observed, as another proof of the interest taken in the subject, that it had been lately discussed in the club which he represented, and which had come to the resolution that the present system is a very unfair one, and the conclusions arrived at are obtained in a very unfair and partial manner.—Another speaker observed that the question became every day of more importance, because, although the tithe-rent charge may be considered as settled, still if we are going on an unsound principle as it respected corn rents, it is becoming every day a greater evil. This speaker mentioned some facts which had come under his own knowledge, showing how buyers evade making the required returns; and particularly an instance in which two samples of Wheat, of 1847 and 1848, and therefore of course differing much in quality and price, were purchased together. He was anxious to see what return, if any, was made. He found the best returned, the inferior left out. The reason was plain. A miller who professed only to make the best flour would not return himself as having purchased a sample of very indifferent Wheat. It was more difficult to show how the manner of taking the averages might be improved. He would not extend the area of the returns, but thought it better that they should be confined to pitched markets, because at these there would always be a clerk to take the returns, and furnish the necessary forms to buyers and sellers; this would do away with the difficulty which many farmers would feel about making a return of the corn sold or consumed at home, which, it might be contended, was a return of the produce of their farm. He could not agree with the suggestion that the returns should be made through the boards of guardians—he thought there would then be more fraud than at present, and, though apparently inexpensive, the plan would, in the end, be more expensive.—Mr. Coote, of Brighton, showed the importance of the subject from the fact that there are now more farmers on the principle of corn rents than there ever were before.—Mr. Cubitt, of Walsingham, found it impossible to keep up with the prices returned from the Norwich market, they were much more than he could make. He had asked a miller about it, and he replied that he had made no return at all for the last two years, and did not think others had done so. They were interested in keeping up the prices. Another gentleman agreed with Mr. Pain that both the producers and the buyers should make returns. He thought Mr. Pile's proposition to make the returns through the clerks of the boards of guardians would not be acceptable to the Poor-law Board. He differed from Mr. Lear as to the propriety of confining the area of the returns to pitched markets; he would rather extend it to every market in the kingdom. He thought it would be very easy for farmers to make such returns, including the corn they might send to their mill or use at home; there would then be a fair account of all the corn in the kingdom.

A conversational discussion followed upon the different points raised, in which Mr. Birt, of Blandford, Mr. Wingate, of Lincolnshire, Mr. Skelton, and other gentlemen took part. After a few remarks from the Chairman, Mr. Pain rose to express his gratification that the subject had been so thoroughly discussed, and observed that opinions were so unanimous on the matter that there was nothing left for him to reply to. The Chairman stated that Mr. Pain had withdrawn his resolution in favour of one proposed by Mr. Baker, but on the matter being put to the meeting, Mr. Pain's resolution, quoted above, was carried by a large majority.—A deputation from the Central Farmers' Club had an interview with Mr. Cardwell at the office of the Board

of Trade in reference to this subject on the following day. The deputation consisted of Sir J. Shelley, M.P., Mr. Fisher Hobbs, the Chairman, Mr. Corbet, the Secretary of the Club, Messrs. Pain, Pile, Reeves, and Spearing, from Hampshire; Messrs. Body, Coote, Davies, and Wood, from Sussex; Messrs. Cressingham, Staining, and Wood, from Surrey; Mr. Ambrose, from Essex; Mr. Burt, of Dorsetshire; and other gentlemen from Cambridge, Lincoln, and Kent.

Notices to Correspondents.

ARTIFICIAL MANURE: *Sub.* For Beans and Peas you should have a calcareous soil—more adhesive for the former crop than for the latter. If the soil is not naturally calcareous, your manure should contain lime. An artificial manure for Beans suggested by Mr. Huxtable contained 10 bushels of lime, 2 cwt. of superphosphate of lime, and 5 bushels of salt and ashes. If your land has been limed, you had better depend upon some nitrogenous substance for a top-dressing. Nothing is better than guano; say 3 cwt. per acre. If you have not got it, apply 20 or 30 bushels of soot, and 3 or 4 bushels of salt per acre.

DOG: *E M H.* Cleanliness, abstinence, and exercise; if these fail to remove the smell or diminish it, we fear there is only one remedy left, rather than adopt which you may probably think "What can't be cured must be endured." *W. C. S.*

FOOT ROT: *X.* A full answer next week. Meanwhile, we may mention that a dry lair, and the timely application of a mild caustic, as a dilute acid, to the part affected, after so much of the horny growth has been removed as to lay it bare, are remedies.

GLASS: *R L F.* Apply to Hetley & Co., 35, Soho Square.

ITALIAN RYE-GRASS: *Alpha.* Sow a bushel per acre, along with 10 to 15 lbs. of mixed Clover seeds early in March. You will have a good cut the same summer. If you sow it with a crop, you had better put it in somewhat later, say towards the end of April; and the stubble will furnish a good feed in the autumn. About Cotswold rams, there are many breeders who advertise at the proper season, near Cirencester, North Leach, Cheltenham, Moreton-in-the-Marsh, &c. We know nothing about the Cotswold and Cheviot cross; the Leicester ram is generally employed for crossing with the Cheviot ewe.

LIME: *A Green One.* We should prefer to apply lime some months before the time of vegetable growth. It is for what it does as much as for what it is, that it is useful; and if you apply it in the autumn, it will be usefully at work for you all through the winter. Our plan would be to apply lime compost on the lea just before breaking it up.

LUCERNE: *Amateur.* Will any one give his method and experience of the cultivation of this plant. The ordinary plan is to hoe in about 16 lbs. of seed per acre, in shallow trenches 12 to 16 inches apart, on a good loamy soil, somewhere about the end of April.

MANGOLD WURZEL: *Norfolk Farmer.* We have grown it to some extent thus:—When harvesting the general crop in September, select the best-formed roots, cart them to a field not of very rich soil, and not manured for the purpose, but which had been cleaned and deeply tilled; dig holes 30 inches apart every way, and put one root in each, the leaves having been removed, and the bulb being so deeply buried, that the whole is covered. It will sprout forth in March, flower in July, and ripen in August and September. The flower-stalks are to be cut as they successively become brown, and hung upon lines, or tied loosely in sheaves to dry. As a sort, we recommend the Orange Globe.

NEWINGTON'S DIBBLE: *J. Mackensie, M.D.* We did not know their sale had ceased; perhaps this notice of your communication may elicit information. The Suffolk drill, though complicated *looking*, is an efficient implement under a great variety of circumstances; we know instances in use now which are 50 years old. Small drills on that principle were exhibited at Gloucester; we think by Garrett, and Hornsby, and others. Ploughs with seed-boxes to sow one row are common; apply to Mr. Slight, of Edinburgh.

OATMEAL: *C S C.* We are asked where Oatmeal can be had at any reasonable price in London; and where Stafford's Indian meal can be bought wholesale and retail. This column is not intended to supersede the necessity of advertisements, for which the above are proper subjects.

OATMEAL CAKES: *A Distressed Housekeeper.* We have had a great many replies to your question, from which we take the following:—One only should be made at a time, as the mixture dries quickly. Put two or three handfuls of meal in a bowl, moisten with water merely sufficient to form into a cake; knead it round and round with the hands on the paste board, strewing meal under and over it; it may be made as thin as a wafer, or any thickness (generally about half the thickness of a traveller's biscuit). Put it on a hot iron plate called a griddle; bake it till it be a little brown on the under side, then take it off and toast that side before the fire which was uppermost on the griddle. The toaster is such as is commonly used for heating smoothing-irons, having a back to support the cake. To make these cakes soft (when that is required) they must not be toasted before the fire, but both sides be done quickly on the griddle. The griddle is a piece of round iron 1 foot in diameter, which any blacksmith can make, and must be laid on the fire, which should be flat. A trivet does very well for the toaster, putting the cakes on a plate.

PEATY SOIL: *A Young Farmer.* We should recommend Rape as a first crop, if you can get some clay incorporated with the soil, and get the whole into tolerable tilth by May. Rape fed off will make a good preparation for Oats and Grass seeds. Pasture for a year or two, and then break up for regular arable culture.

PIG FOOD: *B.* Bran, grains, the offal from the winnowing machine, malt refuse, &c., must be had resort to, if your stock of home food is out. We are unable to give the cost per head of food under such circumstances. Perhaps some of our readers may help you.

PIGEONS: *One Wishing for Information* should have had it most willingly had we possessed it ourselves.

POTATOES: *W Bartlett.* Select early sorts, The so-called "Prolific" Potato, which is to be had in the neighbourhood of Bristol, is a very good sort. Plant about a foot apart in the rows, which should be some 2 feet distant from each other.

ROT: *X.* Give dry food and access to Salt.

SMALL FARM: *J L* says, "I am an occupier of a very small farm of about 13 acres, 10 of which are in permanent Grass, and the remainder arable, and, as an amateur, I have a desire to cultivate it in the best possible way, looking forward at all times to make it a profitable undertaking. I am at present keeping three milch cows (the produce of which is readily disposed of) and four to five head of young stock (foals and heifers), besides two or three pigs. Now what I wish to know is, whether any of your many readers will kindly put me upon the best Belgian or other plan of cropping and stall-feeding; and whether or not a few sheep could be introduced advantageously amongst my stock: and, in order to make the task as easy as possible, I beg to say the present state of my arable land is now 1 acre of Clover, 1 acre of Wheat, and the remainder Turnip and Potato fallows. Should I have omitted to name anything needful to be known, I shall be glad to supply it on noticing the same in your valuable Journal.

SOAP: *C S C* some time ago asked for the receipt used in the Isle of Man for making soap with snow, as mentioned in the life of the Bishop of Sodor and Man, but not given clearly. A reply was not obtained, and is again requested.

SOOT: *W E.* It will keep without waste. If you cannot get guano, use nitrate of soda for your Wheat plant.

WESTMINSTER ABBEY OR VICTORY.—NELSON at the BATTLE of ST. VINCENT.—LEGGATT, HAYWARD, and LEGGATT beg to inform their Patrons and Friends that T. Jones Barker's last grand historical PICTURE of NELSON RECEIVING the SWORDS from the vanquished Officers on the Quarter-deck of the SAN JOSEF, on the memorable 14th of February, 1797, at the Battle of St. Vincent, is NOW ON VIEW at their Gallery, 79, Cornhill.

Court Circular, Nov. 24, 1853.—Windsor.—"Messrs. Leggatt had the honour of submitting to Her Majesty and His Royal Highness Prince Albert, Barker's painting of Nelson receiving the swords of the officers on the quarter-deck of the San Josef after the battle of St Vincent."

In consequence of the unfavourable state of the weather, the picture is exhibited by gas-light, and may be viewed from 10 till 6.

READ THE FOLLOWING AND JUDGE FOR YOURSELVES.—"The astonishing effect PARR'S LIFE PILLS have had upon me is such that I can scarcely believe that I am the same man I was a few months ago; I felt then as though my life was nearly ended; now I feel hearty, and able to undertake any description of work and exertion, without feeling that excessive fatigue I did previous to taking them. It is really and truly new life to me: I have given this statement voluntarily, for the benefit of those of my fellow-creatures who know but little of OLD PARR'S WONDERFUL LIFE PILLS."—CHARLES FOSTER. Ground Keeper to Henry Sheppard, Esq., Lincoln.—PARR'S LIFE PILLS will prove highly efficacious in bilious complaints, scorbutic eruptions, affections of the nervous system, lowness of spirits, palpitation of the heart, rheumatic pains in the head, limbs, and other parts of the body, oppression of the chest, indigestion, redundancy of bile, dizziness of the eyes, violent pains in the temple and across the forehead, impaired memory, sick headache, tremulous action of the whole frame, restlessness and bad dreams, stupor ific dozing, flatulency, costiveness, &c.—Sold by E. Edwards, 67, St. Paul's Churchyard; Barclay and Sons, Farringdon Street; Sutton and Co., Bow Churchyard; Hannay and Co., and Sanger, Oxford Street; and by all respectable Chemists and Medicine Vendors in town and country. In boxes, price 1*s.* 1½*d.*, 2*s.* 9*d.*, and in Family Packets, 11*s.* each.

PAINS IN THE BACK, GRAVEL, LUMBAGO, RHEUMATISM, GOUT INDIGESTION, FLATULENCY, NERVOUSNESS, DEBILITY, &c.

DR. DE ROOS' COMPOUND RENAL PILLS, as their name Renal (or the Kidneys) indicates, are a most safe and efficacious remedy for the above dangerous complaints. For depression of spirits, incapacity for society, study, or business, giddiness, drowsiness, nervousness, and insanity itself, when arising from or combined with urinary diseases, they are unequalled. Price 1*s.* 1½*d.*, 2*s.* 9*d.*, 4*s.* 6*d.*, 11*s.*, and 33*s.* per Box, through all Medicine Vendors, or sent (free) on receipt of the amount in postage stamps, by Dr. DE ROOS, 35, Ely Place, Holborn, London. At Home for consultation daily from 11 till 1, and 5 till 8, Sunday excepted. Advice and Medicines, 1*l.*

METCALFE AND CO'S NEW PATTERN TOOTH BRUSH, PENETRATING HAIR BRUSHES, AND SMYRNA SPONGES.—The Tooth Brush performs the highly-important office of searching thoroughly into the divisions and cleansing in the most extraordinary manner—hairs never come loose. Peculiarly penetrating Hair Brushes, with durable unbleached Russian bristles, which will not soften like common hair, and immense stock of genuine unbleached Smyrna Sponge, with every description of British and Foreign Perfumery, at METCALFE, BINGLEY, & Co.'s only Establishment, 130 B and 131, Oxford Street, second and third doors west from Holles Street.

CAUTION.—Beware of the word "from" Metcalfe's, adopted by some houses. Metcalfe's Alkaline Tooth Powder, 2*s.* per box.

COUNTY OF TIPPERARY—BARONY OF LOWER ORMOND.

TO BE LET, from the 25th of March, with immediate possession, the following LANDS:—Ballylina, West Farm, containing 140 acres, Irish; Mathew's Farm (part of Ballylina, W.), 62 acres; Castleview Farm, ditto, 105 acres; Lismalin Farm, 190 acres; Ballynahinch Farm, 82 acres. These Farms are on the estate of Lord Ashtoun, and are situated about eight miles from Portumna, to which there is water-carriage; and the nearest station on the Parsonstown Railway, now in progress, will be at about six miles distance.

The Land is suited for tillage under the 4 or 5-course rotation. There are good slated houses on three of these Farms; and any other buildings, which may be reasonably required, will be erected by the landlord. Mr. JAMES EGAN, the Steward, at Sopwell Hall, near Shinrone, will show these Farms.

TO BE SOLD, a SEED BUSINESS in one of the principal towns in the North of England. The premises are situated in the best business part of the town, are extensive and calculated for carrying on a large trade.—For further particulars, or to treat, apply, with real name and address, to A. Z., Office of this Paper. N.B. A Nursery Stock may also be had at a valuation, if desired.

DENYER'S NURSERY, celebrated for ROSES, &c., Established 26 years, consisting of Five Acres of Land, House and Seed Shop attached, of which a 14 years' Lease will be granted. The Proprietor being about to retire, is desirous of offering the above, as an opportunity that rarely occurs to the trade, with a first-rate ready-money connexion, and the Stock to be taken at a valuation, two-thirds to be paid on taking possession; time will be given to pay the balance. No Goodwill is expected.—Apply to Messrs. PROTHEROE & MORRIS, Leytonstone, Essex; or Mr. E. DENYER, on the premises, Loughborough Road, Brixton, within three miles of London.

TO AMATEURS.

TO BE SOLD, FANCY FOWLS AND EGGS.—Pure-bred Malays, that took prizes at Great Yarmouth and Norwich; White-faced Spanish, Progeny of Birds advertised in the *Times*, with challenge of 50*l.* to produce 12 to match them; Cochins, short-legged and well-feathered.—Address, J. C. DOWING, Great Yarmouth.

TO BE SOLD, FANCY POULTRY EGGS, warranted from the best Birds.—White, Buff, Lemon, Cinnamon, and Silver Cinnamon Cochin China, 2*l.* per dozen; Dorkings, 1*l.* do.; Aylesbury Duck, 30*s.*; Guinea Fowls, 8*s.*; Black Norfolk and White Turkeys, 2*s.* per egg; large Buff and Grey, 5*s.* per egg, only a few of these for sale. Birds of the above named Stock to be had on application to O. E. U. F., Mr. George Lea's, Ashbocking, Needham Market, Suffolk.

TO BE SOLD, BUFF COCHIN CHINA EGGS, from Birds that have taken prizes at the Derby, East Kent, Bristol, Taunton, and Yeovil Poultry Shows, at 1*l.* 1*s.* per dozen; also Partridge Cochin China Eggs, from Birds that have taken prizes at London Summer Meeting, Surrey Gardens' Show in August, Malvern, Yeovil, Honiton, and Torquay Poultry Shows, at 1*l.* 1*s.* per dozen.—Apply to JOHN R. RODBARD, Aldwick Court, Wrington, near Bristol.

CLEAR BUFF COCHIN CHINA FOWLS' EGGS may be had of Mr. GILBERT, Wine Merchant, Grays, Essex, from Hens bred by Thomas Sturgeon, Esq., in 1852, and reserved for stock at 16*s.* per dozen. They are unequalled for beauty, plumage, short legs, and great weight, with perfect clear golden hackle, and many of them falcon hockled. Also 50 very splendid first-class PULLETS for sale, nearly all clean in hackle. May be seen at any time.

GOLDEN SPANGLED HAMBURGH.—Eggs from Prize Birds may be obtained on application to Mr. TAYLOR, Godalming, Surrey.

PRIZE WHITE SHANGHAES.—An Amateur, who has during the past year been highly successful at our most important Exhibitions with this variety of Fowl, has for disposal a PRIZE COCK BIRD of unusual merit, bred by Mrs. Herbert in March last, which has already gained the First Prizes at the Gloucester, Metropolitan, and Bury Exhibitions, and Second Prize at the Surrey Gardens; he is a perfect model in shape, possessing bright yellow legs, and heavily booted down to his middle toes. Also for sale, a few SPLENDID PULLETS; including some Prize Birds of great merit.—For price, &c., apply to T. B. F., Post-office, Maldon, Essex.

FANCY POULTRY.

EDWARD H. STRANGE, Ampthill, Beds., has for sale a few pairs of the following birds:—Black Spanish, from Captain Hornby's strain; Two Hen Birds obtained 1st, 2d, and 3d prizes at the Bedford Exhibition, 1853; Golden Pencilled Hamburgh and White-bearded Polands, first prizes were awarded to each of these varieties at the Hitchin and Home Counties Exhibition 1853; White and Buff Shanghaes, fine heavy birds; Silver Spangled Hamburgh, these birds gained a prize at the Bedford Exhibition.

E. H. S. will have a few sittings of Eggs from each of the above Fowls to sell, and from the Staffordshire pile Game, from birds that took a prize both at Hitchin and Bedford. Price, and other particulars, sent on receipt of a directed envelope.

COCHIN CHINA FOWLS.

MR. EASON (whose Birds have taken First Prizes at the Metropolitan, Reigate, Hitchin, Yarmouth, Bury St. Edmund's, and other Poultry Exhibitions), has a few pairs of Birds to dispose of, from One Guinea a pair; also, several Cocks, weighing 10, 11, and 12 lbs., from Two to Eight Guineas each; and some short-legged, heavily-feathered Cockerels and Pullets, a pure buff colour, from One to Three Guineas each, all of which are first-rate Stock Birds. Eggs from pure Buff, and pure White Birds, at 12*s.* per dozen, including packing. The Birds may be seen any morning except Sunday, before 11 o'clock, at Montpellier House, South Lambeth, London.

Sales by Auction.

DR. ALLEN'S PRIZE WHITE AND BUFF COCHIN CHINA FOWLS.—PERIODICAL SALE.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, February 21, at 12 o'clock precisely—WHITE COCHINS, being part of the famed Stock of Dr. ALLEN, whose birds are of the greatest beauty, and have been always successful when exhibited; also some good Buff Birds from well-known breeders, Rouen Ducks, and other Fancy Poultry. Catalogues by enclosing a stamped-directed envelope to Mr. J. C. STEVENS, 38, King Street, Covent Garden.

FIRST PRIZE COLOURED DORKINGS.

MR. BRAY will Sell by Auction, on WEDNESDAY, the 15th inst., 20 Lots first-rate DORKINGS, including two Pullets, first prize at Southampton and Surrey Winter Show; also a Cock bred by the Rev. James Boys, second prize at Surrey Gardens; a Pullet from same strain, and some first-rate Cochins, bred from, and being themselves Prize Birds.—Catalogues of Mr. BRAY, 259, High Holborn.

KENSINGTON.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are commissioned by Mr. Holland to sell by Auction, on the premises, Kensington Nursery, Gloucester Road, in consequence of the ground being let for building, on MONDAY, February 27, 1854, at 11 o'clock, the whole of the choice and well-selected FRUIT TREES, consisting of Standard and Dwarf trained and untrained Peach, Nectarine, Apricot, Apple, Pear, Plum, Cherry, Damson, Medlar, Mulberries, Gooseberries, and Currants: 3000 Standard budded Muscle Stock, worked with Peach, Nectarine, and Apricot; also Evergreens; a quantity of Rhubarb; Hand Lights, Wheelbarrows, and sundry effects. May be viewed prior to the sale.—Catalogues may be had on the premises; of the principal Seedsmen in London; and of the Auctioneers, Leytonstone, Essex.

WOOLWICH.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. WILLIAMS, to sell by Auction, on the Premises, Bowater Nursery, Woolwich, on MONDAY, February 20, at 11 o'clock, without reserve, the lease having expired, and a portion of the ground being required for building, the whole of the NURSERY STOCK of Evergreens, Fruit and Ornamental Trees, comprising Aucubas, Bays, Laurustinus, Variegated Hollies, Fan Yews, Portugal Laurels, Standard Apples, Pears, Plums, Cherries, Gooseberries, Currants; Large Fruiting Pears, Apples, Cherries, &c.; Laburnums, Weeping and Common Ash, Walnuts, several beds of Asparagus, Vines, Evergreens in pots, together with a 23-light Pit; the erection of a capital shed, &c.—May be viewed prior to the sale; Catalogues may be obtained on the Premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

BANBURY, OXFORDSHIRE.

IMPORTANT AND EXTENSIVE SALE OF VALUABLE NURSERY STOCK.

MESSRS. DANBY and CALESS beg to inform the Nobility, Gentry, and their numerous friends that they have been commissioned by Thomas Perry, Nurseryman, Banbury, to offer for Public Competition, on TUESDAY and WEDNESDAY, 14th and 15th February, about one Million of fine healthy FOREST TREES, of nearly every description, including a very superior Stock of the True English Elms; 200,000 Evergreen and Flowering Shrubs; Fruit Trees, in great variety; a quantity of Thorn Quick-sets; and a large assortment of fine Specimen Plants, well adapted for New Pleasure Grounds. T. P. begs to call particular attention to his unrivalled collection of Roses. The above may be viewed the morning of Sale till 10 o'clock, at which time the Auction will commence. A punctual attendance at the time mentioned is requested, in consequence of the great number of lots and the shortness of the days.

HUNTINGDON.

TO NURSERYMEN, PLANTERS, AND OTHERS.

Large and Important Sale of Nursery Stock, in consequence of the Ground being required for Building Purposes.

G. M. FOX respectfully announces that he has received instructions from Messrs. Wood and Ingram to sell by Auction, on the 14th of March, 1854, and following days, the valuable and extensive stock of FRUIT and FOREST TREES, SHRUBS, &c., now growing in the George Lane, Huntingdon, being one of the Nursery Grounds occupied by them, and obliged to be cleared immediately for building purposes.—Catalogues, with full particulars, will be ready 10 days before the sale, and may be had at Messrs. HURST and M'MULLEN, 6, Leadenhall Street; the Office of the Journal of Auctions, 29, Essex Street, Strand; the principal Inns in the neighbourhood, and of the Auctioneer, Huntingdon.

COTTAM AND HALLEN,

The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.

May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,

JOHN WARNER & SONS,

8, CRESCENT, JEWIN STREET, LONDON.

Every description of Machinery for Raising Water; Fire Engines, &c.

An Illustrated Book sent on application post free.

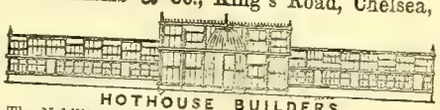
SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application.

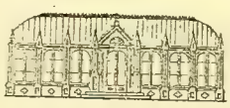
HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,



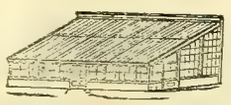
HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.



The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.



Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

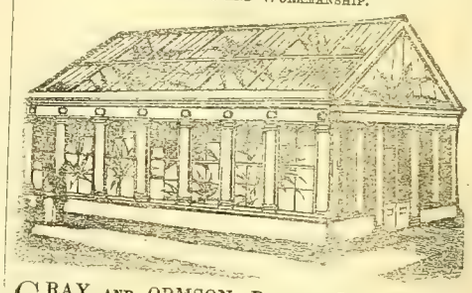
E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1*s.* 3*d.* per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8*d.* per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

HORTICULTURAL BUILDINGS, ROCK AND RUSTIC WORK, ORNAMENTAL WATER, FOUNTAINS AND FALLS, AND LANDSCAPE GARDENING, executed on the best principles; Estates Improved, Land Laid Out for Building, &c., by Mr. GLENNY, Valuer, Estate and Horticultural Agent, 420, Strand.

GREEN AND HOTHOUSES made by machinery at J. LEWIS'S HORTICULTURAL WORKS, Stamford Hill, Middlesex. Warranted of best materials; being made by steam-power, they are put together in a superior manner; one trial will prove these Buildings to be the cheapest and best made in England. 1¼ in. Greenhouse lights at 3*d.* per foot; 2 in. at 4½*d.* per foot. Lists of Prices by enclosing two postage stamps.

HOTHOUSES, CONSERVATORIES, &c., made and fixed complete, at a considerable reduction. CUCUMBER and MELON BOXES and LIGHTS of all sizes, made of the best materials, glazed and painted complete, kept ready for immediate use, packed and sent to all parts of the kingdom. Reference may be had to the nobility, gentry, and the trade in most of the counties in England.—JAMES WATTS, Hothouse Builder, Claremont Place, Old Kent Road, London.

GARDEN ENGINES, SYRINGES, &c. &c.—CAUTION.—The well-known reputation of READ'S ENGINES, MACHINES, and SYRINGES has led to the nefarious practice of placing cards in shop windows with the words "Read's Patent" upon Syringes of the very commonest description. R. READ begs to caution the Public against being deceived by such false representations, as many of these instruments, upon trial, will be found defective and useless. READ'S instruments have the Royal Arms, with the address 35, REGENT CIRCUS, LONDON.—*⁂* Descriptions sent Post free.

SUPERB NOVELTIES IN PAPIER MACHE, at MECHI'S, 4, Leadenhall Street, London.—A Visit to his establishment will prove that there is not in London another such stock of Elegancies. They consist of Tables, Envelope Cases, Netting Boxes, Companions, Cabinets, Jewel Cases, Work Boxes, Dressing Cases, Tea Caddies, Hand and Pole Screens, Card Racks, Table Inkstands, Regency Writing Desks, Portfolios, Playing Cards, and Visiting Card Cases, Cigar and Bottle Cases, Note and Cake Baskets; also an assortment of Needle Cases, in Pearl and Tortoiseshell, Silver and Gold Pencil Cases, Pen Holders, and other Articles suitable for Presents. Inventor of the Patent Castellated Tooth Brush.

HEAL & SON'S ILLUSTRATED CATALOGUE of BEDSTEADS, sent free by post; it contains designs and prices of upwards of 100 different Bedsteads, in iron, brass, japanned wood, polished birch, mahogany, rosewood, and walnut tree woods; also of every description of bedding, blankets, and quilts.—HEAL & SON, Bedstead and Bedding Manufacturers, 196, Tottenham Court Road.

QUALITY THE TEST OF CHEAPNESS.

BERDOE'S LIGHT OVERCOATS AND CAPES resist any amount of rain. One of the largest Stocks in London of Superior GARMENTS at Lowest Charges. First-Class DRESS COATS, 3*l.*; BOY'S SUIT, 11*d.* per inch, according to height.—96, New Bond Street, and 69, Cornhill. (Nowhere else.)

FORD'S EUREKA SHIRTS, Plain and Coloured, the latter in cloths of every variety of pattern—stripes, curves, bars, spots, sprigs; in short, every figure that art can describe and taste approve. Six for 27*s.* Patterns to select from on receipt of six penny stamps. Price lists free on application.—RICHARD FORD, 38, Poultry, London.

NO CHARGE FOR STAMPING ARMS, CRESTS, INITIALS, &c., on paper and envelopes, at LOCKWOOD'S well-known establishment, 75, New Bond Street. Good cream-laid Note-paper, five quires for 9*d.*; Thick ditto, five quires, 1*s.*; Albert and Queen's sizes, five quires for 6*d.*, 9*d.*, and 1*s.*; Envelopes, 3*d.* to 1*s.* 6*d.* per hundred; Foolscap paper, 7*s.* 6*d.* per ream; Copybooks, 2*s.* 6*d.* per dozen. Card Plate engraved, 2*s.* 6*d.*; 100 Cards printed, 2*s.* 6*d.* Mourning Stationery equally cheap. Wedding Orders promptly executed. A large variety of Writing and Dressing Cases, Envelope Boxes, Blotting Books, Inkstands, Gold Pens, Church Services, &c. Copy address, LOCKWOOD'S, 75, New Bond Street. Country orders for 20*s.* sent carriage free.

KNOW THYSELF!—Professor BLENKINSOP continues to receive from individuals of every rank the most flattering testimonials of his success in describing the CHARACTERS of Persons from their HANDWRITING, pointing out their mental and moral qualities, whether good or bad.—Address by letter, stating age, sex, and profession, inclosing 13 uncut postage stamps, to Dr. BLENKINSOP, 344, Strand, London.

WM. HALSE'S FIVE GUINEA APPARATUSES are now ready.—Invalids are solicited to send to Mr. W. HALSE, of 22, Brunswick Square, London, for his Pamphlet on MEDICAL GALVANISM, which will be forwarded free, on receipt of two stamps. In it will be found the particulars of cures in cases of asthma, rheumatism, sciatica, tic doloureux, paralysis, spinal complaints, headache, deficiency of nervous energy, liver complaints, general debility, indigestion, stiff joints, nervous disorders, &c. Mr. HALSE'S method of applying the galvanic fluid is quite free from all unpleasant sensation. Terms: One Guinea per week. The above Pamphlet contains his Letters on Medical Galvanism.

PRIZE MEDAL—1851.
AT A VERY ECONOMICAL RATE.

SAMUEL CUNDY, Mason and Builder, Pimlico Marble and Stone Works, Belgrave Wharf, Lower Belgrave Place, Pimlico, London.

Marble Chimney-pieces manufactured by improved machinery. The public are invited to view the stock, unequalled for quality and price. A good Marble Chimney-piece for 40*s*. Marble Work in all its branches at a remarkably cheap rate for Halls, Dairies, Larders, &c. Circulars sent on application.

N.B. The "Royal Blue" Omnibuses pass the Works every ten minutes from the Bank.

GREAT SAVING OF TIME AND MONEY.

RESTELL'S PATENT ECONOMICAL GAS APPARATUS for Forcing Houses, Greenhouses, Conservatories, Pits, Shops, Counting Houses, Warehouses, Drying Rooms, &c. &c., possessing all the advantages of Hot Water at half the expense of fitting, and most trifling cost for Gas, far surpassing any ordinary Gas Stove, requiring no furnace, and allowing of no fumes or evaporation in the Building, or possibility of accidents from negligence or carelessness. It has been tested through the late severe weather, on a variety of Plants, and found most satisfactory. It is very quickly fitted up and requires no night attention.—Apply to the Inventor and Patentee, R. Restell, 35, High Street, Croydon, Surrey.

Persons wishing to have Houses fitted will please to send the height and dimensions.

THE COTTAGER'S STOVE.—An economical, compact, and portable COOKING APPARATUS, combining a good sized Oven and Hotplate; may be had with or without a boiler, and will cook sufficient for a dozen persons with the consumption of 1 lb. of coal or coke per hour. It requires no fixing, may be placed in any apartment, and is a great security against accidents from fire. It will burn Coal, Coke, or Wood. They are also specially adapted for Emigrants, and may be seen in operation daily, at the Manufacturers', D. & E. Bailey, 272, High Holborn, London.—Price 50*s*., and upwards.

FIRE ANNIHILATOR, OR VAPOUR FIRE ENGINE.—Its practical value proved incontestably by 23 remarkable cases of successful use. See "Bradshaw" of last month, p. 132. Engines for Dwelling-houses, 3*l*. to 4*l*.—Office of the Fire Annihilator Company, 105, Leadenhall Street, London.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

BAILY'S ROUP and CONDITION PILLS for POULTRY.—This remedy has been extensively tried with uniform success, and is offered to amateurs and the public with the greatest confidence. It will effectually overcome that disease which has hitherto been the bane of the poultry-yard, and destroy that apprehension known to all poultry keepers, when a favourite and valuable fowl is seen to droop. It is inestimable for poultry returning from exhibitions, and greatly facilitates moulting.—Sold, with full instructions for use, in boxes containing 50 pills, by John Baily, 113, Mount Street, Grosvenor Square, price 3*s*. per box, or by post 3*s*. 4*d*. "Fowls, by Baily," the most useful and plainest treatise of the day; price 2*s*., by post 2*s*. 6*d*.

Baily's Registered Fountains, universally adopted and approved. Drawings and particulars, by post, on application.—113, Mount Street, Grosvenor Square.

CUCUMBER and MELON BOXES and LIGHTS.—One hundred 1, 2, and 3-light Boxes and Lights of all sizes, ready for immediate use. Warranted best materials, packed and sent to all parts of the kingdom; 2-light Boxes and Lights from 1*l*. 6*s*. Garden Lights of every description, Conservatories, Green and Hothouses made and fixed in all parts of the kingdom. References given to the nobility, gentry, and the trade, in most of the counties in England.—James Watts, Hothouse Builder, Claremont Place, Old Kent Road, London.

SUBSTITUTE FOR GARDEN MATS.—Transparent Sheeting, nearly 2 yards wide, 1*s*. per yard; thick Canvas do., 1*s*. per square yard; Waterproof Roofing Canvas, 6 feet wide, 2*s*. per yard run, is ready for use, and requires no tarring or other preparation for use.—R. Richardson, 21, Tonbridge Place, New Road, London.

N.B.—Policemen's Capes, 18*s*. and 24*s*. per dozen.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.

"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s*. 6*d*. per yard run, of E. T. Archer, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.

The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.

Manufacturers of the Cement, J. B. White & Brothers, Millbank Street, Westminster.

DILCOCK'S BRIDE BROCCOLI.

BAINBRIDGE and HEWISON (late Jas. Edward), have the pleasure of again offering to their friends and the public their DILCOCK'S BRIDE BROCCOLI, at 2*s*. 6*d*. per packet; and while returning their thanks to their numerous patrons of last season, they beg to refer them to the following extract, taken from the *Yorkshireman* newspaper of the 30th of April last, when it was exhibited at York, for the fourth time:—"Mr. Dilcock deservedly obtained all the three prizes for Broccoli with his seedling—the 'Bride.' Taking the season into account, these vegetables were really remarkable specimens." It was equally successful the two previous years.

B. & H. are prepared to send out their Catalogues of Kitchen Garden and Flower Seeds, post free, on application, and also their Catalogue of Plants early in March, containing Stove, Greenhouse, &c., including many of the newest and choicest of the season. Their Seeds will be of the very best quality, and in the greatest possible variety.

Sold Wholesale by Noble, Cooper, & Bolton, Fleet Street; Chadwood & Cumming, Covent Garden; and by all respectable Seedsmen in town and country.—York Nurseries, Feb. 11.

IMPROVEMENT OF GRASS LANDS.

SUTTON'S RENOVATING GRASS SEEDS FOR IMPROVING OLD PASTURES.—Many Old Upland Pastures, Parks, and Meadows are nearly destitute of Clovers and the finer and more nutritious sorts of Grasses, in which case we are in the practice of furnishing such sorts only as are wanting. If the Seeds are *sown early in the season*, the improvement in the Pasture will be very considerable, and at a small expense.

The following is similar to many other letters received from former purchasers:—

From D. T. Cunynghame, Esq., Wellesbourne, Warwick, Nov. 1852.

"The meadows that were renovated with your Seeds are looking very well. I cut nearly 2 tons of hay to the acre, and three years ago the same land hardly produced half a ton per acre. The Garden Seeds I have had from you exceed by far any that I have bought elsewhere."

Quantity of Seed required, 8 lbs. to 12 lbs. per acre. Price 1s. per lb., Carriage Free.—Address

John Sutton & Sons, Seed Growers, Reading, Berks.

N.B.—We have a very fine Stock of Mangold Wurzel and Carrot Seed.

A FIRST CLASS CATALOGUE OF GERANIUMS, VERBENAS, FUCHSIAS, DAHLIAS, HOLLYHOCKS, ETC.

GEO. SMITH begs to announce that the above is now ready and will be forwarded in exchange for one postage stamp.—Tollington Nursery, Hornsey Road, Islington.

CORN MARKET, WISBEACH, CAMBRIDGESHIRE.

CHARLES SHARPE begs to call the attention of the nobility, gentry, and trade to the undermentioned choice collection of SEED POTATOES, grown with great care upon marsh land near the sea, which is the most appropriate soil for the culture of the Potato, as it is less affected by the disease, and of finer quality. The undermentioned prices include hampers and package. Smaller quantities can be had if required. The Trade Price can be had on application.

POTATOES (For Forcing and Early Planting).

Per bushel of 4 stones.		Per bushel of 4 stones.

Forty Fold	10*s*.		

THE CHAMPION PEACH.

THOMAS HUTCHINGS, Nurseryman, &c. Axminster, is now sending out this beautiful Seedling Peach, which far surpasses everything of the kind ever offered to the Public, measuring the extraordinary size of from 11 to 13, and sometimes 14 inches—flesh free, rich, and juicy; flavour unequalled—somewhat resembling the Green-gage Plum—an excellent bearer—and in every respect of first-rate quality.

Trained Trees ..... £1 1*s*. 0*d*.
Maiden ditto ..... 0 10*s*. 6*d*.

It is respectfully requested that all orders from unknown correspondents be accompanied by a Post-office order, payable at Axminster, Devon.

TESTIMONIAL.

"Sir.—I have fruited the Champion Peach, and have proved it to be *quite equal* to the description, and well worthy the name given it. I am ready to answer any inquiry that any lady or gentleman may wish to make.—I am, Sir, yours respectfully,

"John Reynolds,

"To Mr. Hutchings. "Belmont, Lyme Regis, Dorset."

Orders received at the Nursery, or by Messrs. Hurst and MacMullen, 6, Leadenhall-street, London; and by Messrs. Garaway, Mayes, and Co., Durdham Down Nurseries, Bristol.

February, 1854.

EXOTIC NURSERY, CANTERBURY.

WILLIAM MASTERS, at the commencement of a new season, has the pleasure to tender his very grateful thanks to his numerous Patrons for the very kind support with which they have favoured him during the last thirty-five years, and begs to solicit a continuance of the same on behalf of himself and his Son, with whom he has now entered into PARTNERSHIP, and who has been engaged with him in the practice of Landscape Gardening and the various branches of his business for some years.

WILLIAM MASTERS and SON beg to offer the following Collections of GARDEN SEEDS, in assortments containing a supply for the whole year in proportionate quantities of each.

No. 1 Collection, for a large garden, containing 20 quarts of Peas in 20 best sorts for succession, 10 best sorts of Broccoli, 8 ditto of Lettuce, with all other vegetables in proportion	£2	10	0
No. 2, the best new and other sorts, in smaller quantities	1	10	0
No. 3, ditto ditto	1	0	0
No. 4, a Collection of esteemed kinds for a small garden	0	10	0

Grass Seeds for Lawns, Permanent Pasture, or alternate Culture.

FLOWER SEEDS, with printed Directions for their Culture, in Collections of 12 for 2*s*. 6*d*.; 25 for 5*s*.; 50 for 9*s*.; 100 for 18*s*.

Their New Seed Catalogue for 1854 will be forwarded on application.—February 11.

THE PLANTING SEASON.

FRANCIS and ARTHUR DICKSON and SONS respectfully invite the attention of Planters to their very extensive Stock of Forest and Ornamental Trees, Evergreens, and Flowering Shrubs, Fruit Trees, Roses, Herbaceous and Alpine Plants, Stove and Greenhouse Plants, &c., growing at their Upton Nursery Grounds, near Chester. The Nurseries lying high and exposed, the whole of their Plants are hardy and well-grown, and having been regularly transplanted are also well rooted, and cannot fail to give satisfaction.

The following Lists are published, and will be forwarded on application:—Forest and Ornamental Trees and Shrubs, Fruit Trees (Descriptive Catalogue), Roses (Descriptive Catalogue), Herbaceous and Alpine Plants, Stove and Greenhouse Plants, Dahlias, Bedding-out Plants, Florists' Flowers, &c.

☞ It being necessary to clear the plants off certain portions of their Grounds before the end of March, F. & A. D. & Sons will dispose of this part of their Stock at much reduced prices, rather than incur the expense of removing them to other parts of their Nurseries.—Upton Nurseries, Chester, Feb. 11.

NEW AND SUPERIOR SEEDS.

FRANCIS and ARTHUR DICKSON and SONS, respectfully intimate that their CATALOGUE OF VEGETABLE AND FLOWER SEEDS, &c., for the present season is published, and will be forwarded on application. Their Stock of NEW SEEDS is now complete, and as each article has been procured direct from the most particular and careful growers, they feel satisfied that the quality of their Seeds is such as cannot fail to merit the approbation of their customers and friends.

F. & A. D. & Sons further beg to assure their patrons that everything supplied by them shall be of the first quality; and that all orders entrusted to them shall be executed with fidelity and despatch.

Seed Warehouses, 106, Eastgate Street, Chester, and 14, Corporation Street, Manchester.—Feb. 11.

SUPERB LATE WHITE BROCCOLI—"EMPEROR."

EDMUND PHILIP DIXON having purchased the entire stock of the above Broccoli of Messrs. Elletson, Market Gardeners, Thorngumbald, near Hull, begs to announce that he is prepared to send it out in sealed packets at 2*s*. 6*d* each. This Broccoli has been raised by the Messrs. Elletsons the raisers of the Mammoth, sent out some time ago, who state that the EMPEROR, if sown at the same time, will come into use before it. Is of very dwarf growth, perfectly hardy, with heads from 15 lbs. to 20 lbs. weight; keeps its colour, and stands firm three weeks after it is ready to cut. A noble flower and commands the best price of any other in the Hull market, where it is well known, and will be a great acquisition to the market gardeners around London, as well as those who wish for a first-rate Broccoli.

May be had of Messrs. Noble, Cooper, & Bolton, 152, Fleet Street; and Messrs. Hurst & M'Mullen, 6, Leadenhall Street London. Also of the Advertiser, 57, Queen Street, Hull.

STRONG EVERGREEN PRIVET, &c., for Fences, 2½ ft, 15*s*. per 1000. Fine Transplanted Spruce, 2 ft., 15*s*. per 1000. Limes, 3 to 4 ft., 30*s*. per 1000; Spanish Chesnut, 2 ft., 25*s*. per 1000. Horse Chestnut, 3 to 4 ft., 40*s*. per 100. Ash, 3 ft., 15*s*. per 1000. Sycamore, 2 ft. 15*s*. per 1000.

Hardy Herbaceous Plants (each sort by name), purchasers' selection, 35*s*. per 100. Shrubs, flowering and evergreen, 30*s*. per 100, purchasers' selection, our selection 25*s*. each. Vegetable and Flower Seeds of the best quality, see advertisement in the *Gardeners' Chronicle*, January 28.

Address all orders and communications to HENRY MAY, the Hope Nurseries, near Bedale, Yorkshire.

CUCUMBERS, MELONS, &c., the best varieties in Cultivation:—

CUCUMBER SEED—Captivation, 2*s*. 6*d*. per packet; Phenomenon, 2*s*. 6*d*.; Victory of Bath, 1*s*.; Lord Keynon's Favourite, winter Cucumber, 2*s*. 6*d*.; Gordon's White Spine, 1*s*.; Chamberlain's Essex Hero, 2*s*.; Sunderlandwick, 2*s*.; Hunter's Prolific, 1*s*.; and numerous others at 1*s*. per packet.

MELON SEED, at 1*s*. per packet—Incomparable, Bromham Hall, Golden Ball, Queen, Bowood, Victory of Bath, Camerton Court, Beechwood, Windsor Prize, Emperor, Fleming's Trentham Hybrid, Hampton Court, Blackhall's Green Flesh, Bailey's, and numerous others at 1*s*. per packet.

A packet of each of the first-named Cucumbers, and two packets of either of the Melons named, sent free for 60 stamps.

SUPERB HOLLYHOCK SEED, 2*s*. 6*d*. per packet.—GERMAN ASTER SEED (very fine and double), 1*s*. per packet.—ANTIRRHINUM SEED (splendid), 1*s*. per packet.—For further particulars respecting the before-mentioned Seeds see this Paper of the 21st inst.

A remittance must accompany every order by cash, or penny postage stamps, when the whole or any part of the above will be sent immediately, postage and package free.

EDWARD TILEY, Nurseryman, Seedsman, & Florist, 14, Abbey Church Yard, Bath.

RENDLE'S PRICE CURRENT.—*Opinion of Mr. James Barnes, the well-known Gardener to the Right Honourable Lady Rolle, Bicton:*—

"Dear Sir,—Your Price Current has just come safe to hand, and I beg to return my best thanks for the same. It contains a great deal of useful information for all classes, more particularly for the Amateur and those who cultivate their own Gardens and Allotments.—Yours, &c. "James Barnes."

RENDLE'S PRICE CURRENT.—*Opinion of Mr. W. Tillery, Gardener to His Grace the Duke of Portland, Welbeck:*—

"My dear Sir,—I beg to return many thanks for the copy of 'Rendle's Price Current and Garden Directory for 1854.' As far as my experience goes, I think your Calendar of Operations excellently planned, and the Directions are judicious and quite up to the mark for the present progressive period. The remarks on the systematic rotation of vegetable cropping are likewise excellent and will do much good if carefully put into force.—Yours truly,

"To Mr. Errington. "W. Tillery."

RENDLE'S PRICE CURRENT *has been already favourably noticed by the following Newspapers and Magazines:*—

"Mark-Lane Express," "The Lady's Newspaper and Pictorial Times," "The Florist, Fruitist, and Garden Miscellany," "The Gardener's and Farmer's Journal," "The Agricultural Magazine," "The Plough," "Lloyd's Weekly Newspaper," "Plymouth Herald," "Exeter Gazette," "Bristol Mercury," "Western Luminary," "Somerset County Herald," "The Clerical Journal," "Cornish Telegraph," "Plymouth Mail," "Devonport Telegraph," "Somerset Gazette," "Western Courier," "Teignmouth Gazette," "West Briton," "Portsmouth Times," and "Naval Gazette," and several other newspapers and Magazines.

NEW POTATO—DEAN'S SEEDLING.

ABRAHAM STANSFIELD, in sending out the above Potato, would particularly recommend it to the attention of all growers of this useful esculent, as being, all properties considered, the best sort yet raised. Like its parent, the Fluke, it is less liable to be diseased than any other variety, remaining vigorous and healthy when all others are cut down. It is about three weeks earlier than the Fluke, much superior in its farinaceous properties, has shallow eyes, a slight roughness of the skin, and is every way a superior variety for the table. It was exhibited at the Hapton and Padiham Exhibitions in 1852 and 1853, at each of which it received the first prize; it was also exhibited at the East Lancashire Horticultural Exhibition, and received a certificate of merit. It also received the following testimonial:— "Burnley, Sept. 22, 1853.

"We, the undersigned, beg to testify to the merits of a seedling Potato raised by James Dean Hapton, as being a very useful table variety, good keeper, and hitherto free from disease."—Signed, H. Walton, Florist, Marsden; R. Taylor, Gardener to Le Gendre Starkie, Esq., Huntroyd, near Burnley; T. Whitham, Gardener to J. Hallam, Esq., Marsden Hall, near Burnley; J. Redman, Gardener to Charles Townley, Esq., Townley, near Burnley; J. Lewis, Gardener to W. Thursby, Esq., Ormerod House, near Burnley; J. Dean, Gardener to Rev. W. Masters Burnley, and many others.

The *Preston Guardian* of Sept. 24, 1853, in noticing the East Lancashire Exhibition, says, "Amongst the roots shown we particularly noticed a splendid sample of Potatoes—Dean's Seedling—which possessed the recommendation of a rough skin and being free from eyeholes. Several had been boiled, and they appeared all that could be wished in a Potato."—The same paper of Oct. 1st says, "That important desideratum, a Potato free from disease, has been raised by Mr. Dean, near Burnley." Mr. Gleany, in the "Gardeners' Almanack" for 1854, says "We ought to mention a capital and very handsome new sort of Potato, Dean's Seedling, handsome and well flavoured, and moreover an excellent boiler." Mr. Edwards, secretary to the National Floricultural Society, in a private letter, says Dean's Potato is a perfect gem.

A. Stansfield will commence sending out the above Potato the second week in February, at 7*s*. per stone of 14 lbs., sacks and bags included. Early orders are respectfully solicited, as the stock is very limited. Post Office Orders or reference are requested from unknown correspondents.

A. S. can also supply the genuine Fluke Potato, at 9*s*. per bushel of 56 lbs., sacks and bags included.

Vale Gardens, Todmorden, Lancashire.

PRICED LIST OF SEEDS FOR FEBRUARY,

OFFERED BY

J. C. WHEELER & SON, GLOUCESTER,

SEEDSMEN TO THE GLOUCESTERSHIRE AGRICULTURAL SOCIETY.

GRASS SEEDS.—CARRIAGE FREE.

WE have for some time paid considerable attention to GRASS SEEDS, and especially in mixing them in such proportions as the nature of the soil and other local circumstances may require, so as to form fine Pastures. Having had much experience in this branch of our business, and the Grass Lands we have laid down having given great satisfaction, it is with much pleasure that we can recommend a fine mixture of the best Grasses and Clovers, suitable for the formation of a rich Permanent Pasture, at 30*s.* per acre. For improving the quality of Grasses already laid down, we can supply a good mixture at 1*s.* per lb. For the information of those gentlemen who would prefer buying the varieties separately, and mixing them themselves, we have given a short description of some of the best sorts. About 2 bushels of Grass Seed, and 12 lbs. of Clover is the quantity usually sown to the acre.

ITALIAN RYE GRASS—Imported Seed ... per bushel 7*s.* 0*d.*

Too much cannot be said in favour of this very excellent Rye-grass. Compared with any other of the varieties of common Rye-grass, the Italian affords a stronger braird, arrives sooner at maturity, has a greater abundance of foliage and of a lighter and more lively green colour, grows considerably taller, and is more upright, or less inclined to spread on the ground. Another of its distinguishing characteristics is, that it is much preferred by cattle to any of the common sorts, and is greedily eaten by them, whether green or dry. Imported seed is very much superior to that saved in this country.

PERENNIAL RYE GRASS ... ... per bushel 6*s.* 0*d.*

MEADOW CATSTAIL, OR TIMOTHY GRASS (Phleum pratense) ... ... per lb. 0 10

The Timothy Grass possesses the advantage of affording double the quantity of nutriment when its seeds are ripe, that it does if cut when in flower. On strong, tenacious, and rather moist soils, it is entitled to a precedence to almost any other, and should at least form a considerable portion of the mixture employed for sowing down such, either for alternate husbandry or permanent pasture.

MEADOW FOXTAIL GRASS—(Alopecurus pratensis) ... ... per lb. 1*s.* 6*d.*

This is one of the earliest and best of Pasture Grasses, but not so well adapted for hay, as it produces but few stalks; its root leaves are very broad, long, soft, slender, and grow rapidly when cut, or when eaten down by live stock. It requires two or three years after sowing to arrive at full maturity.

ROUGH COCKSFOOT—(Dactylis glomerata)... per lb. 1*s.* 0*d.*

Is a valuable Grass in cultivation, on account of the great quantity of produce which it yields, and the rapidity with which its leaves grow after being cut. It is well adapted for growing in shady moist places under trees, as in orchards, &c.

MEADOW FESCUE GRASS—(Festuca pratensis) per lb. 1*s.* 0*d.*

This is an excellent Grass, either for alternate husbandry or permanent pasture, but more particularly the latter. It is well liked by all kinds of herbivorous animals.

HARD FESCUE GRASS—(Festuca duriuscula) per lb. 1*s.* 0*d.*

Will thrive on a great variety of soils, and is found to resist the effect of severe drought in summer, and to retain its verdure during winter, in a remarkable degree. From the fineness of its foliage and greenness in winter, it is well adapted for sowing in Parks, especially for sheep pasture.

SHEEP FESCUE—(Festuca ovina) ... ... per lb. 1*s.* 0*d.*

This Grass forms the greater part of the Sheep pasture of the Highlands. In quantity of Grass it is much inferior to the other cultivated Fescues; but, from being well liked by sheep, it should always enter into the composition of mixtures of lands on which they are to be pastured; in fact, on the authority of Linnæus, these animals have no relish for hills and heaths which are destitute of this Grass.

WOOD MEADOW GRASS—(Poa nemoralis) ... per lb. 1*s.* 3*d.*

Its habit of growth is delicate, upright, close, and regular. There is no Grass better adapted for Pleasure-grounds, particularly under trees, as it will not only grow in such places, but forms a fine sward where few of the other fine Grasses can exist. It produces a considerable deal of foliage early in spring.

ROUGH-STALKED MEADOW GRASS—(Poa trivialis) ... ... per lb. 1*s.* 0*d.*

This is a valuable Grass as a mixture for Grass Lands, particularly on damp soils. Its habit of growth fits it for mixing along with the upright grown sorts, such as the Italian Rye-grass.

SMOOTH-STALKED MEADOW GRASS—(Poa pratensis) ... ... per lb. 1*s.* 0*d.*

This Grass yields a large quantity of herbage at a very early period of the season.

SWEET-SCENTED VERNAL GRASS—(Anthoxanthum odoratum) ... ... per lb. 2*s.* 0*d.*

This Grass yields but a scanty portion of herbage, yet, on the whole, Permanent Pasture should not be without a mixture of it, particularly in parks and pleasure grounds, were it for no other reason than its pleasant scent, not only when cut for hay, but also when the seeds become nearly ripe.

CRESTED DOGSTAIL GRASS—(Cynosurus cristatus) ... ... per lb. 1*s.* 6*d.*

From this Grass forming a close turf, and having rather fine foliage, it may be advantageously sown on lawns and other places to be kept under by the scythe.

LAWN GRASS SEED ... ... per lb. 1*s.* 0*d.*

By sowing this Grass a fine sward may be obtained in a short time, at one quarter the expense of laying down turf. It is a selection of the FINEST *Grasses, and is entirely free from weeds. We can strongly recommend it to those about to form lawns or pleasure grounds.*

CLOVER—White Dutch ... ... per lb. 10*d.* to 1*s.* 0*d.*
" Red or Broad ... ... " 9*d.* to 0*s.* 10*d.*
" Trefoil ... ... " 5*d.* to 0*s.* 6*d.*
" Cow Grass, or Perennial Red Clover per lb. 1*s.* 0*d.*

A vast quantity of Clover Seed is grown in Gloucestershire, more particularly the Perennial Red Clover or Cow Grass. When the selection of the varieties of Grasses and Clovers is left to us, we invariably send a good proportion of this; for Permanent Pasture it is invaluable. It will at all times afford us very great pleasure to give any information in our power on the subject of laying down land for Pasture; the proportions of the different varieties of seed should vary according to the nature of the soil and other local circumstances, and whether the land is intended to be laid down permanently or for a year or two. Any inquiries sent to us shall have an immediate reply, and one to the best of our judgment.

AGRICULTURAL SEEDS.

(NOT BOUND BY THESE PRICES AFTER FEBRUARY.)

	Per lb.—*s.*	*d.*
CARROT—Large White Belgian	2	0
" Large Red Altringham	1	9
FRENCH FURZE OR GORSE	1	6
KOHL RABI	3	6
LUCERNE—Finest imported	1	0
PARSNIP—Large Cattle	2	0
VETCHES OR TARES—Spring		
" Winter		
SWEDE—True Bronze T...	1	2

It is with the greatest confidence that we can recommend this Swede; the smallness of its neck, and the great weight produced per acre, joined with its excellent quality, render it worthy of being very generally cultivated.

SWEDE—Skirving's ... ... per lb. 1*s.* 2*d.*

These varieties are highly esteemed.

" Laing's ... ... "
" Matson's ... ... "

TURNIP—Dale's Hybrid ... ... per lb. 1*s.* 0*d.*

The distinguishing characteristics of this esteemed variety are—foliage strong and luxuriant, roots of a large size and of a lightish yellow colour, with a light green top, having also a small neck and tap root; compared with any other of the common field sorts, it is found to arrive sooner at maturity, and consequently may be sown at a later period of the season.

TURNIP—Purple-top Yellow Scotch or Aberdeen...per lb. 1*s.* 0*d.*

This is an old and very deservedly esteemed variety, and is considered by some to come nearest the Swedes, in hardness and solidity of texture.

TURNIP—Green Globe ... ... per lb. 1*s.* 0*d.*

Roots of a fine globular shape, with a small neck and tap-root; very white under and green above the surface of the ground; of the medium size, and hard and firm in texture.

TURNIP—Pomeranian ... ... per lb. 1*s.* 0*d.*

This variety was introduced some years since from Pomerania, and may be considered as the most perfect globe Turnip in shape, as well as the most regular or uniform in growth. Its skin is of a smooth white and somewhat shining or transparent appearance; leaves smoothish, of a dark green colour, and whitish nerves.

	Per b.—*s.*	.
TURNIP—White Globe	1	0
" Early Stone or Stubble	1	6
" Green Round Norfolk	1	0
" Red Round Norfolk	1	0
" White Round Norfolk	1	0
" Tankards	1	0

MANGOLD WURZEL—Large Yellow Globe
" " Long Red
" " Long Yellow
" " Red Globe

We can very strongly recommend our large Yellow Globe Mangold. Some very large roots have been exhibited at the Agricultural Show in the City grown from Seeds supplied by us, many of the roots weighing from 30 lbs. to 40 lbs., and the average weight about 30 tons to the acre. Price of the Seed will be forwarded on application.

GARDEN SEEDS.

Our Priced List of Garden Seeds will be forwarded free by post. It is our earnest endeavour to send out all Seeds, whether for the Garden or Farm, of the very best quality, and true to name; and as many of the Seeds are our own growing, and all are proved before sending out, we generally succeed in giving complete satisfaction to our customers. We are in daily receipt of most gratifying letters and renewed orders from those we had the honour of serving last year; and as we deliver our Seeds Carriage Free, we very respectfully solicit the honour of an order from those who have not yet given us a trial. We have the pleasure of subjoining the notice our Seed Catalogue has received:—

"The Catalogue of Seeds sold by J. C. WHEELER & SON, of Gloucester, appears to us to deserve notice, because of the stand which its authors make, in common with ourselves and others, against the useless incomprehensible Seed Lists of the day. In this, as in all matters of taste, there will be a difference of opinion as to the relative qualities of varieties; yet the mass of buyers who have no fancies, but who dislike being perplexed, and are satisfied with what is excellent, will greatly prefer a short, select Seed List to an interminable labyrinth of names, which, for the most part, represent nonentities or rubbish. Messrs. WHEELER'S little book will do something to satisfy their expectations."

Gardeners' Chronicle, March 2.

We beg to offer the following Collections of Garden Seeds:—

No. 1.—A COMPLETE COLLECTION, SUITABLE FOR A LARGE GARDEN	£3 0 0
No. 2.—A COLLECTION OF EQUALLY CHOICE VARIETIES, BUT SMALLER QUANTITIES	1 10 0
No. 3.—A COLLECTION SUITABLE FOR A SMALL GARDEN	0 15 0

These Collections will be sent Carriage Free to any Railway Station in England or Wales.

FLOWER SEEDS.

We have selected out of our large collection of Flower Seeds the most beautiful and showy varieties, each sort distinct in colour, and calculated to produce a fine effect when planted out in beds or groups in the flower border. We have had each variety distinctly marked with its Botanical and English name, height, time of flowering, colour of the flower, manner of growing, whether erect or trailing, &c., the time it should be sown, and other valuable hints as to its cultivation. In selecting these varieties, we have been careful to exclude all which are shy bloomers or have an insignificant appearance, so that the collections will comprise only those which are really showy and handsome, and which we believe would prove to the entire satisfaction of any lady or gentleman who might be disposed to order them. The German Stocks and Asters especially are most superb. The Collections will be sent free by post to any part of the kingdom at the following prices:—

TWENTY EXTRA FINE VARIETIES, ALL DISTINCT AND BEAUTIFUL		5*s.* 0*d.*
FIFTY	DITTO	10*s.* 6*d.*
ONE HUNDRED	DITTO	20*s.* 0*d.*

SEED POTATOES.

PRINCE OF WALES.—This is an early and very excellent variety; both for forcing and for a general crop we can strongly recommend it. It is a round white Potato, exceedingly productive. Price, per peck, 2*s.* 6*d.*

ALSTONE KIDNEY.—This is a new variety, one of the most productive we have ever seen. Our stock of it is very short. Price, per peck, 3*s.*

NOTICE TO EXHIBITORS.

CHELTENHAM GREAT EXHIBITION. To Open June 1st, 1854.—Applications for Space under Sections II. & III., must be made previous to the 25th of March. Official Forms may be obtained of the Secretary, Mr. HENRY J. COCHRANE, 128, High Street, Cheltenham.

SEEDS DIRECT FROM THE GROWERS BY RETAIL,

IN COLLECTIONS OR OTHERWISE.—(CARRIAGE FREE BY RAILWAY.)

SUTTON'S COMPLETE COLLECTIONS OF KITCHEN GARDEN AND FLOWER SEEDS may still be obtained, and will be found most excellent. All orders faithfully executed in rotation in strict accordance with priority of our receiving the same.

SUTTON & SONS, SEED-GROWERS, Reading, Berks.

GRASS SEEDS, SEPARATE OR MIXED.

GENTLEMEN *intending to lay down land to Permanent Pasture, or for one or two years' lay, are recommended to communicate with us, stating the nature of the soil and situation, that we may advise as to sorts of Grass Seeds most suitable, and quote prices accordingly.*

JOHN SUTTON & SONS, SEED GROWERS, Reading, Berks.

THE BLACK BARBAROSSA,

"A GRAPE THAT DON'T KNOW HOW TO SHANK."

JOHN BUTCHER has fine fruiting plants, 10*s.* 6*d.*; good plants, 5*s.* 6*d.*, may be obtained of the above splendid Late Grape. London Agent, Messrs. DAWE, COTTRELL & BENHAM, 36, Moorgate Street; and JOHN BUTCHER, Nurseryman, Stratford-on-Avon.

PINE PLANTS.

JOHN A. WATSON has for Sale a splendid Stock of both Fruiting and Succession Plants at the following prices: Large Fruiting Plants, 12*s.* to 15*s.* each; Successions from 3*s.* to 8*s.* each. Post-office orders payable at Brentford.

Vine Gardens, Ealing, Middlesex.

JOHN COLE begs to inform the lovers of CALCEOLARIAS that he has a few choice Seedlings to dispose of, having succeeded in raising more than he has convenience to grow, and offers them, strong plants, at 4*s.* per dozen, or 25*s.* per 100. J. C. begs to state the seed was saved from choice impregnated spotted and striped varieties. A remittance solicited from unknown correspondents.

Keyfield Nursery, St. Alban's, Herts.

GEORGE CLARKE begs to invite purchasers to inspect his splendid Collection of ROSES, extending over 10 acres of ground. Fine Standards of the leading kinds, 18*s.* per doz.; Dwarf ditto, 12*s.* per doz. Catalogues can be had.

Evergreens, Coniferæ, fine trained Peaches, Nectarines, Apricots, &c., at very moderate charges. Strong Dielytra spectabilis, 5*l.* to 10*l.* per 100. Also 100 fine Specimen Erica depressa, which will be sold at a bargain.

Streatham Place Nursery, Brixton Hill, near London.

CRIMSON BOURSAULT CLIMBING ROSES.—Having a few hundreds remaining of this desirable variety for planting in shrubberies, covering walls, &c, they will be disposed of at the former prices, viz., 25*s.* per 100; extra strong, 30*s.*, in quantities of not less than 50.

C. G. WILKINSON, Western Rose Nursery, Ealing.

FIRST CLASS PRIZE VERBENAS.—The set of six, advertised by J. KEYNES in his Catalogue will be ready to send out the 21st of March, in fine well-established Plants, by post, free, for 20*s.*

These are six of the most beautiful Verbenas ever offered, and were much admired in the Surrey Gardens, the only place they were exhibited, and obtained First Class Certificates. Only a few sets left unordered.

JOHN KEYNES, Nurseryman, Salisbury, Feb. 18.

THE EARLIEST PEA IS "FAIRHEAD'S EARLY CONQUEROR." To be had of CLARKE AND CO., Borough, London; 2*s.* per quart (price per bushel on application).

THE ROYAL MOSS-POD PEA.—The attention of horticulturists and of the public in general is called to this new and peculiar PEA, as being surpassed by none in exquisite flavour and colour on table; it is at the same time highly productive. To be had only of Mr. DENNIS, West Court, Detling, Maidstone, at 2*s.* 6*d.* per quart, and will be forwarded in any quantity (not less than a quart), to all parts of the kingdom on receipt of postage stamps or post-office order for the amount.

JOHN JEYES, NURSERYMAN and SEED-MERCHANT, Northampton, begs to offer Agricultural Seeds of every kind, and the best quality: Horticultural and Floricultural Seeds in great variety and of the choicest selection; Ornamental Shrubs and Trees of various sizes and immense variety; a Fine Collection of Roses; Fruit Trees carefully selected from the finest proved sorts; a large Stock of Forest Trees; Russian Mats.

Plans and Estimates given for making Pleasure Grounds, Cemeteries, &c. Seeds selected and packed for Exportation. Experienced Gardeners recommended.

SUPERB DOUBLE HOLLYHOCKS.

WILLIAM CHATER has now ready a fine healthy stock of young plants of all the leading sorts. For price and description see General List, which also contains hints on their culture, with observations on the exhibition of Hollyhocks, &c. &c., and may be had by inclosing a postage stamp.

Saffron Walden Nursery, February 18

LOBELIA ST. CLARE.

ESTABLISHED ABOUT HALF A CENTURY.

SEED AND HORTICULTURAL ESTABLISHMENT,

SUDBURY, SUFFOLK.

BASS AND BROWN'S SEED AND PLANT LIST FOR 1854 is now complete, and supplied free for three penny stamps. It contains a considerable number of new and very choice kinds, both of Seeds and Plants, and much useful information.

In offering the 23d Annual Edition of our Seed Catalogue, we would remark that the usual care and attention have been bestowed in the selection and growth of every article which has come under our hands, and as our aim is to render our Stock as select as possible, the most scrupulous care is paid to avoid such as are not really an acquisition and calculated to give perfect satisfaction. Our List of Vegetable Seeds contains many valuable new additions, and in the Flower Seed department are several rich gems of recent introduction.

Owing to the late ungenial season for ripening and harvesting Seeds, which has rendered them very scarce, the prices of many are higher than previous years.

GOODS (not under 20s.) CARRIAGE FREE to all Stations in London.

A Copy of the Autumn Catalogue also supplied for three penny stamps.

ASSORTED COLLECTIONS OF VEGETABLE SEEDS.

The following, comprising the best in cultivation, including several new sorts of first-rate quality:—

FRUIT TREES of the choicest kinds.

Remittances requested from unknown correspondents.

SEED & HORTICULTURAL ESTABLISHMENT, SUDBURY, SUFFOLK.

NEW POTATO—DEAN'S SEEDLING.

ABRAHAM STANSFIELD, in sending out the above Potato, would particularly recommend it to the attention of all growers of this useful esculent, as being, all properties considered, the best sort yet raised. Like its parent, the Fluke, it is less liable to be diseased than any other variety, remaining vigorous and healthy when all others are cut down. It is about three weeks earlier than the Fluke, much superior in its farinaceous properties, has shallow eyes, a slight roughness of the skin, and is every way a superior variety for the table. It was exhibited at the Hapton and Padiham Exhibitions in 1852 and 1853, at each of which it received the first prize; it was also exhibited at the East Lancashire Horticultural Exhibition, and received a certificate of merit. It also received the following testimonial:—

"Burnley, Sept. 22, 1853.

"We, the undersigned, beg to testify to the merits of a seedling Potato raised by James Dean Hapton, as being a very useful table variety, good keeper, and hitherto free from disease."—Signed, H. Walton, Florist, Marsden; R. Taylor, Gardener to Le Gendre Starkie, Esq., Huntroyd, near Burnley; T. Whitham, Gardener to J. Hallam, Esq., Marsden Hall, near Burnley; J. Redman, Gardener to Charles Townley, Esq., Townley, near Burnley; J. Lewis, Gardener to W. Thursby, Esq., Ormerod House, near Burnley; J. Dean, Gardener to Rev. W. Masters, Burnley, and many others.

The *Preston Guardian* of Sept. 24, 1853, in noticing the East Lancashire Exhibition, says, "Amongst the roots shown we particularly noticed a splendid sample of Potatoes—Dean's Seedling—which possessed the recommendation of a rough skin and being free from eyeholes. Several had been boiled, and they appeared all that could be wished in a Potato."—The same paper of Oct. 1st says, "That important desideratum, a Potato free from disease, has been raised by Mr. Dean, near Burnley." Mr. Glenny, in the "Gardeners' Almanack" for 1854, says "We ought to mention a capital and very handsome new sort of Potato, Dean's Seedling, handsome and well flavoured, and moreover an excellent boiler." Mr. Edwards, secretary to the National Floricultural Society, in a private letter, says Dean's Potato is a perfect gem.

A. STANSFIELD will commence sending out the above Potato the second week in February, at 7s. per stone of 14 lbs., sacks and bags included. Early orders are respectfully solicited, as the stock is very limited. Post Office Orders or reference are requested from unknown correspondents.

A. S. can also supply the genuine Fluke Potato, at 9s. per bushel of 56 lbs., sacks and bags included.

Vale Gardens Todmorden, Lancashire.

CORN MARKET, WISBEACH, CAMBRIDGESHIRE.

CHARLES SHARPE begs to call the attention of the nobility, gentry, and trade to the undermentioned choice collection of SEED POTATOES, grown with great care upon marsh land near the sea, which is the most appropriate soil for the culture of the Potato, as it is less affected by the disease, and of finer quality. The undermentioned prices include hampers and package. Smaller quantities can be had if required. The Trade Price can be had on application.

POTATOES (For Forcing and Early-Planting).

Per bushel of 4 stones.		Per bushel of 4 stones.

Forty Fold	10s.		

THE CHAMPION PEACH.

THOMAS HUTCHINGS, Nurseryman, &c. Axminster, is now sending out this beautiful Seedling Peach, which far surpasses everything of the kind ever offered to the Public, measuring the extraordinary size of from 11 to 13, and sometimes 14 inches—flesh free, rich, and juicy; flavour unequalled—somewhat resembling the Green-gage Plum—an excellent bearer—and in every respect of first-rate quality.

Trained Trees ..... £1 1s. 0d.
Maiden ditto ..... 0 10s. 6d.

It is respectfully requested that all orders from unknown correspondents be accompanied by a Post-office order, payable at Axminster, Devon.

TESTIMONIAL.

"Sir,—I have fruited the Champion Peach, and have proved it to be *quite equal* to the description, and well worthy the name given it. I am ready to answer any inquiry that any lady or gentleman may wish to make.—I am, Sir, yours respectfully,

"JOHN REYNOLDS,

"To Mr. Hutchings. "Belmont, Lyme Regis, Dorset."

Orders received at the Nursery, or by Messrs. Hurst and MacMullen, C, Leadenhall-street, London; and by Messrs. Garaway, Mayes, and Co., Durdham Down Nurseries, Bristol.

February, 1854.

NEW SEEDS—GROWTH OF 1853.

RENDLE'S COLLECTION OF GARDEN SEEDS FOR ONE YEAR, *will be sent out as usual by the Subscribers.*

The collections have given universal satisfaction, and they will be found sufficient to supply a garden during the whole of the 12 *months.*

	£	s.	d.

WILLIAM E. RENDLE & Co., Seed Merchants,
ESTABLISHED 1786. Plymouth.

The quantities contained in the above Collections will be found in our PRICE CURRENT AND GARDEN DIRECTORY, *just published.*

SUTTON'S FINE LAWN GRASS SEEDS for improving Old, or making New, Lawns. The following is an extract of a letter received from Dr. LINDLEY:—

"Messrs. Sutton.—We have already made a trial of your Lawn Grass Seeds, and it is but justice to say they have proved the best we have sown for many years. (Signed) JOHN LINDLEY.

"Horticultural Society, 21, Regent Street, London, Nov. 9, 1853."

Messrs. SUTTON are continually receiving similar letters of commendation of their Lawn Grass Seeds. Price of seed, 1s. 3d. per lb., 3s. per gallon, or 21s. per bushel, CARRIAGE FREE, except very small quantities. The quantity required is 40 lbs. per acre, in forming new lawns, or from 10 to 20 lbs. per acre for improving old lawns.—JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

COLE'S SUPERB CRYSTAL WHITE CELERY.

J. THORNLEY, W. COLE, AND Co., NURSERYMEN, SEEDSMEN, and FLORISTS, Withington, Manchester, beg to announce that they are now prepared to supply this fine Celery at 1s. 6d. per half-ounce packet, or in larger quantities. This variety has given universal satisfaction, and has been proved to possess all the good qualities attributed to it by W. Cole last season. It can also be procured from the following agents:—

Messrs. Hurst and M'Mullen, 6, Leadenhall Street; Messrs. Noble, Cooper, and Bolton, 152, Fleet Street; Messrs. Minier & Co., 60, Strand; Messrs. Charlwood & Cumming, Covent Garden; Mr. Turner, Slough; Mr. Duncan Hairs, St. Martin's Lane; Mr. Denyer, Gracechurch Street; Mr. J. Fairbairn, Clapham; Messrs. A. Henderson & Co., Pine Apple Place; Messrs. Downie and Laird, Edinburgh; Messrs. F. & A. Dickson, Chester; Messrs. F. & A. Dickson, Manchester; Messrs. J. & J. Fraser, Lea Bridge, Essex; Messrs. Little and Ballantyne, Carlisle; Messrs. Veitch & Son, Exeter; Mr. J. Veitch, Exotic Nursery, Chelsea; Mr. Clarke, King Street, Covent Garden; Messrs. Finney & Co., Gateshead; Mr. A. Pontey, Plymouth; Mr. E. Rendle, Plymouth; Mr. Cattell, Westerham, Kent; Mr. Smith, Riverhead, Kent; Mr. Epps, Ashford and Maidstone, Kent; Messrs. Lucombe, Pince, & Co., Exeter; Mr. Browne, Norwich; J. Cole, Keyfield Nursery, St. Albans; Garaway & Mayes, Bristol; Drummond & Son, Stirling.

All orders to be addressed as above, instead of to "Dartford" as heretofore.

KNAP HILL NURSERY, WOKING, SURREY.

WATERER AND GODFREY, Nephews and Successors to the late HOSEA WATERER, respectfully invite the attention of parties engaged in planting to the following list:—

Araucaria imbricata, 2, 3, 4, 5, and 6 feet high, in the open quarters, regularly removed every year, and as robust and handsome as it is possible to get them. We have a large stock.

Cryptomeria japonica, 2, 3, 4, 5, 6, to 8 feet.

Cedrus Deodara, stout handsome plants from seed, in any quantity, and of all heights from 1 to 7 feet. A few splendid specimens 10 to 15 feet; warranted to transplant with perfect safety.

Cedar of Lebanon, 2, 3, 4, 5, 6, 7 to 10 feet. These large Cedars of Lebanon are also very handsome trees.

Cupressus macrocarpa, or Lambertiana, 2, 3, 4, 5, 6, and 8 feet, all from seed.
" Goveniana, 2 to 3 and 4 feet.
" Funebris, 2 and 3 feet.
" thyoides variegata, 2, 3, and 4 feet.

The Variegated White Cedar, a scarce but most beautiful variegated plant, seldom seen except at Elvaston Castle. We hold a large quantity.

Juniperus Bedfordiana, fine plants, 3, 4, and 5 feet.
" Chinese, 2, 3, 4, 5, 6, 8, and 10 feet.
" repandus, 3, 4, 5, to 8 feet.
" Upright Irish, 3, 4, 5, 6, 7, and 8 feet; perfect columns.
" and, except at Elvastou, unequalled.
" Virginiana, the Red Cedar, 4, 5, 6, and 8 feet.

Taxodium sempervirens, 2, 3, 4, 5, and 7 feet.

Yew, common, 3, 4, 5, to 8 feet high.
" Irish, 3, 4, 5, to 10 feet. A splendid lot, all being trimmed to one stem; it adds much to their appearance and value.
" Gold striped, 1, 2, and 3 feet.
" do. worked on the Common, with fine heads,
" 4, 5, 6, and 7 feet high; very handsome.
" elegantissima (new striped) standards. The golden Yews are very ornamental, and we have a large quantity of fine plants.
" Dovaston, or Weeping Yew, fine standards.

Pinus Douglasi, 3, 4, 5 and 7 feet; a few magnificent plants, 10 to 12 feet high.
" insignis, 2, 3, 4, 5, 6, and 7 feet; all from seed.
" cembra, 3, 4, to 6 feet.
" Canadensis (Hemlock Spruce), 3, 4, and 6 feet.
" morinda, 3, 4, and 6 feet.
" Menziesii, 3, 4, 6, and 8 feet.
" cephalonica, 3 to 4 feet.
" Pinsapo, large and handsome, 3 and 4 feet.
" Nordmaniana, from seed, 1½ foot; a few larger, 2 feet.
" nobilis, stout plants, with perfect heads, about 1½ foot; a few larger specimens, 3 and 4 feet. We hold a fine stock of this beautiful Fir, none of which are grafted.

Thuja Arbor-vitæ, American, 3 to 6 feet. We recommend this plant for hedges.
" Wareana, 3 to 6 feet, one of the few really hardy and most useful evergreens.
" aurea. This is perhaps one of the prettiest plants of the day; it was first sent out from this Nursery, and our stock, for size and beauty, is unsurpassed.

Libocedrus chilensis, 1½, 2, and 3 feet. This is a very distinct and beautiful plant, of recent introduction. Our stock is large and good.

Independent of the foregoing we are very large holders of the most useful Evergreens, Deciduous and Ornamental Trees, and of large size. Priced Catalogues will be forwarded on application, enclosing two postage stamps, which will also include a Descriptive Priced Catalogue of the celebrated collection of American Plants grown at this Nursery.

The Nursery is near the Woking Station, and about an hour's ride from London. A visit is earnestly solicited from all who intend planting during the forthcoming season.

POLYANTHUS SEED.

TO THE LOVERS OF THAT BEAUTIFUL EARLY SPRING PLANT, THE POLYANTHUS.

JAMES WOODS has again to offer a quantity of POLYANTHUS SEED, which he has this year saved with more than ordinary care, from about 80 named and good laced flowers, which he can recommend with confidence; with directions for sowing. Price 1*s.* per packet, or sent free on receipt of 13 postage stamps. J. W. has a quantity of RANUNCULUSES, good old superfine named sorts, in one general mixture, which he will send free by post at 4*s.* per 100, or 35*s.* per 1000, on receipt of Post Office Order or postage stamps, to JAMES WOODS, Florist, Harwich, Essex.

P.S.—Plants of Polyanthus will be sent out in April at exceedingly low prices, with blooms on each plant, as the stock must be reduced, the land being wanted for railroad purposes.

SEED TRADE AND OTHERS.

W. J. EPPS begs to offer the following SEEDS, received direct from the Growers. Excellent samples and prices sent on application.

PEAS.

Early Emperor (very true)	Scimetars (true)
Champion of England	British Queen

KNIGHT, Florist, 53, High Street, Battle, Sussex.

SUPERB LATE WHITE BROCCOLI—"EMPEROR."

EDMUND PHILIP DIXON having purchased the entire stock of the above Broccoli of Messrs. Elletson, Market Gardeners, Thorngumbald, near Hull, begs to announce that he is prepared to send it out in sealed packets at 2*s.* 6*d.* each. This Broccoli has been raised by the Messrs. Elletsons, the raisers of the Mammoth, sent out some time ago, who state that the EMPEROR, if sown at the same time, will come into use before it. Is of very dwarf growth, perfectly hardy, with heads from 15 lbs. to 20 lbs. weight; keeps its colour, and stands firm three weeks after it is ready to cut. A noble flower and commands the best price of any other in the Hull market, where it is well known, and will be a great acquisition to the market gardeners around London, as well as those who wish for a first-rate Broccoli.

May be had of Messrs. NOBLE, COOPER, & BOLTON, 152, Fleet Street; and Messrs. HURST & M'MULLEN, 6, Leadenhall Street, London. Also of the Advertiser, 57, Queen Street, Hull.

PEAS! PEAS! THE BEST VARIETY IN CULTIVATION.

CHAMPION OF ENGLAND, a blue wrinkled Pea, very productive, of quick growth, and of a most delicious flavour. This extraordinary Pea combines in one the merits of all others, and has none of their demerits; for, although a wrinkled Pea, it is both hardy and early, and being of quick growth, it is the best kind to plant throughout the season for each crop. It is highly productive, bearing very long pods of a lively green, which are well filled, and the Peas are generally as large as small horse Beans, of a deep green colour, and beyond all others of a most delicious flavour. Height, 3 ft. to 3½ ft.

Price, in quantities of not less than 1 peck ... Bag included 6*s.*
" " " 1 bushel ... ... " 16*s.*
" " " 1 sack (4 bushels) " 60*s.*
" " " 8 bushels (1 qr.) " 106*s.*

Delivered, freight paid by Railway to London.

Orders, with remittance or satisfactory reference, will have immediate attention on application to

H. AND A. WALLIS, SEEDSMEN, Ipswich.

JOHN CATTELL begs to say that the following priced Catalogues of his Nursery Stock and Seeds may be had on prepaid application, by enclosing a penny stamp for each.

Roses, Fruit Trees, Forest Trees, including Quick, Privet, Briar, Holly, &c., suitable for hedges; Hardy Ornamental Trees and Shrubs, including Coniferæ, American Plants, Climbers, &c. Kitchen Garden Seeds. Flower Seeds, in which are enumerated very superior selections of German Stocks, Asters, &c., genuine as imported, in large or small packets, to suit all purchasers.

The following selections are exceedingly fine:—Cedar of Lebanon, from 2 to 8 feet, splendid upright plants, in first-rate order for removal. Cedrus deodara, fine, from 1 to 8 feet. Azaleas, Ghent and English, of the most showy varieties, loaded with bloom buds. Rhododendrons, of all the leading sorts. Kalmia latifolia, in variety, very fine. Andromeda floribunda, splendid plants. Roses, the standards are particularly straight strong stems, also some extra tall stems from 5 to 6 feet, worked with climbing and other showy sorts; the dwarfs are also fine strong plants. Fruit Trees, consisting of the leading varieties, fine and in good order.—Westerham, Feb. 18, 1854.

JUDSON'S RICHMOND VILLA BLACK HAMBURGH VINE.

ARTHUR HENDERSON AND CO. have the pleasure of informing their patrons and friends that they have good plants of this valuable and much-esteemed Vine at 5*s.* each; extra strong plants, 7*s.* each.—N.B. For full particulars of the distinguishing characteristics of this Vine, we beg to refer our customers to the *Gardeners' Chronicle* of October 25th, 1851.

GIANT SAINTFOIN.—*The true Giant Saintfoin may be had genuine of the undersigned, at* 12*s. per bushel, or cheaper in large quantities.*

For particulars, address JOHN SUTTON & SONS, SEED GROWERS, Reading, Berks.

THE LAST ADVERTISEMENT this Season of Cheap and Select NURSERY STOCK.—The Subscribers beg to offer the following choice Stock at the annexed very low prices. Goods from their extensive Nurseries have given great satisfaction throughout the kingdom for many years.

12 best Ghent and other hardy Azaleas, 2 feet, very bushy, covered with flower-buds	£0	18	0
12 Abies Morinda, 3 to 4 feet, very fine plants	1	0	0
12 Pinus Cembra, 3 to 4 feet, fine specimens	1	10	0
12 Pinus excelsa, 3 feet do. do.	1	0	0
12 Standard Cratægus or fancy Thorns	0	6	0
12 Handsome Rhododendrons, 2 to 3 feet, all colours, selected from above 100 kinds...	1	0	0
100 Rhododendron campanulatum, very bushy, 1 foot high	4	0	0
100 Flowering and Evergreen Shrubs, two of a sort ...	1	0	0
100 Splendid and very showy Hollyhocks, flowering plants, grown from Chater's seed	1	0	0
50 Standard Roses, splendid prize varieties, with good heads and 3½ feet stems...	3	0	0
Grafted English Elms, Limes, Oaks, and other park trees; prices on application.			
Large Yews, Laurels, Hollies, Mahonias, and Privets, for game coverts or hedges; prices on application.			
FRUIT TREES.—Per dozen.			
Apples and Pears of the most approved kinds, good strong standards	0	9	0
Ditto ditto, dwarfs, 8*s.*; trained	1	10	0
Cherries and Plums, good strong standards	0	12	0
Ditto ditto, dwarf, 9*s.*; trained	1	16	0
Apricots, Peaches, and Nectarines, trained, of the most approved kinds	2	8	0

WILLIAM JACKSON AND CO., Bedale, Yorkshire.

IMPORTED GERMAN FLOWER SEEDS.—

	s.	*d.*
QUILLED DOUBLE GERMAN ASTER.—Assortment of 24 splendid varieties, containing of each colour 100 seeds	5	0
Ditto, 12 splendid varieties	2	6
DWARF DOUBLE GERMAN ASTER.—Assortment of 16 most splendid varieties, of each colour 100 seeds ...	3	6
Ditto, 12 splendid varieties	2	6
DWARF GERMAN STOCK.—Assortment of 36 most splendid varieties, each colour separate	7	6
Ditto, 24 ditto ditto	5	0
Ditto, 12 ditto ditto	2	6
NEW LARGEST FLOWERING DWARF TEN-WEEKS' STOCK.—This new acquisition has been greatly admired. The flowers are exceedingly large. The colours are rose, purple, blue, light blue, and white, per packet ...	1	0
DWARF GERMAN WALLFLOWER-LEAVED TEN-WEEK STOCK.—Assortment of 12 splendid varieties, containing of each variety 100 seeds	3	0
BRANCHING GERMAN TEN-WEEK STOCK.—Assortment of 12 varieties, containing of each variety 100 seeds	3	0
NEW ROSE PURPLE EMPEROR STOCK, per packet	1	0
WALLFLOWERS.—Collection of eight splendid varieties	3	0
DWARF DOUBLE LARKSPUR.—Collection of 10 most splendid varieties, containing of each colour one-eighth of an ounce	5	0
TALL DOUBLE LARKSPUR.—Collection of 8 splendid varieties, containing of each colour one-eighth of an ounce	3	6
ZINNIA ELEGANS.—Collection of 6 beautiful varieties	2	6

We can strongly recommend the above as being of first-rate quality. They will be forwarded postage free.

J. C. WHEELER AND SON, GLOUCESTER.

EDWARD GEORGE HENDERSON AND SON beg to inform their Patrons and the Public that their Catalogue of Seeds for 1854 is now ready, and will be forwarded post free on application.

E. G. H. & SON take this opportunity of stating that none but the most popular and improved kinds of Vegetable Seeds appear in their List; and among the Flower Seeds only those whose beauty and merit are universally acknowledged, together with a carefully selected stock of the principal new varieties.

E. G. H. & SON beg respectfully to call particular attention to the following choice Seeds of Florist Flowers, which have been saved from a fine collection of named sorts, and also the annexed new Annuals, which they can confidently recommend.

CHOICE FLORIST FLOWERS.

	Per packet.—*s.*	*d.*		Per packet.—*s.*	*d.*
Antirrhinum, fine mixed	0	4	Hollyhocks	1	0
Balsam, Camellia-flowered	0	6	Pansy	1	6
Calceolaria ... 2*s.* 6*d.* and	5	0	Petunia	1	0
Cineraria ... 1*s.* 6*d.* and	2	6	Pinks	1	6
Dahlias	1	0	Verbenas	1	0
Geranium, fancy, 2*s.* 6*d.* &	5	0	Mimulus, beautifully spotted		6

NEW AND OTHER CHOICE FLOWERS.

	Per packet.—*s.*	*d.*		Per packet.—*s*	*d*
Abronia umbellata ...	1	6	Lobelia racemosa (large blue)	0	4
Anagallis azurea grandiflora	1	0	" " alba (new)	0	6
" rubra	1	0	Mignonette (new large-flowering)	0	3
Arctotis breviscapa ...	0	6	" Tree	1	0
Aster, new dwarf German Pyramidal, in packets of 12 distinct colours, separate	6	0	Nycterinia capensis (new)	1	0
" French Pæony-flowered Pyramidal, in packets of 8 distinct colours, separate ...	3	6	" selaginoides (new)	1	0
Balsam, new pale yellow	1	0	" villosa (new) ...	1	0
Collinsia bicolor atrorubens (new)	0	6	Nolana grandiflora alba...	0	4
" Bartsiæfolia... ...	0	4	Œnothera prostrata (for bedding)	0	4
Clintonia pulchella ...	0	6	Portulacca, new orange (not aurea)	0	6
" " alba ...	0	6	" rosea	0	6
" " atropurpurea (new)	1	0	Primula sinensis fimbriata alba	2	6
Coreopsis coronata ...	0	4	" " " rubra	2	6
" Pygmæa (new) ...	0	4	Rhodanthe Manglesi ...	0	6
Eucnidia Bartonioides ...	0	6	Schizanthus Grahami carnea (new)	0	6
Erysimum Arkansanum...	1	0	" retusa	0	4
Grammanthes gentianoides	0	6	" " alba ...	0	4
" " lutea ...	0	6	Stock, Scarlet Intermediate	0	6
" " variegata	0	6	" Pyramidal Wall-leaved	0	6
Humea elegans	0	6	" new dwarf German, in collections, extra fine ... 2*s.* 6*d.* and	3	6
Leptosiphon luteum (new)	1	6	Tropæolum Triomph de Gand	0	6
Linum grandiflorum rubrum (new)	1	6	Digitalis, new spotted varieties, extra fine ...	0	6
Maurandya elegans superba	0	6			

Wellington Nursery, St. John's Wood, London, Feb. 18.

IMPROVEMENT OF GRASS LANDS.

SUTTON'S RENOVATING GRASS SEEDS FOR IMPROVING OLD PASTURES.—Many old Pastures, Parks, and Meadows are nearly destitute of Clovers and the finer and more nutritious sorts of Grasses, in which case we are in the practice of furnishing such sorts only as are wanting. If the Seeds are sown early in the season, the improvement in the Pasture will be very considerable, and at a small expense.

The following is similar to many other letters received from former purchasers :—

From D. T. Cunynghame, Esq., Wellesbourne, Warwick, Nov. 1852.

"The meadows that were renovated with your Seeds are looking very well. I cut nearly 2 tons of hay to the acre, and three years ago the same land hardly produced half a ton per acre. The Garden Seeds I have had from you exceed by far any that I have bought elsewhere."

Quantity of Seed required, 8 *lbs. to* 12 *lbs. per acre. Price* 1*s. per lb.*, Carriage Free.

All orders executed in rotation, in strict accordance with priority of our receiving the same.—Address,

JOHN SUTTON & SONS, Seed Growers, Reading, Berks.

N.B.—We have a very fine Stock of Mangold Wurzel and Carrot Seed, and other Agricultural Seeds.

SEEDS—CARRIAGE FREE.

WILLIAM E. RENDLE AND CO. *have, from the very extensive patronage they have received, been induced this season to offer the following liberal arrangement to all who purchase Seeds from their establishment.*

ALL ORDERS ABOVE £5 WILL BE DELIVERED CARRIAGE FREE TO ANY RAILWAY STATION IN ENGLAND OR WALES, AND TO ANY STEAM PORT IN ENGLAND, WALES, IRELAND, OR SCOTLAND.

Two or three purchasers joining together will therefore have the advantage of having their orders delivered free of any cost for carriage.

RENDLE'S PRICE CURRENT FOR 1854 should be obtained by all who have gardens, or who take an interest in the cultivation of the soil.

CUCUMBERS, MELONS, &c., the best varieties in Cultivation:—

CUCUMBER SEED—Captivation, 2*s.* 6*d.* per packet; Phenomenon, 2*s.* 6*d.*; Victory of Bath, 1*s.*; Lord Keynon's Favourite, winter Cucumber, 2*s.* 6*d.*; Gordon's White Spine, 1*s.*; Chamberlain's Essex Hero, 2*s.*; Sunderlandwick, 2*s.*; Hunter's Prolific, 1*s.*; and numerous others at 1*s.* per packet.

MELON SEED, at 1*s.* per packet—Incomparable, Bromham Hall, Golden Ball, Queen, Bowood, Victory of Bath, Camerton Court, Beechwood, Windsor Prize, Emperor, Fleming's Trentham Hybrid, Hampton Court, Blackhall's Green Flesh, Bailey's, and numerous others at 1*s.* per packet.

A packet of each of the first-named Cucumbers, and two packets of either of the Melons named, sent free for 60 stamps.

SUPERB HOLLYHOCK SEED, 2*s.* 6*d.* per packet.—GERMAN ASTER SEED (very fine and double), 1*s.* per packet.—ANTIRRHINUM SEED (splendid), 1*s.* per packet.—For further particulars respecting the before-mentioned Seeds see this Paper of the 21st ult.

A remittance must accompany every order by cash, or penny postage stamps, when the whole or any part of the above will be sent immediately, postage and package free.

EDWARD TILEY, NURSERYMAN, SEEDSMAN, & FLORIST, 14, Abbey Church Yard, Bath.

The Gardeners' Chronicle.

SATURDAY, FEBRUARY 18, 1854.

MEETINGS FOR THE ENSUING WEEK.

MONDAY,	February	20	Chemical	8 P.M.
			Statistical	8 P.M.
			British Architects	8 P.M.
			Horticultural	2 P.M.
TUESDAY,	—	21	Linnean	8 P.M.
			Pathological	8 P.M.
			Civil Engineers	8 P.M.
WEDNESDAY,	—	22	Society of Arts	8 P.M.
			Geological	8 P.M.
			Numismatic	7 P.M.
THURSDAY,	—	23	Antiquarian	8 P.M.
			Royal	8½ P.M.
FRIDAY,	—	24	Philological	8 P.M.
			Royal Institution	8½ P.M.
SATURDAY,	—	25	Royal Botanic	3½ P.M.
			Medical	8 P.M.

THAT system of holding great public meetings for the purpose of EXHIBITING HORTICULTURAL PRODUCE, which originated more than 30 years ago with the Horticultural Society of London, after crossing the Atlantic, and spreading through all the more civilised Continental States, has at length reached Russia. It appears that in the year 1850 the first meeting in that country was held at St. Petersburgh by the Imperial Economical Society, under the presidency of the Prince Duke of OLDENBURG and Prince BASIL DOLGOROUKY, on which occasion prizes were distributed to the amount of something more than 10,000 roubles (1600*l.*) Since that time these assemblages seem to have become fashionable, for we hear of one at Tiflis formed by Prince WORONZOFF; and of another at Moscow, in 1853. an account has been given by M. MASSON, from whose report we collect the following interesting facts.

The exhibition in question lasted for a fortnight; on every alternate day it was opened gratuitously, on the others admission was obtained by payment: Each free day witnessed the presence of from 30,000 to 35,000 visitors. The place in which the meeting was held was the Government riding school, a building some hundred yards long. The objects of exhibition were so disposed in the interior that the visitors were able to enter at one door and depart at another, inspecting everything in their passage without ever passing twice over the same ground. The exhibition was classified by the inspector of the Imperial Agricultural School, and each separate division was placed in the charge of one of the pupils of the school.

Two parallel rows of tables extended from end to end of the building, and were occupied by what may be called industrial produce. In the centre was placed a collection of agricultural implements, exhibiting the most rude and primitive by the side of

machines of the newest and most improved construction.

In the middle of the whole stood a "monumental clock" which indicated at the same moment the hour of the day at each of the four extreme points of the vast Russian empire. This *chef d'œuvre* of clockwork was embosomed in a rich collection of exotics of various kinds, skilfully grouped and furnished by M. Fintelmann, one of the principal horticulturists of Moscow. Adjoining the mass thus produced stood groups of plants from all countries, cleverly set off with Dahlias in pots. Among them were some extraordinary specimens of Strelitzias, Dracænas, Pandanus, Musa, &c., together with finely grown Orange trees, and a Sweet Bay with a single clean stem supporting a head 8 yards round. "Never," says M. Masson, "in all my travels did I behold such a magnificent specimen as this."

At the four angles of the central square, which was filled with ornamental plants, were placed four large gilt frames, each enclosing about 8 square yards of space. Two of the frames contained, arranged with great taste, the most remarkable specimens of kitchen garden produce then in season; the two other frames were in like manner filled with very fine collections of fruit. Among these fruits were magnificent specimens of the beautiful transparent Apples of the Crimea, and many varieties of Pears, the size of which was surprising when it is considered that, in the climate of Moscow, the Pear tree is a greenhouse plant. These exhibitions of fruits and vegetables were the admiration of everybody; and the plan, M. Masson thinks, might be advantageously introduced into France. That they were really arranged with great taste we can readily believe, when we call to mind the skill with which the Russian agricultural produce was displayed in our own Great Exhibition in Hyde Park.

The whole exhibition at Moscow was bordered by a line of fruit trees and ornamental plants, such as grow out of doors in France, but must be cased up in a Muscovite winter. Among them were Plum, Pear, and Cherry trees pruned and trained like Orange trees, and most especially Peach and Apricot trees of an extraordinary size for plants whose roots were cramped in wooden boxes. Willows, too, were there of many kinds, clipped into round heads, and a Poplar which M. Masson, whose botany is more rusty than his gardening, calls Populus Blagovroney.

The reporter speaks in high terms of the excellence and variety of Muscovite vegetables, the size and beauty of which he says did honour to the skill of the Russian market gardeners, who do not suffer by comparison with those of Paris. He was particularly struck with the black and white Radishes from the Caucasus, some of which are a full yard long, and unknown in Europe.

Among the cereal grains there was a most interesting variety; and it was curious to compare the tiny Wheat of Archangel with the magnificent corn from Bessarabia. The oleaginous plants included one called Navet de Derbend, the seeds of which yield an extraordinary quantity of oil. Among textile plants were exhibited a *perennial* Hemp, and a wild Siberian Flax.

The forest-tree exhibition was one of high interest Everything was there which the Russian territory grows, *even* the trees of Caucasus, sent, as M. Masson slily hints, by the military Governor of that unconquered country. Each tree seems to have been exhibited in the following manner:—1, its seeds; 2, its timber, carefully polished to bring out what carpenters call the figure; and 3, a dried branch in flower and fruit. Some similar plan was adopted with all the plants belonging to rural economy.

Among miscellaneous matters we find recorded great roots, more than 3 feet long, of the Statice tatarica, used by Tartarian tanners under the name of Kierme, and containing 22 per cent. of its weight of pure tannin; all sorts of objects manufactured out of bark, rushes and straw, among which figured straw head-dresses, and straw boots with leather soles, said to wear very well; and finally preserved fruits, fermented liquors, specimens of earth, both arable and fit for pottery or other purposes, textile materials, wool, and silk, the latter in abundance and of great beauty.

Such is said to have been the great exhibition at Moscow in 1853, from which we English should borrow some useful hints. It is evident that tinsel was not there allowed to displace the more precious metals.

Our correspondent "R. J." (p. 86) appears to have misconstrued the article (p. 70) which suggested forbearance from giving either bread or coals to the needy, but to substitute in lieu some other mode of relieving them. The drift of "B.'s" communication was the prevention of *waste*—waste of the now dear articles bread and coals, as it was affirmed that "both rich and poor are regardless of waste when things are obtained at little or no cost." It was therefore suggested that donations to the poor should not be either dear bread or dear coals, but of some other form. Were the disposition less prevalent to spend money lightly obtained at the alehouse, possibly charity might be most beneficial when given in cash; but, in the existing state of things, this mode might in too many cases be productive of evil, and therefore some such food as hot boiled Rice was suggested as a substitute for bread. It was also observed that as fewer coals are consumed in boiling Rice than in baking bread, coals might thereby be saved; and it was added that "this mention of Rice in particular is intended merely as a hint," since in point of fact there are many other kinds of food, and preparations of it, that would afford more nourishment to the recipient at less cost to the donor. In one important particular "R. J." seems to have altogether mistaken the article he criticises—namely, that it implied the absence of fire in a cottage; should he again take the trouble to read over "B.'s" suggestions, he would find that not a single line of it implies either a cold cottage or cold food, or abstinence from food of a substantial nature—it does not contain any item against "bread and milk," or any other article a cottager's means will afford him, though *hot* boiled Rice was suggested as a substitute for *cold* bread—bread not baked in the cottage, consequently not contributing in anyway to the warmth of it.

Experience has shown that old habits are rarely overcome but by the introduction of new ones; knowledge of other countries has proved that the English cottager is worse fed, though at greater cost, than the peasantry of any other European nation; a collateral benefit to the poor was therefore in view when hot boiled Rice was mentioned, it was that of inducing the humbler classes to feed in times of dearth on unaccustomed articles of food, especially when bestowed gratuitously, and hence to learn, it was hoped, that other things than dry bread are eatable, and that a hearty, nourishing, hot meal may be procured at even less cost than the customary bread, with at most a shaving of cheese to give it relish.

We have thought it worth while to say thus much, in order to prevent misapprehension. At the same time we must observe that if people would but take the trouble to read as well as look at the contents of our columns, they would save trouble to themselves as well as to us and others.

We understand that the meeting of the Horticultural Society on Tuesday next promises to possess unusual interest. In addition to the casual subjects of exhibition the relative quality of Deodar and Cedar of Lebanon timber will be illustrated by specimens from India and from Lebanon itself, in addition to which Messrs. Veitch will produce wood, bark, and cones of Wellingtonia gigantea, together with a portrait of one of the trees, as it appeared, when growing a few months since, in Northern California.

VEGETABLE PATHOLOGY.—No. VII.

13. As plants consist entirely of cells variously modified and matters produced by them, it is evident that in order to obtain correct notions of the effects of disease on vegetable structure, we must first have a clear apprehension of the normal condition and constitution of cellular tissue.

14. The simplest form under which a cell can exist is that of a single membranous closed sac, containing gaseous or fluid matter of different degrees of density, and holding more solid substances in suspension. It is, however, doubtful whether cells of this simple structure exist in vegetables, except in a state of infancy.

15. Every cell in a state of active growth contains one or more minute, hyaline, globose, or subglobose bodies, which either take their origin immediately from the protoplasm, or arise from the division of similar parents. They consist themselves of a delicate sac* containing fluid matter, with one or more distinct nuclei. These bodies are called cytoblasts, and their nuclei seem to be their cytoblasts of the second order. They are sometimes attached to the walls of the cells, but whether attached or free they exercise some very important influence on the production of new cells.

16. When the protoplasm of a cell is about to pass into a state of further division, its matter is concentrated in one or more points of the cell cavity round the cytoblasts, and either a delicate membrane is formed round the concentrated masses, or they are embraced and ultimately surrounded in consequence of division by one already present, and that membrane is known by the name of the primordial membrane.†

* Authorities differ on this point. It is, however, impossible to enter into the comparative merits of contending opinions in a treatise like the present. We must content ourselves with stating what we ourselves believe to be the fact as far as we can collect it from recorded investigations, and our own observation.

† In what follows we are greatly indebted to Schacht's "Treatise on the Cells of Plants," which is an inexhaustible mine both of "old things and new."

17. The primordial membrane still remains the innermost, whatever modifications the cell may afterwards undergo, and so long as it is present or in a condition of health, the cell performs its various functions; but when it has been completely absorbed the protoplasm is replaced by air, and the cell is dead. The primordial membrane, however, is so delicate that it is not always possible to ascertain its presence in every condition, even of healthy cells. Though not, however, visible at once under the microscope, because of its delicacy and close attachment, it often becomes visible on the application of sulphuric acid or other chemical agents, sometimes even of pure water, in consequence of its contraction. It is not dissolved like cellulose by sulphuric acid, and is evidently of a very different chemical nature, probably nitrogenous. In our woodcut No. 1 the younger cell of *Protococcus pluvialis* consists merely of the primordial membrane, showing the cytoblast obscurely in the protoplasm; the more perfect spore is surrounded by cellulose. The second membrane in the asci of fungi appears to be the primordial membrane; at least, in the cases which we have examined it resists the action of sulphuric acid, when the outer cell membrane is dissolved. This second membrane is shown very distinctly in woodcut No. 3, fig. 1. It generally projects beyond the broken edge of the ascus, when torn off from the hymenium.

18. After the formation of the primordial membrane, a second sac external to the first is formed, whether from the surrounding protoplasm or from matter oozing through the primordial sac is doubtful, but surrounding it completely on every side. It is found to consist when perfectly cleansed from all foreign matter, whether adherent or penetrating into its substance of pure cellulose, as appears from the investigations of Payen. It does not, however, always exhibit the peculiar chemical reaction of cellulose *in situ*; in fungi, for instance, it does not in general assume a blue tinge with iodine and sulphuric acid. It is curious, however, that in the asci of some fungi where two membranes are always present, attached at the tip, though neither of the membranes assumes a blue tint under the application of iodine and sulphuric acid, which they ought to do if composed of pure cellulose, a shade of blue exists at the very point of attachment, where the protoplasm of the new cell is covered by the already existant primordial membrane; the original cell wall follows the same course, and there is no new formation either of cellulose or primordial membrane, but merely a deduplication of both. At least such appears to be usually the case.*

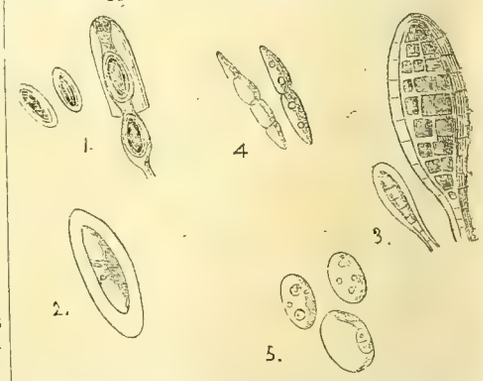

Fig. 1. Ascus and sporidia of *Sphæria pedunculata*, treated with iodine and sulphuric acid. The external membrane remains nearly colourless. The internal or primordial membrane being filled with protoplasm becomes yellow, but at the point of junction of the two membranes the tint is blue. The external gelatinous coat resists sulphuric acid and remains colourless when treated as above.

Fig. 2 Sporidium of *Sphæria siparia*, quite young, with a thick gelatinous coat, and the protoplasm bipartite previous to the first division of the cell.

Fig. 3. Spores of *Hendersonia polycystis*, the larger one showing the annulate outer gelatinous coat.

Fig. 4. Sporidia of *Sphæria macrotricha*, one containing two cytoblasts in either cell, the other with four perfect cells, of which the cytoblasts were the precursors.

Fig. 5. Cells from the embryo sac of *Cynoglossum officinale*, after Schacht, showing different states of the cytoblasts.

19. In the sporidia of many fungi there is a distinct gelatinous coat of greater or less thickness external to the second sac. This is not, however, always persistent, and is probably analogous to the intercellular matter which binds the cells of many plants together, and which sometimes gorges the intercellular passages. This coat is generally absorbed at a later stage of growth, and cannot be considered as entering into the constitution of the cell. Good examples are shown in the foregoing woodcut at figures 2, 3. In some cases of compound spores, as in *Hendersonia polycystis*, fig. 3, the gelatinous coat is divided annularly, conformably to the primary divisions of the spore.†

20. Between the primordial membrane and the outer cell wall numerous strata of fresh matter are frequently deposited, exactly lining the outer cell and exhibiting all its peculiarities of form. This new lining does not consist of pure cellulose, but is often more or less impreg-

* Mr. Henfrey, however, considers the cell-membrane of the new cell even here as secreted by the primordial membrane. That the cellulose of such cells as are produced in the bosom of the protoplasm is secreted by the primordial membrane or deposited from the protoplasm under its peculiar influence has been already stated. See "Annals of Nat. Hist.," Vol. XVIII. p. 364.

† The epispore of the sporidia in Truffles is truly cellular, but in the spores described above the gelatinous coat is probably merely divided into distinct compartments.

nated with nitrogenous matter, or exhibits ternary combinations different from those of cellulose as xylogen. It is in consequence of these new and repeated layers that the ligneous cells acquire their strength and firmness, and from the same cause bony consistence arises in the gritty cells of Pears and in many capsules and galls. *M. J. B.*

CLIANTHUS PUNICEUS.

If hardiness of constitution, easy culture, and brilliant flowers, which remain long in beauty, are recommendations to a plant, then this fine old shrub deserves to be more generally cultivated than it is. It may easily be had in bloom shortly after Christmas, and if placed in a favourable position in the conservatory it will retain its beauty for some two months, and its large crimson flowers contrast well with those of most plants which blossom at that season. In choosing cuttings, select short-jointed pieces of the young wood in a half ripe state, plant them in sandy peaty soil and cover them with a bell glass. Place the pots for a few weeks in a temperature a little higher than that in which the cuttings have been grown; afterwards plunge in a gentle bottom heat of 75° or 80°, when roots will speedily be emitted, if watering and shading from bright sunshine are properly attended to. Pot singly in 5-inch pots, as soon as the cuttings are sufficiently rooted to bear handling, and place them in a close moist situation until they get established, which, with ordinary care, will soon be the case, and the young plants should be removed to a cooler situation as soon as they have got hold of the soil. The plant delights in a cool moist atmosphere during the summer months, and will be found to do exceedingly well in a cold frame, placed where it will be shaded from the midday sun, and which can be kept rather close and moist, and the young plants should be removed to some such situation as soon as they are fairly rooted, for if kept in a warm house they will soon be infested with red spider, and they never make strong vigorous growth in a high temperature. Give a liberal shift as soon as the pots are found to be well filled with roots, which, in the case of cuttings rooted early in spring, will be by the beginning of June. Stop any over-luxuriant shoots, and keep them tied out and rather thin, until a bushy habit of growth is obtained. During summer the plants will require a liberal supply of water at the root, and should be moistened overhead morning and evening in bright weather, and if red spider makes its appearance lose no time in eradicating it. It will be beneficial to the young plants to place them in a shady situation out of doors, towards the middle or end of August, to ripen their growth. On the occurrence of cold wet weather, or frosty nights, remove them to a cool airy part of the greenhouse, and keep them rather sparingly supplied with water during winter. Towards March they may be more liberally watered to induce them to start into growth, and when growth has commenced give a moderate shift. The plants should be afforded a sheltered position in the plant-ground, to which they may be removed as early as the weather will admit, and when the pots are found to be full of roots give another shift, and if all has gone on well this may be into 15-inch pots, in which they will form handsome specimens. If the plants are wanted to flower early keep them rather sparingly supplied with water after about the middle of August, which will check the growth and ripen the wood; and if they can be placed in a close part of the greenhouse when it becomes necessary to remove them in-doors, they will soon show bloom, and with a very little artificial heat will be in flower shortly after Christmas. After blooming the shoots should be cut back, thinning out any weakly ones, and the plants placed where they will receive plenty of light and air, and be safe from frost, treating them in summer as recommended for last season, shifting into 18-inch pots if convenient. The Clianthus will thrive in rich free soil, which may be composed of about equal portions of good firm turfy loam, leaf soil, and fibry peat well intermixed with sharp sand and lumpy bits of charcoal, to ensure perfect drainage. *Alpha.*

ENTOMOLOGY.

RHYNCHITES BETULETI, FAB. (THE BIRCH AND VINE WEEVIL).

The injury which the vineyards sustain from the attacks of insects, especially in the south of Europe, has been long since well known, and their economy ably discussed by various naturalists; and the malady which is now so widely spread over the wine-growing countries, and from which our own crops of Grapes have not escaped, has attracted the public attention, and inclined many persons to regard the state of the Vines, who before had only thought of the quality of the Grapes. The interest thus excited in the south of France, in Piedmont, and Tuscany, led me to look more especially to the Vines last summer, and in some localities it was not possible to find by the end of July a bunch of Grapes that was not mildewed; and I doubt not the entire crops in many parts of Piedmont were entirely lost. When at Genoa, as early as the first week in June, this malady was well established on the Vines in the Botanic Garden there, and a merchant of that city told me the loss of the vintage was becoming so serious that the proprietors were considering if it would not be advisable to grow Hops for beer, to replace the wine.

Whilst in this beautiful garden I was surprised to see numbers of leaves hanging to the Vines or lying on the ground, rolled up precisely like cigars (fig. 1, reduced to half the natural size). These singular objects I found were the work of an insect called Rhynchites Betuleti, which, by defoliating the trees, very materially injures the crop, as the Grapes become stunted and will not ripen. It seems remarkable that the Vines in England, as far as my knowledge extends, never suffer from this weevil, for it frequently occurs in woods and plantations, where it is contented to feed upon the Birch and Alder.

It was early in June when I observed the leaves thus rolled up; they then contained the eggs of the beetle, which I understand are deposited between the cuticles of the leaf. From the female having nearly cut through the pedicel of the leaf before she lays her egg and rolls it up, the leaf dries and becomes the food

required by the maggot, which usually feeds for four or five weeks, but I found one alive at the end of December; this might be owing to its travelling in a box for several months free from damp; for when the leaves are blown off, the maggots bury themselves in the earth.

This maggot is a dull yellowish white, sparingly clothed with short hairs; the head is pitchy black and shining, and behind it is a horny brownish scale; eight of the spiracles were visible, the abdominal segments were divided by deep grooves, and each one was again transversely cut. It curled itself up like most of such fleshy maggots, and it could walk pretty well (fig. 2, the natural size; 3, magnified).

The beautiful beetles produced from the pupæ of these larvæ I have found around London, and in various parts of England, on the Alder in May, and on the Birch in June and July. It is said the first brood appears in France at the end of August; if such be the case, the weevils must either hibernate or there are two broods in a year. They vary in colour from the most splendid green reflecting golden shades to a deep blue. Fig. 4 (the curved line exhibiting the natural length) will render any minute description of the weevil unnecessary, but it must be observed that one sex alone has the spines on the thorax, and that is the female. Most probably they are serviceable to her in rolling up the leaves in the marvellous way which this little creature accomplishes with such dexterity and sagacity.

Amongst the enemies of the Vine-weevil is a very minute Hymenopterous fly, which Prof. Filippi, of Turin, gave me. The female contrives to lay her eggs in those of the weevil, and eventually the Pteromalus * is hatched from the egg; but its economy is so anomalous and remarkable that I must refer the reader to Dr. Filippi's own history of this parasite, which he has discovered.† *Ruricola.*

Home Correspondence.

Deep Soiling Potatoes v. *the Disease.*—The following plan of averting the disease was first brought into notice by a carpenter, who occupies a cottage and small plot of ground on this estate. Being desirous of growing some Celery, and having no ground to spare for that purpose, he determined to plant it between some rows of Potatoes which he expected would prove a failure. To effect this he made a trench between the rows, and turning the tops on either side he cast the soil out of the trench on the top of the Potatoes, without regard to that crop, which at that time was in full vigour. The result was that when the Potatoes were taken up the tubers proved all sound, and that nearly all those which had not been so treated were decayed. This induced him to pursue the same practice the five following years, and the same success has attended his labours. Being a witness of the beneficial results of this mode of culture, I determined to follow the same plan, and I can now say, that after trying it both upon early and late varieties, in the open ground and on warm borders, I am satisfied that the discovery is most important. It is true that the tops suffer to some extent, but the tubers, with scarcely an exception, remain sound. I hope, however, that all gardeners will make a trial of the plan by way of experiment. In my case I left a row or two of each variety on the plot of ground not treated as above, and in every instance a third part of them were unsound, whilst those earthed over in the manner I shall presently describe were all sound, both in the field and garden. When my crops were being taken up, several gentlemen, members of the Royal Agricultural Society of England, and of the Horticultural Society of London, were present, and all were fully satisfied that it is a method to be highly recommended and of easy application. My plan is to plant on open quarters well manured; and, as soon as the tubers are full grown, say the last week in June for early sorts, and the 1st of July for later ones, or just before the blight takes the foliage, to turn the latter on one side, and the rows having been previously well earthed up with the hoe, to dig the soil out from between the drills with a spade, and lay it on the ridge so as to form a deep furrow between each row. Thus circumstanced, the tops continue to grow, and the tubers being now full sized, all remain sound in the ridge of soil. The disease was never worse here than it was last season, which indeed was the case generally throughout Norfolk. *Charles Alborough, gardener to G. S. Kett, Esq., Brooke House, Norwich, Norfolk, Feb.* 20.

Effects of the Winter at Poles, in Hertfordshire.—The following report of the effects of the late severe weather upon my Pinuses may not perhaps prove uninteresting:—Pinus macrophylla, pseudo-strobus, leiophylla, Hartwegi, and longifolia, have all been killed; P. patula has had its points injured, and it is very brown; P. Winchesteriana has been so much injured that it is doubtful if it will recover; P. apulcensis is very brown, as is also nobilis. Abies Brunoniana has had its points injured, and has lost many leaves; Libocedrus chilensis is brown on the south side. The variety of Deodar called viridis is likewise brown, and some of its points have been killed; Cupressus Uhdeana is very much browned on the south side, and many of its points have been killed; C. thurifera is also very brown on the south side; Taxodium sempervirens is brown, and many of the tips of the shoots have been killed; Benthamia fragifera has been killed, Garrya elliptica is greatly injured, the leaves of Quercus macrophylla are very much blotched and injured, as are also those of Arbutus Unedo, Laurustinus, and Portugal Laurels. Acacia prostrata has been killed; it had grown and flowered luxuriantly on a south-east wall for several years. Saxe-Gothæa conspicua and Fitzroya patagonica have stood well, not being injured in the least. *R. Hanbury.* [We shall be glad to receive more reports on this interesting subject; but venture to ask our correspondents to delay their returns till May.]

The Food of Working Men is a matter of very great moment. Errors of regimen will bring on disease as scurvy will bring on debility, incompetence for labour, proneness to disease in general, and short-livedness. The form and fashion may vary, but the working man needs food no less substantial, no less sufficient, than the Prince. I would propose no food for the poor man that I would not live upon, if needs were, myself. That great friend of the poor, Count Rumford, considered that he had made a great discovery, when he concocted ever so many pounds of pudding out of a few pounds of Indian corn, and produced soups flavoured with such ingredients as a bit of salt herring, and the like. Soyer has fallen into much the same error as others have done, in respect of Lentils, Rice, and similar matters. Food for working men must be substantial, varied, sufficient, savoury. If the food prove deficient in but one of these respects, the working man must suffer. It is hardly necessary to prove that workmen, their wives and children, just now, are not, in general, sufficiently well fed. In fact, they are not. In trying, however, to multiply their resources, we must take care not to imitate too closely the good Count Rumford. His intentions were most excellent. The intentions of his followers are excellent; but both Count Rumford and his followers have proposed, and propose dishes quite insufficient, *per se*, for human sustenance. A certain amount of fluid or semi-fluid food, if coupled with sufficient solid food, may be taken with advantage, but not otherwise. Rice or Potatoes, or Pulse, or Legumes, boiled into a mash, alone are insufficient for working men, but prove excellent when stewed with a fair proportion of meat, or are consumed with good sound bread, preferably brown bread some eight-and-forty hours old. The richest animal soups even will not keep men alive unless eaten with good bread. Vegetable soups or stews are equally insufficient; milk alone suffices; but in this case Nature provides for its coagulation and comparative solidification when introduced into the human stomach, to say nothing of the stomachs of the inferior animals. If Rice or other similar material be employed as a soup or pottage to eat with bread—we may prepare it with as much fluid, as soup, or milk, or water, as we please.—but if Rice or other grain be intended as exclusive nourishment, it must be boiled firm, or, as the French term it, *croquant*. The boatmen on the Vistula boil the Wheat, which they eat three times daily, firm. The black tribes in Africa, whom I have witnessed, do the same with their Rice. Thirty minutes in boiling water suffice to prepare Rice fit for exclusive nourishment. A similar remark applies to Potatoes, when exclusively used. My countrymen, as is well known, are in the habit of boiling them with "a bone" in them, the object of which, after the preceding observations, will be obvious. *H. M'Cormac, M.D., Belfast.*

Cost of Erecting Garden Walls.—Allow me to inform Mr. Ayres that a 10 feet 14-inch wall, with good coping and footing, can be built at a much less cost than what he states (see p. 85). He says such a wall cannot be put up under 15*l.* or more per rod; but in 1852 I had built at this place a 14-inch wall 8½ feet above ground, and with 18-inch foundation, with good sandstone coping projecting 4 inches on either side (the workmanship

* Curtis's "Guide to an Arrangement of British Insects," Genus 627.

† Translated and published, I believe, in the "Annals of Natural History."

being of the best description), for 7*l.* 15*s.* per rod. *J. Daniels, Woodside House, Frant, Sussex.*

Orchard Houses. — In Mr. Ayres' article on this subject (see p. 65), reference is made to a house recently erected at this place, and a statement given of its size, the description of material used, and the cost of construction, &c., all of which, however, must be taken with the modification I now supply. Thus, the width of the house is stated to be 17 feet, the exact measurement is only 15 feet; the whole of the glazing bars are of wood, the frame-work of the roof only being metal; the trellis and wall having previously existed in their respective positions formed no part of the expense to which allusion has been made; and that sum is altogether irrespective of the appliances for the supply of air and water on the foundation of the front part of the structure. The trees were planted in the last week of March, 1852, the glazing, however, was not completed until late in the autumn of that year. Vegetables, forcing plants, &c., have been very successfully wintered there these last two seasons, and the borders are now filled with many articles of a culinary nature planted experimentally. The construction of the building is in many respects of a novel character, and I had, in consequence, deferred giving any account of it until its merits had been fully tested, and the value of certain experiments undertaken had been properly ascertained. I purpose, however, shortly to prepare a detailed account of the whole, with a view to its publication in some of the horticultural periodicals. *James Duncan, Basing Park, Feb.* 14.

Green Strawberry Flowers.—I imagine the cause of your correspondent's Strawberry blooms coming green, instead of white, is want of light, and to prove this allow me to state my own case. I have a span-roofed pit, 50 feet long by 11 feet wide, furnished with a stage, and filled with Strawberries; the roof faces south-east and north-west. I filled this pit, in Christmas week, with about 500 pots of Strawberries, one half being Cuthill's Black Prince, the other, Keens' Seedling, together with a few British Queens. The whole of the north-west side was filled with the Black Prince, which is now in full bloom, and most of the flowers, although not absolutely green, have a decidedly greenish tint; while those of the same variety that are facing the south-east are beautifully white, as are also such of the Keens' Seedlings as are in flower; those at the end of the pit, where they get a little of the afternoon sun, are also quite white. I do not think that hard forcing has had any influence in my case, as the maximum temperature in the finest days has never exceeded 65°, and 50° at night. They had no fire-heat for the first fortnight, except to exclude frost, and it was applied very gently for some time after. I have used manure water once a week, but I have given it equally to all, so that green flowers may, I think, be safely attributed to a deficiency of light. *J. B. H. G.*

The late M. Gaudichaud.—Death has of late been very busy amongst the members of the French Academy, and has swept off more than one of their most honoured colleagues; within the last few days they have had to deplore the loss of M. Gaudichaud, after five months of suffering, at the comparatively early age of 64. These sad events, however, are always tempered by the opportunity which they give for the reward of other deserving labourers in the same field; and it is with peculiar pleasure that we announce the election of Monsieur E. R. Tulasne, in the place of the lamented Jussieu, to a post which is the great object of ambition to every follower of science in France. His memoir on the embryogeny of plants, and that on the family of Podostemads, "one of the most remarkable memoirs which science knows, alike valuable for minute observation, and the admirable illustrations which accompany it," would alone have given him claims to admission, but it is in Cryptogamic plants, like one or two of his younger *confrères*—younger, that is, as to order of selection—that he has more especially established for himself a reputation which no change of system nor any advance of science can ever overthrow. His treatises on the tribe of subterranean fungi, on the genus Nidularia, on the family of rusts and mildews, and above all on the male organs or their analogues in Lichens and Fungals, not to mention many others, have involved the lovers of science in a debt which can never be fully paid. High, however, as his scientific attainments confessedly are, these do not form by any means his only recommendations amongst a large circle of friends, by whom he is regarded for many social virtues, but more especially for the firmness and consistency of his religious views, where it requires more courage than many of us can well conceive to exhibit a very slight degree of serious earnestness. Our pleasure at the appointment of M. E. R. Tulasne would, however, be much diminished if we did not hope that the merits of his brother, who from the purest motives has of late retired from all public participation in their joint labours, would some day be openly recognised by the Academy. In all these scientific investigations the two brothers have walked together

——with open heart and hand,
Affectionate and true.

And we trust that their equal merit may sooner or later meet with equal reward. Sure we are, at least, that should this desirable consummation be at length attained, the Academy will boast of no brighter ornaments than this *par nobile fratrum. M. J. B.*

The Barbarossa and other Grapes.—In reply to some remarks of "J. B. W.'s," respecting the Barbarossa Grape being "ominously like a Grape he knew many years ago under the name of Black Muscadel," I would state that he may possibly have had the Barbarossa in cultivation under that name; that I do not question for one moment; but I would ask him can he apply my description of Mr. Warde's Barbarossa to the Black Muscadel of the original authority, "Speechley," No. 8, copied by "Lindley," No. 10; and Mogul of some collections, Lindley. This sort I am well acquainted with, and I here subjoin its description from the last mentioned authority. "The bunches of this Grape contain berries of different shapes and sizes; generally they are large and oval, but some of them are very large and long, somewhat compressed and flat at the ends; skin thin, of a black colour, with a delicate juicy flesh; the leaves change in autumn to a bright scarlet." This is rather brief, but it is a correct description, and cannot be applied to Mr. Warde's Barbarossa, particularly as regards the size and shape of the berries on the same bunch, some of which I have seen swelled out to an immense size, and others the size and shape of an ordinary Black Hamburgh. The Wortley Hall Grape I have never seen; for the origin of this I would refer "J. B. W." to the "Horticult. Society's Transactions," Vol. IV., p. 516, and to "Lindley," No. 40, where he will find it stated that it sprang from seed in the stove at Wortley Hall, in 1819. For the Poonah I must again refer "J. B. W." to an original authority,—"Lindley," No. 29. The explicit description given of it there is correct in every particular; the bunches are handsomely formed; but as regards quality, in comparison with the Barbarossa it is worthless; neither can I identify the Barbarossa with the Black Raisin of "Lindley," No. 13, "Speechley," No. 39; Raisin Grape of "Miller," No. 18; "Gard. Dictionary," 1733. This is a true Raisin, with its large oval berries and hard firm flesh. Mr. Lindley's description of this sort is correct, and will not apply to the Barbarossa; these three sorts, viz., the Poonah, the Black Muscadel, and the Black Raisin, I again assert, are three distinct kinds. They were at Pieton Castle in 1842, but whether they are now there or not I am unable to say. It appears from Mr. Warde's communication that he is himself doubtful whether or not he attached the right name to the variety in question; but it has recently come to my knowledge that when the Vine was planted at Welcombe, he wrote the name Barbarossa under the rafter himself. This I had from more than one witness, of whose veracity I cannot for one moment doubt. And again I am informed that a person who travelled with Mr. Warde in Italy as courier, when he saw it in fruit at Mr. Butcher's, in Stratford, recognised it as the Barbarossa of the parties it was purchased from; but it now appears from the researches of "R. T.," that our Barbarossa is evidently a misnomer; that we have not got the true Barbarossa or Red Beard; but I suppose we must retain Mr. Warde's nomenclature till we get the correct one. It is just possible, owing to the publicity given to the disputed nomenclature of this Grape, that some gentleman travelling through Lombardy and the other Italian states may reintroduce our old acquaintance the Lombardy or Flame-coloured Tokay, or even the Red Syracuse, as the true and veritable Barbarossa or Red Beard, as it is very likely that these two varieties are placed in Count Odart's family or tribe Barbareux—the Lombardy especially, from its gross habits of growth and general appearance of bunch. *Wm. Cooper, Charlecote Park, Stratford-on-Avon, Feb.* 8.

Sikkim Rhododendrons.—I received a few seeds of Rhododendrons from the Himalayas about three years ago, labelled "woolly capsule," and no more. One of these plants has now flowered, and a beautiful thing it is; it has a fine, bold flower, pure white, except one or two petals, which are slightly tinged with pink; and it is as fragrant day and night as the wild Honeysuckle, whose scent it exactly resembles. May I ask what species you imagine it to be? The plant has woolly leaves, and looks like one I have seen, but not in flower, called Edgeworthi. *M. A.* [We presume your Rhododendron to be Edgeworthi; but a mere description does not enable us to speak positively.]

Societies.

Entomological, *Jan.* 23.—This being the Anniversary Meeting the removal of four members from the Council, and the election of four others in their stead, as proposed at the December general meeting, took place; no change being made in the offices of President, Treasurer, and Secretaries. The President delivered an address, for which a vote of thanks was passed, with a request that it should be published.

February 6.—The President in the Chair. Messrs. Staunton, F. Smith, and W. W. Saunders, were appointed by the President to be Vice-Presidents for the ensuing year. The President exhibited specimens of both sexes of a curious new genus of moth, from Brazil, reared by Mr. Bates, the larvæ of which reside in moveable cases like those of Psyche. The female is winged. The name of Saccophora Batesii was proposed for it. Mr. E. L. Layard exhibited his very fine collection of Lepidoptera, from Ceylon, many of which had been reared from the caterpillar state. The numbers of nocturnal species was very great. Mr. J. Curtis read a series of critical remarks upon the nomenclature of the Elateridæ, describing several new British species, and calling attention to their transformations. Mr. S. Stevens also exhibited a new Scottish species of the same family, Elater impressus of Fabricius, taken at Rannoch, in Perthshire, by Messrs. Weaver and Foxcroft; likewise very striking varieties of the two fritillary butterflies, Argynnis euphrosyne and Paphia, taken by Mr. Johnson, near Ipswich. Mr. Douglas exhibited a specimen of Phigalia pilosaria taken as early as the 24th January, late at night, having been attracted to the light of a gas lamp. Mr. Douglas remarked further that he had on former occasions observed moths fall at night flying about lamps where they had not been observed at an earlier period of the night. He likewise stated that, notwithstanding the severity of the season, he had already found the larvæ of Elachistæ mining on the leaves of Grasses. Mr. G. R. Waterhouse directed attention to the new work on the genera of European Coleoptera, of which the publication is announced by M. Jacquelen Duval, and of which specimens were exhibited. He likewise made some observation on the generic identity of two groups of Curculionidæ, which had been termed Cherrus and Polyphrades. It was announced that the Council had extended the time for the receipt of essays in competition for the prizes on the subject of the mussel scale of the Apple, &c., to the 30th of December, 1854, and that they offer a similar prize of 5*l.* for an essay on the natural history of the coccus producing the lac dye of commerce; Dr. Royle having kindly offered to furnish to applicants the information on the subject in possession of the East India Company, and to procure from the resources of the Company in India any further particulars that may be required. The essays to be delivered on or before the 31st December, 1855.

Notices of Books.

Mr. Paul has published a *Supplement to his Rose Garden* (Piper and Co.), with four good coloured figures of Princess Alice (moss), Vivid (hybrid climbing), General Castellane, and Louise Odier. It is introduced by some sensible observations, which Rose buyers would do well to recollect, and from which we select the following passage:—

"A few years ago Rose cultivators seemed to vie with each other in obtaining the greatest number of varieties. This state of things has happily passed away. A new kind is no longer cared for because new, unless it be also superior to, or distinct from, pre-existing kinds. It would be a fortunate thing for themselves and others if the French nurserymen would follow the example thus wisely set them by English florists and amateurs. But it is not so; for during the past year more than 100 new varieties have been sold, at prices varying from 10 to 25 francs each; and with all our fondness for Roses, we cannot find more than 20 kinds worth purchasing for trial; the remainder are similar but inferior to old kinds, thousands of which are sold here yearly at 1*s.* each. One cultivator offers 28 new varieties in one season, and another swells the number by an additional list of 18! The dishonesty of this will be apparent to those who know how difficult it is to obtain one really new and distinct variety; but we fear the practice will continue so long as English gold flows so readily towards those pretty French terms, 'bien gracieuse,' 'admirable,' 'tres belle,' 'magnifique,' 'odeur d'essence de rose,' and the like, and in answer to the ill-principled practice of seizing upon popular English names wherewith to baptise second-rate or indifferent varieties."

The Manetti stock is condemned, experience not confirming its supposed good qualities, unless perhaps for pot Roses. The descriptive catalogue of novelties, forming the principal part of the supplement, is useful and well done.

Pictorial Calendar of the Seasons. Edited by Mary Howitt. H. Bohn, 8vo, pp. 567, upwards of 100 wood engravings.—To all who are fond of the country this volume will be found as attractive as any which has appeared in the present season. Mrs. Howitt's name is a guarantee of its being cleverly put together; we have little fault to find with it on the score of accuracy; and it is profusely illustrated by skilfully executed woodcuts. The plan of the work may be understood from the following account of the manner in which the month of January is treated. This is proverbially the month of frost and snow; the history of their phenomena is given scientifically, and anecdotes are found abundantly to enliven the science. Then wolves are fierce, and an extract from Thomson's Seasons explains their habits. Foxes prowl about, and a clever moonlight country scene, with Reynard watching a hen-roost, varies the monotony of letter-press. A capital cut of boats swamped in a river by broken ice illustrates the effects of this formidable agent, whose singular action is explained familiarly, yet with philosophical precision. In another page the origin of the word January, and why it was derived from the double-faced Janus, is given historically; and further on we find accounts of New Year's merry-making, Epiphany, St. Distaff's day, Plough Monday, and St. Agnes's day (who, Mrs. Howitt says, ought to be called Hagnes) after the manner of Hone's Every-day Book; the whole concluded by a page of extract from Keats' poem of the "Eve of St. Agnes." Other months are treated in a similar manner, except that natural history becomes more prominent as the season advances. We need not say that the merit of such a compilation as this depends entirely upon the skill and good taste with which the matter is selected, and in these respects Mrs. Howitt is entitled to commendation. We must, however, remark that the

woodcuts representing natural-history objects ought to have been named. Nests of birds for example.

The London Corporation Coal Tax. (Longmans; a pamphlet.)—Those who are smarting just now under the ruinous price of coals—and who smart more than gardeners?—should read Mr. Dickinson's exposure of this iniquity. The Corporation of London have, by means which we shall not ourselves describe, acquired a legal right to fleece the metropolitan districts over a circle having a radius of 20 miles. Everybody living within this circle must pay the Corporation thirteen pence for every ton of coals he consumes, no matter whether sea-borne or land-borne. In the words of Mr. Dickinson—"There never was a system devised so adapted to fetter and cramp trade, and to subject a whole population to the most degrading interference with their private transactions, at the same time that it inflicted a tax of 8 per cent. on a prime and indispensable necessary of life. One instance shall suffice to exemplify this: Suppose a farmer to have a wharf on the canal side, or merely a landing for manure, just outside of the City circle, and that his dwelling-house were situate rather within that elastic boundary, and that the whole intervening space consisted of his own land, and that he were to purchase of a passing coal trader (hitherto a very ordinary occurrence) a boat-load of coals, and cart them in over his own land to his own home, the farmer, the boat trader, and even the mine proprietor who loaded the coals, would each and all become liable to a penalty of 100*l.*! unless the declarations, returns, certificates, &c., were forwarded to the Corporation Custom-house in London within 48 hours, and the duty paid on the quantity of coal landed. Is this law for Englishmen? Does an act of Parliament 'for granting a drawback on coals' warrant this? Or could it be imagined to compass such a thing? But how and wherefore comes this rigorous taxation of the inhabitants of Hertfordshire to be established for the benefit of the Corporation of London? The answer is, by a series of acts obtained under false pretences." We observe that one of the Corporation witnesses had the audacity to declare to the Royal Commissioners that the whole suburban district ought to be thus put under a forced contribution, in order that the City of London may be beautified, *because the people living within the district use the City, choke its ways,* and render what are called City improvements indispensable. Upon that plea Edinburgh, Dublin, John o'Groats, and the Lands-end ought to be also put under contribution, for the dwellers there undoubtedly contribute to the using and choking up, on which the Corporation rely for the justification of this act of legal plunder, which Mr. Dickinson shows has during the last 21 years amounted to the enormous sum of more than *three million, one hundred and ninety-six thousand pounds.* A municipal body which can defraud its neighbours thus does not require reform, but demands suppression.

New Plants.

46. Spiræa callosa, *Thunberg*, alias *S. Fortunei.* Planchon.

Under this name a very pretty red flowered shrub is becoming common in collections, having been introduced from China by Mr. Fortune. With us it is too apt to form leaves rather than flowers, but the rich ruby tints of such as do appear resemble clusters of gems set in green foliage; in a hot summer we have no doubt the blossoms would be abundant. Such, indeed, would seem to be the case on the continent, if we may trust a figure in the *Flore des Serres*, where M. Planchon has changed the name to S. Fortunei. It is there represented as bearing great corymbose panicles of a blood red colour, producing a far more striking effect than anything we have seen in England. M. Planchon thinks that this is not the *S. callosa* of Thunberg, and, therefore, changes its name, and we say very needlessly. His reasoning upon the subject would be admissible, had Thunberg been a botanist upon the exactness of whose descriptions any reliance could be placed; but as he was just the contrary, his plants, where authentic specimens are unattainable, as is the case here, are so many puzzles, to be identified by probability, rather than by what he says or omits to say. No one, we suppose, can doubt that his plant was some common red flowered Japanese Spiræa; that the present plant undoubtedly is; and it answers to his words as well as plants usually do. M. Planchon has no evidence that the plant was not S. callosa, there is a fair probability that it was; and we cannot perceive the wisdom of perplexing the world with yet another *alias*, when the only reason assignable for doing so is mere conjecture. In the absence of direct proof, one conjecture is as much entitled to attention as another. But the mania for changing names seems incurable, and we shall now have nurserymen selling *Sp. Fortunei* as a fine new Japanese shrub to the very persons who already have it growing in their shrubberies under the name of *S. callosa.*

Garden Memoranda.

Royal Botanic Garden, Dublin.—We learn from the Curator's last annual report that there is now every prospect of this garden possessing a proper house to grow and flower the Victoria Regia and other tropical aquatic plants in, and also a museum of economic botany. An iron house, which was erected for a temporary purpose on the ground now occupied by the building of the Great Industrial Exhibition, has been converted into a museum building, and now occupies a suitable position in the garden. It is certainly not the most appropriate structure for this purpose, but it will suit well as a commencement; and "I have," says Mr. Moore, "little doubt that so soon as the Government and the public see the importance of this department, sufficient means will be provided to make it as creditable as the museums attached to the Botanic Gardens of Kew and Edinburgh, which have been constituted at the public expense." Some of the glazed cases to hold the various articles are in course of construction, and a very considerable collection is already in store to furnish them, consisting of vegetable fibres, barks, gums, oils, &c., used in medicine, the arts, and manufactures, besides various preparations of vegetable products used as food, and fine sections of woods, &c., all of which have been purchased from the British Guiana Department of the Industrial Exhibition. Considerable donations have also been made from other departments in the Exhibition. The proceeds of a garden fête, at which nearly 4000 people attended, have enabled the committee of botany to undertake the erection of a fine stove aquarium house, which is now progressing satisfactorily, and will be ready for the reception of plants early next spring. Thus the desiderata pointed out last year have been supplied, and additional interest, in no small degree, afforded to the public. As regards plants, it is stated that during the present year upwards of 300 species have been supplied to various parties, and more than 100 kinds of seeds, besides collections of grafts of fruit-trees, cuttings of Willows for making Osier-beds, &c. Of the former, 340 species were sent to the Queen's College, Galway, where a botanical garden, on a small scale, is being made, and upwards of 100 to the Queen's College, Cork, for a similar object. In a hasty journey made by Mr. Moore to Connemara, during the latter part of September, some rare Irish plants and flowering specimens were collected for exchange, among which may be noticed Nais flexilis and Potamogeton longifolius, which have not hitherto been found in any other part of the British islands. The former was discovered, by Mr. Oliver, of Newcastle, growing near Roundstone, about two years ago, and the latter by J. Ball, Esq., M.P., about the same time.

In the economic department of the garden some experiments of interest have been instituted. At the Evening Sectional Meetings, held last winter at the Royal Dublin Society, some papers were read on the comparative value of thick and thin growing of root crops, both in chemical and remunerative points of view. The discussions which followed on those occasions showed that great diversity of opinion prevailed on the subject, without any well-ascertained data to reason from, particularly on the latter point. In order, therefore, to assist in elucidating this matter, Mr. Moore determined to institute some experiments. Three portions of ground, measuring each 10 perches, were set aside for the cultivation of Mangold Wurzel, and equal quantities of the same kind of manure were put on each compartment. The seed was sown, last week in April, as follows:

1. Drills 18 ins. apart, plants 1 foot apart in drills.
2. Drills 36 ins. apart, plants 18 ins. apart in drills.
3. Drills 24 ins. apart, plants 14 ins. apart in drills.

The crop was raised on the 18th of November, and the roots carefully weighed, when the following results appeared:—

	Ton.	Cwts.	Qrs.		Tons.	Cwts.	
1.	1	15	2	=	28	8	per imperial acre.
2.	1	9	0	=	23	4	per acre.
3.	1	0	0	=	16	0	per acre.

This experiment, as will be seen, turned out in favour of thick planting. The roots which grew on No. 2 compartment, where they were widest apart, though nearly twice the size of the others, did not weigh so heavy in comparison. The deficiency in weight of No. 3 may have been owing, in some measure, to the roots being of the long red kind, whilst the others, Nos. 1 and 2, were the orange globe, which seemed to suit the ground better. In this department of the garden good examples of all the hardy oil-producing plants were grown. Something of their economic importance may be ascertained, by referring to the amount of saving which has been effected by burning rape oil in the lighthouses round the Irish coast alone. The opening of the garden on every week-day during the past summer, in place of Tuesdays and Fridays, as formerly, appears to have been appreciated by the public; for it is stated that upwards of 16,000 persons visited the grounds during the month of August, which equals the number during a whole year, about 17 years ago; and Mr. Moore strongly recommends the plan to be carried out in future, if Government will afford the means to provide the additional assistance and other contingent necessary expenses. It is mentioned that supplies of plants and flowers have been regularly sent to the Government School of Art twice every week during the session. According to the entries made from the 7th October, 1852, to 24th November, 1853, there have been 800 examples from the conservatories, and 2673 from other departments of the garden, furnished. Contributions of both plants and seeds are reported to continue to be steadily received. "In the estimates," says Mr. Moore, "for the forthcoming year I have requested the Committee of Botany to apply for some small additional sums for the special purposes mentioned. The matter will, I hope, be favourably entertained by Government, especially the annual additional sum asked for, without which it will be impossible to carry on this large establishment as it is now constituted." He adds, "I have only farther to call attention to the state of the dwelling-house, which was long since condemned, and recommended to be removed. It is with feelings of regret one can make any suggestion for the removal of a residence connected with so much historical interest—as that in which Tickel lived, and where he entertained his friend Addison—yet this will, I doubt not, become imperative ere long. The nature of the late improvements has rendered it a great obstacle in the way, besides, it is both uncomfortable and unsafe. A small, commodious house could be built in a better position, and, by using part of the old material in the present building, at a very trifling expense."

We learn that the garden and other departments of the Royal Dublin Society have lately been placed under the control of the Board of Trade at Marlborough House.

FLORICULTURE.

Treatment of the Calceolaria.—Perhaps no flower has yielded so readily to the efforts of the hybridiser as this; for, in a comparatively short period, it has been brought to great perfection. From a pinch of seed, flowers of every shade and colour may be obtained, and when tastefully arranged in the greenhouse or conservatory they never fail to attract particular attention. I generally sow the seed about the beginning of August, in order to allow time for the plants to gain sufficient strength to keep comfortably over the winter. I have found them succeed very well when sown early in spring, but they are considerably later in flowering, and do not stand so long in bloom. Let a few 6-inch pots be filled two-thirds full of drainage and turfy pieces of loam, and mix a compost of loam, leaf-mould, and sand in equal quantities; make it fine, and fill up the pots with it, pressing it to a firm, even surface; sow the seeds, and cover them very slightly with a little fine, sifted soil; moisten the soil carefully, so as not to disturb the seeds, and place the pots in a frame, or in any sheltered situation, out of doors, covered with a hand glass; the soil must be kept in a healthy, moist condition, but not saturated, or the seeds will disappear as quickly as they vegetate. After they have made four leaves, prick them off into pots or pans, prepared as above, only the soil may be used a little coarser. Plant them about an inch apart, shade them carefully, and keep them close for about a week, when they may be allowed a little air. As soon as they begin to crowd each other, they may either be planted again in pans or boxes wider apart than at first, or potted singly in 3 inch pots. If the plants are strong, they may be potted singly with safety; the young roots incline to run near the surface of the soil, so this must never be allowed to get dry or hard. About the middle of October, place them in the greenhouse, on shelves near the glass; water them carefully during winter, and fumigate occasionally with tobacco, to keep them clear of insects. About the present time, shift them into their flowering pots, in a soil of equal parts fibrous loam, leaf-mould, and rotted dung; drain these well, and turn out the young plants carefully, without injuring the roots; pot them deep enough to allow the fresh soil to come well up round the neck of the plants, for here they will emit numerous roots. They must now be judiciously supplied with water, and sprinkled overhead every morning, just as the sun reaches them. As they push up their flower-stems, secure them with a small stake, and, when coming into flower, shade them from bright sun, and let them have all the air possible, night and day. Calceolarias are easily propagated in the following manner:—As soon as the blooming season is past, cut down the flower stems, and pick off all withered and decayed leaves. Select a quiet, shady situation out of doors, and plunge the pots well down in the soil, and fill up among the shoots with leaf-mould. Moisten the soil occasionally if the weather be dry; they will now throw out roots at every shoot; these shoots should then be taken off and potted separately, in 3-inch pots, in a mixture of light loam and leaf-mould. Place them under glass, where they can be kept close and shaded, and they will immediately start and grow rapidly; but, if exposed to currents of air, the juices of the plant will be exhausted before the roots are strong and plentiful enough to supply the deficiency. When placed in their winter quarters, be careful, in watering, not to allow a drop of water on the leaves; examine the plants, and if the pots are filled with roots, give them a shift; this will allow the roots to increase, and the plants to strengthen; when the roots are cramped, it has a tendency to throw the plant prematurely into flower, to its great injury at the proper blooming season. Instead of plunging the pots in the soil, place them in a frame and keep them close and moist; water them occasionally with manure water, to get them into a strong growth; and when they have made shoots of two or three inches in length, take them off, and make them into cuttings. Plant them in a well prepared cutting-pot, and place them in a temperature of about 65°. If the pots are plunged into any material heated to this degree, so much the better; keep them close and shaded, and pot singly when they are rooted. By keeping the old plant growing, two or three courses of cuttings may be obtained; but, with any rare or scarce sort, the following method may be adopted to secure a stock:—After the shoots grow a short time, cut them through in the centre between each joint, and then cut each joint down the middle, thus making two cuttings of each of these joints, with a leaf to each; this leaf must not be damaged in the least, for the success of the process depends entirely on it. Plant these in pots well

prepared, as for sowing the seeds, with the addition of half an inch pure sand at top. Let the cut surface be placed perpendicularly against the side of the pot. Put them in a close, warm frame, and in a short time they will be all finely rooted from the cut surface. Thus, a considerable number may be propagated in a short time from one plant. *S.*

RANUNCULUSES: *Mary.* Beds of these will now require care. We have seen first-rate blooms produced on beds formed by turf, being placed Grass downward 4 inches below the surface. In this solid substratum the fibres struck, and the consequence was they were independent of the vicissitudes of the weather. Again we have seen first-rate blooms from beds which had been saturated with liquid manure during the winter; but the excessive luxuriance of the plants caused a fearful loss amongst them. Our readers will see that the most proper plan to adopt will be the most inexpensive. Stimulants ought in nine cases out of 10 to be avoided, and no one will be far wrong whether it is in Tulips, Carnations, Ranunculuses, Pinks, Pansies, if they treat them with compost whose foundation is decayed vegetable matter.

POLYANTHUSES: *B.* Should they show any precocious blooms, by all means remove them, at the same time top-dressing the beds with decayed Melon-bed manure; this will greatly aid the main bloom.

DAHLIAS: *W.* These should be propagated as fast as they afford shoots. We anticipated a great demand; the slaughter amongst dry roots throughout the country has been immense.

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

CONSERVATORY, &c.—Some of the specimens planted out in the borders, and also some of the twiners, will soon be starting into growth, especially if the weather should be bright; the soil about their roots ought, therefore, to be in a moist healthy state, and if such is not the case, give two or three liberal soakings with soft water, a few degrees warmer than the ordinary temperature of the house. It is advisable, however, to retard the growth of conservatory specimens as long as it can be done without injury to the other inmates of the house, but in conservatories which have been kept at an average temperature of 45° during the winter many things will now be pushing, and every means should be used to encourage healthy vigorous wood. See that every plant is clear of insects before it commences growth, for it is useless to expect success unless insects are kept under, and they are much more easily eradicated, and with less injury to the plant before growth commences than afterwards. Keep the temperature as low as can be done with safety, admitting air freely on fine days, but avoid currents of cold easterly winds. Young plants of such things as Epacrises, Pimeleas, Polygalas, &c., may now be placed in a nice moist temperature of about 45° at night, and from 55° to 60° with sunshine and air. This will induce early growth, secure a long season, and allow of getting the wood well ripened in autumn. When such things, however, are started into growth at this early season they must be kept near the glass, so as to insure their receiving all the light possible; and unless the plants are in prime condition, with well ripened wood, and all necessary care and attention can be afforded them, it will be advisable to let them remain at rest some time longer. The Boronias are exceedingly useful, especially serrulata; they enjoy a comparatively moist warm situation while in growth, and they should now be placed near the glass in a cool end of the stove. COLD PITS.—See that these are properly covered every night, and their inmates carefully protected from frost; for at this season it is very unsafe to calculate upon mild nights.

FORCING DEPARTMENT.

PINERY.—Considerable difficulty is often experienced at this season in getting the plants to show fruit. Plants intended for fruiting early should have been allowed some two months of rest, during which time the soil could hardly have been too dry, but when the object is to induce them to show fruit the soil should be brought into a moist healthy state. Where the plants are grown on the open bed system, considerable attention will be necessary to secure a regular supply of fruit, for where grown in this way it is not so easy to bestow special treatment upon a portion of the stock as when they are in pots. And I very much question whether, except for large establishments, or where a regular succession of fruit is no object, the saving of trouble and the larger fruit obtained by the open bed system, should induce persons with limited accommodation, and who require fruit at all seasons, to give up the old system. Maintain a moist atmosphere, but discontinue syringing those showing fruit until they have done flowering. Succession plants should not be allowed to become pot-bound before repotting, nor to get too dry at the root, as either error would probably cause them to show fruit prematurely. Keep young stock growing slowly, and give air on every favourable opportunity, to secure close sturdy plants. Let the night temperature average from 55° to 60°, shutting up early on the afternoons of bright days, and allowing the thermometer to rise to 80°, for an hour or two after shutting up, and damping the floors, &c., to cause a general moisture. FIGS.—Stop the shoots regularly at the fourth or fifth eye, and keep them closely tied in, and sufficiently thin to admit light and air, so as to get the wood matured, in order to secure a second crop. Where the trees incline to grow too luxuriantly, keep the atmosphere rather dry, and give no more water at the root than may be absolutely necessary to prevent injury to the present crop, for unless short-jointed firm wood can be secured, there is little chance of an abundant crop of fruit. Melons and Cucumbers growing in dung beds will require great care and attention to protect them against sudden changes in the weather, and secure strong short-jointed wood; keep the plants within a few inches of the glass from their first appearance above the soil, and see that the glass is perfectly clean, in order to admit every possible ray of light to strengthen and invigorate the plants. Have a sufficient stock of fermenting materials in readiness with which to renew linings, whenever it may be necessary to do so. Aim at maintaining a night temperature of from 65° to 70°, and admit fresh air on bright days, and whenever it may be necessary to prevent scalding, by raising the sashes on the sheltered side; but do this carefully, as the plants are particularly liable to suffer from currents of cold air. It is, however, very questionable policy to attempt to cultivate very early crops of these in pits heated by fermenting materials, for the saving of labour effected through having a small hot-water tank more than compensates for the expense of fuel; and with such a convenience success is within any careful man's reach, and under the old system this is not always the case. Where Cucumbers are grown in pits or frames heated by manure, keep up a good stock of dung and leaves, ready to be applied as linings whenever they may be wanted. It is a great protection against severe weather, and greatly assists in preventing sudden changes, to thatch the linings with straw hurdles, which protect the bed against cold piercing winds, and greatly economise labour. Keep the plants near the glass, and when possible, give a little fresh air daily, but this should pass through a mat. As soon as the Strawberry plants show for fruit let them be liberally supplied with clear manure water. Keep a low temperature until the fruit is fairly set.

FLOWER GARDEN AND SHRUBBERIES.

Those who have to contend with a stiff soil will find it greatly improved by being lightly forked over when the surface is crusted by frost; and this will also expose the hiding places of slugs, as well as pulverise the ground to a greater extent than would otherwise be the case. The hardier kinds of Roses should be planted at once, and the beds prepared for the Tea and other tender sorts. It is useless to expect Roses to grow vigorously and bloom freely late in the season, unless they are afforded a deep rich soil; and where necessary it should be made so before planting, always taking care to secure perfect drainage, for the Teas, &c., are very impatient of stagnant water at the root. But the great thing to be attended to in connection with this department at present is to provide plenty of bedding-out stock. Every cutting should be put in before March, and a small surplus stock of everything should be provided. It is possible to root cuttings of bedding stock, and to have them ready by turning out time, even if they are not got in before the middle of March; but plants hastily got up, and suddenly checked in their growth, as is necessarily the case when propagation is deferred till late in spring, make a poor figure in the beds for a long time after planting, and in unfavourable seasons and situations are hardly got round in time to cover the beds before they are cut off by the autumn frosts. It is of the greatest importance to get the stock rooted early, so as to allow of getting strong plants without growing them in a high moist temperature.

KITCHEN GARDEN AND HARDY FRUIT DEPARTMENT.

Peas that are above ground should have the soil drawn up on each side of them so as to break the wind, and it is a very good practice to apply the stakes, filling up the bottom on the windy side with Spruce or Yew branches, which form a great protection against cutting winds. Attend to keeping up a succession, by making a fresh sowing as soon as the last appears above ground. Of all our summer Peas, Fairbeard's Champion of England is one of the very best in quality, and it should be planted to succeed the early kinds. Parsnips should be sown on deep, rich soil, if not already done; and Jerusalem Artichokes should also be planted as soon as it can be done. On light, dry soil, Onions may now be sown, as may also Brussels Sprouts, Savoys, Leeks, Parsley, Turnips, Early Horn Carrot, Lettuce, &c.; but on stiff, wet soils, the seeds will be better in their papers for another week or fortnight. Do not neglect to introduce proper quantities of Seakale, Rhubarb, and Asparagus into heat at regular intervals so as to provide a constant supply.

COTTAGERS' GARDEN.

It is a too common practice with cottagers to defer pruning the Vine till late in spring, and of all other fruit trees it is the most injured by late pruning, for unless the wounds have time to heal, when the sap begins to flow in spring the Vine bleeds profusely instead of pushing its buds. Those who are fond of flowers should sow a few pots of annuals, which if carefully nursed, keeping them from frost, giving them a sufficient supply of water, and all the light and air possible, will make very pretty objects in May, and will remain a considerable time in beauty. Indeed there are few more suitable plants for a cottage window than the Nemophilas, &c. If the Parsnip bed is not already sown, this should be done the first favourable opportunity. Sow in drills 15 inches apart, on ground that is in good heart, and which has been dug 2 feet deep, but not manured this season. Look over the autumn planted Cabbages and make good any deficiencies, then stir the soil between the rows to the depth of 3 or 4 inches. Clean old Strawberry beds, and sprinkle a little good rotten manure between the rows, forking it slightly in. Fresh plantations of these may now be made, where this was neglected to be done last August, which is the proper season for the operation.

STATE OF THE WEATHER AT CHISWICK, NEAR LONDON,
For the week ending Feb. 16, 1854, as observed at the Horticultural Gardens

February.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Min.	Mean	Of the Earth. 1 foot deep.	2 feet deep.	Wind.	Rain.

The highest temperature during the above period occurred on the 24th, 1846—therm. 59 deg.; and the lowest on the 20th, 1852—therm. 15 deg.

Notices to Correspondents.

BACK NUMBERS: Full price will be given for the following Numbers:—1852, No. 45; 1845, No. 24; 1848, No. 46.

BOOKS: *Young Gardener.* If you have thoroughly studied and mastered the little works on perspective drawing published by Chambers, we should think that, as a gardener, you know enough of the subject, and would now advise you to turn your attention to something else.‡—*M J.* We know of no better catalogues of plants than Loudon's "Hortus Britannicus" and Paxton's "Botanical Dictionary." See, however, that you have the last editions of them.‡ — *A B, Peterefield.* There is no modern book so useful to those who have the management of woodlands of any kind as the last edition of "Brown's Forester," which contains all that you can want to know, and which may be followed even blindly.—*J E.* What are called "Herbals," that is to say, books under this name professing to explain the *virtues* of plants, are all rubbish. Books on Materia Medica, or such works as "Christison on Poisons," or "Lindley's Flora Medica," or "Medical and Œconomical Botany" are the only safe guides.

BOTANY: *Ambitious.* You cannot dispense with a good magnifying glass. If you attempt to study vegetable anatomy, on which physiology is founded, you ought to employ the dissecting knife and achromatic microscope, unless you are content to see with other men's eyes, in which case you need not have either.

CANTUA DEPENDENS: *Sub.* It is a native of Peru.

CEDAR OF LEBANON: *C W S.* Many thanks. A kind correspondent had previously sent us a piece of a limb, full 4 feet long.

CONSERVATORIES: *M J.* Excuse our saying that your inquiries should be addressed to an architect or hothouse builder. To reply fully, requires an amount of space not at our command. As a general rule, span-roofed houses are better than lean-to's; and 4-inch pipes are better than any other size. The nursery to supply your conservatory need be nothing more than a range of low pits.

ESCALLONIA MACRANTHA: *R W.* It stands ordinary winters well about London unprotected, but we find that the late severe weather has somewhat injured a plant of it in the Garden of the Horticultural Society. It may, nevertheless, be considered hardy.‡

FERTILISING POWDERS: *Jas Biggar.* We have no faith. The experiments tried here in the south, under our own eye, were not attended by any satisfactory result. As to steeping, &c., you surely do not believe in that. It might as well be said that a man may be fed by rubbing his skin with dough once a year.

GALVANISED IRON TRELLISES: *Diss.* In the case of various fruit trees, and likewise some kinds of ornamental plants, galvanised iron wires have occasioned dead patches, and gum, where young shoots were in contact with them, and such as we have not observed in shoots trained to ungalvanised iron wire. The latter should, however, be painted, otherwise its rust will prove injurious. If galvanised wire were painted, its bad effects might be greatly lessened. When not painted, it supports, by attraction, a large magnet; but when well painted, it loses this power.‖

GLASS: *Dido.* By all means use Hartley's rough plate, which, if the right kind, will doubtless be found to answer your purpose.‡

HORTICULTURAL SOCIETY: *H R M.* The admission fee was reduced from 6*l.* 6*s.* to 2*l.* 2*s.* some years since.

INSECTS: *Ignoramus* Your vermin, as you may well call them, are crab-lice (Phthirus inguinalis). *W.*

OAKS: *S W B* will feel obliged by some of our correspondents informing him what will be the best nurses for Oaks in a plantation, in a clay soil, as he fears Larch may not succeed on clay; and at what distances Oaks and nurses should be planted. The spot of ground in view has been for some years left to nature, and on it many straight and vigorous self-sown plants (Oak) have sprung up, nursed by closely growing Hornbeam, also self-produced. The land is just drained.

NAMES OF FRUITS: *Iota.* Most probably the Ord Apple. Observe whether the fruit is not peculiarly marked with ferruginous specks.‡—*J R.* Buchanan's Spring Beurré and Catillac, the latter is a stewing Pear.‖

NAMES OF PLANTS. We have been so often obliged reluctantly to decline naming heaps of dried or other plants, that we venture to request our correspondents to recollect that we never have, or could have, undertaken an unlimited duty of this kind. Young gardeners, to whom these remarks more especially apply, should bear in mind that, before applying to us for assistance, they should exhaust their other means of gaining information. We cannot save them the trouble of examining and thinking for themselves; nor would it be desirable if we could. All we can do is to *help* them—and that most willingly. It is now requested that, in future, not more than four plants may be sent us at one time.—*W M.* They are not in a state to be named. One looks like Hippeastrum vittatum.—*J C Atkinson.* Plants in such a state cannot be named. It is some Carex.—*H T.* Plants out of flower *cannot* be named. Yours looks like a bit of Senecio Petasitis, but it may be something else. When plants become so filthy as yours, from neglect, they cannot be cleaned, but ought to be burnt, in order that others may not be infected.—*J A F.* Hoitzia coccinea; how did you manage to get so beautiful a specimem of so shy a plant? Mere leaves cannot be named.

VINES: *J J P.* There is no reason why your Vines should not be planted inside your house, and many why they should be, unless you have a low cold soil, in which case the roots should be in a raised sloping border on the south side. We see no advantage in training the Vines downwards. Do not overdose your border with strong rank manure, and your Vines will not make too much wood. It is essential that the Vine border should be secured against cold; if artificially warmed a *little*, so much the better.

THE LONDON MANURE COMPANY'S WHEAT MANURE, made principally from animal substances, yielding nitrogen by slow decomposition, will be found most valuable at the present season. The London Manure Company supply on the best terms Peruvian Guano, Nitrate of Soda, Superphosphate of Lime, Sulphate of Ammonia, Fishery and Agricultural Salt, and every other Artificial Manure. EDWARD PURSER, Sec.
Bridge Street, Blackfriars.

PERUVIAN GUANO, the guaranteed import of Messrs. ANTONY GIBBS AND SONS, Lobos Island Guano, Superphosphate of Lime, and all Artificial Manures, Linseed and Rape Cakes, &c.—WM. INGLIS CABNE, 10, Mark Lane, London.

ARTIFICIAL MANURES, &c. — Manufacturers and others engaged in making ARTIFICIAL MANURES may obtain every necessary instruction for their economical and efficient preparation, by applying to J. C. NESBIT, F.G.S., &c., Principal of the Agricultural and Chemical College, Kennington, London. Analyses of Soils, Guanos, Superphosphates of Lime, Coprolites, &c., and Assays of Gold, Silver, and other Minerals, are executed with accuracy and dispatch.
Gentlemen desirous of receiving instructions in Chemical Analysis and Assaying, will find ample facility and accommodation at the College.

PEAT MOSS CHARCOAL, AND OTHER MANURES.—The Undersigned are appointed sole Agents by the Peat Moss Charcoal Company, for the sale of this valuable fixer and distributor of ammoniacal matter.
Also on Sale, Peruvian Guano, Superphosphate of Lime, Gypsum, Nitrate of Soda, Bone-Dust, Sulphuric Acid, and all other Manures of known value.—Apply to MARK FOTHERGILL & Co., 204A, Upper Thames Street, London.

THE FOLLOWING MANURES are manufactured at Mr. LAWES' Factory, Deptford Creek:—Turnip Manure, 7*l.* per ton: Superphosphate of Lime, 7*l.*; Sulphuric Acid and Coprolites, 6*l.*
Office, 69, King William Street, City, London.
N B. Genuine Peruvian Guano, guaranteed to contain 16 per cent of ammonia. Nitrate of Soda, Sulphate of Ammonia, and other Chemical Manures.

SUPERPHOSPHATE OF LIME MANUFACTURED BY MR. J. C. NESBIT'S IMPROVED STEAM MACHINE. The following is the analysis of an average sample.
"College of Chemistry, Agriculture, and General Science, 38 & 39, Lower Kennington Lane, London.
Analysis of Sample of Superphosphate of Lime from Mr. Jolliffe:

Moisture		13.97
Organic Matter, &c.		21.98
Silica		6.05
Phosphate of Lime		35.27
SOLUBLE	16.10	
INSOLUBLE	19.17	
Sulphate of Lime, &c....		22.73
		100.00
Nitrogen (equal to)		1.16
Ammonia		1.41

(Signed) J. C. NESBIT."
Delivered free at a Wharf or Railway Station in London at 6*l.* per ton.—Apply to E. Y. JOLLIFFE, 70, Mark Lane, or the Works, Lavender Dock Wharf, Rotherhithe.
Agents wanted in all the principal towns.

WARNER'S PATENT FARM AND COTTAGE PUMPS.

Cast-iron Pumps for the use of Farms, Cottages, Manure Tanks, and Shallow Wells.

	£	s.	d
Patent Pump	1	15	0
Patent Pump, with 15 feet of lead pipe attached, and bolts and nuts ready for fixing	3	0	0

Larger sizes if required.
The smaller sizes are also much used for supplying Hot, Forcing, and Plant Houses, from underground Water Tanks, and can be readily fixed in any situation.
May be obtained of any Ironmonger or Plumber in Town or Country, or of the Patentees and Manufacturers,
JOHN WARNER & SONS,
8, CRESCENT, JEWIN STREET, LONDON.
Every description of Machinery for Raising Water; Fire Engines, &c.
An Illustrated Book sent on application post free.

PARKES' STEEL DIGGING FORKS & DRAINING TOOLS. MESSRS. BURGESS AND KEY, as Mr. PARKES' Wholesale Agents for England, have always in stock a large assortment. These Forks and Tools are now in use by upwards of 1000 of the Nobility and Farmers, members of the Royal Agricultural Society, who pronounce them to be the best ever invented, and to facilitate labour at least 20 per cent. The Royal Agricultural Society has three times awarded their prize. Price Lists sent on application, and Illustrated Catalogues of the best Farm Implements, on receipt of eight postage stamps.
103, Newgate Street, and 52, Little Britain, London.

ANTHONY'S PATENT AMERICAN CHURN.—Extract from the Royal Agricultural Society's Report of the trial of Churns at the Gloucester meeting in July last. "In this trial the American Churn not only maintained its character in producing butter rapidly, but in producing a greater quantity from the like amount of cream." It made from 4 quarts of cream 4 lbs. 6 oz. of butter, being 8 oz. more than any of the other Churns from the same quantity and quality of cream. Price Lists of Churns and Implements by the best makers sent free, and Illustrated Catalogues on receipt of eight postage stamps. BURGESS & KEY, 103, Newgate Street, and 52, Little Britain, London, who have always a large stock of Steam-engines, Ploughs, Harrows, Diggers, Waggons, Carts, Threshing and Dressing Machines, Mills, Oat and Grain Bruisers, Oilcake Breakers, Reaping Machines, Haymakers, Horse-rakers, Turnip Cutters, Liquid Manure Carts, Parkes' celebrated Steel Digging Forks and Draining Tools, Pumps for Manure, Farm Fire Engines, and for Garden Purposes, &c. &c.

WATERPROOF PATHS.—BARN AND CATTLE SHED FLOORS.

THOSE who would enjoy their Gardens during the winter months should construct their walks of PORTLAND CEMENT CONCRETE, which are formed thus:—Screen the gravel of which the path is at present made from the loam which is mixed with it, and to every part of clean gravel add one of sharp river sand. To five parts of such equal mixture add one of Portland Cement, and incorporate the whole well in the dry state before applying the water. It may then be laid on 2 inches thick. Any labourer can mix and spread it. No tool is required beyond the spade, and in 48 hours it becomes as hard as a rock. Vegetation cannot grow through or upon it, and it resists the action of the severest frost. It is necessary, as water does not soak through it, to give a fall from the middle of the path towards the sides.
The same preparation makes first-rate paving for BARNS, CATTLE-SHEDS, FARM-YARDS, and all other situations where a clean, hard bottom is a desideratum. May be laid in winter equally well as in summer.
Manufacturers of the Cement, J. B. WHITE & BROTHERS, Millbank Street, Westminster.

PATENT ROOT GRATING MACHINE.

BUSHE & BARTER'S PATENT ROOT GRATING MACHINE, Manufactured and Sold by ALEX. SHANKS & SON, Arbroath, Forfarshire, from whom particulars, with prices, may be had.—Arbroath, Feb. 18.

HOSE PIPING.
TO ENGINEERS, AGRICULTURISTS, GARDENERS, SHIP-CHANDLERS, AND FIRE BRIGADES.

WAITHMAN'S PATENT FLAX TUBING (1-inch to 3-inch diameter) will sustain a greater pressure, is lighter, less bulky, will wear longer, and is about 60 per cent. cheaper than the leather hose pipe, and about half the price of either the gutta percha or the seamless hose. It is prepared so as to be anti-rot.
Manufactured only by WAITHMAN & Co., 36, High Street, Manchester.

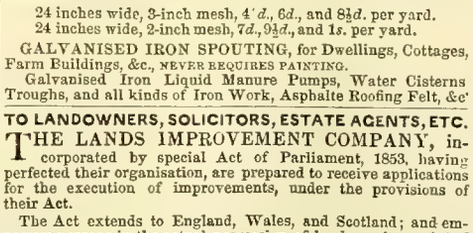
LAND DRAINAGE.
MR. BAILEY DENTON'S TABLES OF COST, &c., price 1*s.* 4*d.* Sold by METCHIM, Parliament Street.
MR. BAILEY DENTON'S WORKMAN'S A LEVEL, price 1*l.* 10*s.* Sold by JONES & Co., High Holborn, London.

LAND DRAINAGE.
MR. JOHNSON begs to inform Landowners, Agents, &c., that he is prepared to undertake the Drainage of Land, either by Contract or by a small charge per acre for planning and setting out the Drains, taking Levels, superintending the Work, &c.
Mr. J. has been for several years constantly employed as a Drainer in most of the Counties in England, and can give numerous satisfactory references. Plans for Tilery Buildings, and every information on Drainage can be obtained at the Office, 12, Abingdon Street, Westminster.

WEIR'S DRAINING LEVEL, PRICE 30*s.*
These Draining Levels have lately been greatly improved; they have stood the test of five years' use, during which upwards of 1000 of them have been sold. They are so simple that any labourer who can read can use them. They require no graduated staff, the index telling at once the rise and fall in inches without any computation.
EDWARD WEIR, Agricultural Engineer, 16, Bath Place, New Road, (6 Doors West of the Hampstead Road), Removed from Oxford Street.

TANNED NETTING, for the protection of Fruit Trees from frost, blight, and birds, and for the security of fresh sown seeds, either in Gardens or Fields, at 1*d.* per square yard; 200 yards, 14*s.*; 500 yards, 30*s.*; 1000 yards, 50*s.* Scrim Canvass, for Wall Fruit.—At EDGINGTON and Co.'s, 17, Smithfield Bars, City, and Old Kent Road, Southwark, where may be seen erected Emigrant Tents in great varieties, on their latest improved principles, and also at Brunswick Street, Poplar, near the East India Export Dock.

H. J. MORTON AND CO, 2, Basinghall Buildings, Leeds.—GALVANISED GAME AND POULTRY NETTING, very strong and neat, NEVER REQUIRES PAINTING.



24 inches wide, 3-inch mesh, 4'*d.*, 6*d.*, and 8½*d.* per yard.
24 inches wide, 2-inch mesh, 7*d.*, 9½*d.*, and 1*s.* per yard.
GALVANISED IRON SPOUTING, for Dwellings, Cottages, Farm Buildings, &c., NEVER REQUIRES PAINTING.
Galvanised Iron Liquid Manure Pumps, Water Cisterns Troughs, and all kinds of Iron Work, Asphalte Roofing Felt, &c.

TO LANDOWNERS, SOLICITORS, ESTATE AGENTS, ETC.
THE LANDS IMPROVEMENT COMPANY, incorporated by special Act of Parliament, 1853, having perfected their organisation, are prepared to receive applications for the execution of improvements, under the provisions of their Act.
The Act extends to England, Wales, and Scotland; and empowers persons in the actual possession of lands, or in receipt of the rents, such as tenants for life, trustees, bodies corporate, incumbents of benefices, mortgagees in possession, guardians of infants, &c., to effect substantial improvements on their estates, and to convert the outlay on such improvements into a terminable annuity or rent-charge of from 14 to 25 years, at will.
The Company, acting under the supervision of the Inclosure Commissioners, will undertake and execute improvements, or will supply the capital to landowners preferring to execute improvements themselves, or will grant the powers of their Act to landowners seeking merely to charge the inheritance with the outlay on improvements from their own funds.
The Agricultural Works of Improvement particularly specified in the Company's Act, are:—
1. The Drainage of any Lands by any such means as the Inclosure Commissioners shall approve.
2. Irrigation, and Warping of Lands.
3. Embanking of Land from the Sea, or Tidal Waters, or Rivers, in a permanent manner.
4. Enclosing or Improving the Drains, Streams, or Watercourses of the Land, under the Inclosure Commissioners.
5. Reclamation of Land lying waste.
6. Making Farm-roads to the extent of one-half of the outlay for such roads.
7. Clearing Lands.
8. Erection of Farm-houses, and other Buildings required for farm purposes to the extent of three-fourths of the outlay for such Farm-houses and other Buildings.
In effecting the above Improvements there may be erected any Engines, Machinery, Engine-houses, Mills, Kilns, Sheds, Yards, Shafts, Tanks, and Reservoirs, Pipes, Conduits, and Watercourses for Irrigation, Tram-roads and other ways, Bridges, Weirs, Sluices, Flood-gates, and Hatches.
For Forms of Application and further Information apply to the Hon. W. NAPIER, Managing Director, 2, Old Palace Yard, Westminster, London.

BY HER MAJESTY'S ROYAL LETTERS PATENT.
BAILY'S ROUP AND CONDITION PILLS FOR POULTRY.—This remedy has been extensively tried with uniform success, and is offered to amateurs and the public with the greatest confidence. It will effectually overcome that disease which has hitherto been the bane of the poultry-yard, and destroy that apprehension known to all poultry keepers, when a favourite and valuable fowl is seen to droop. It is inestimable for poultry returning from exhibitions, and greatly facilitates moulting.—Sold, with full instructions for use, in boxes containing 50 pills, by JOHN BAILY, 113, Mount Street, Grosvenor Square, price 3*s.* per box, or by post 3*s.* 4*d.* "Fowls, by Baily," the most useful and plainest treatise of the day; price 2*s.*, by post 2*s.* 6*d.*
Baily's Registered Fountains, universally adopted and approved. Drawings and particulars, by post, on application.—113, Mount Street, Grosvenor Square.

"FRIGI DOMO."—Patronised by her Majesty the Queen, Duke of Northumberland for Syon House, Professor Lindley for the Horticultural Society, Sir Joseph Paxton for the Crystal Palace, Royal Zoological Society, and Mrs. Lawrence, of Ealing Park.
"FRIGI DOMO," a Canvass made of prepared Hair and Wool, a perfect non-conductor of Heat and Cold, keeping, wherever it is applied, a fixed temperature. It is adapted for all horticultural and floricultural purposes, for preserving Fruits and Flowers from the scorching rays of the sun, from wind, and from attacks of insects and morning frosts. To be had in any required length, upwards of 2 yards wide, at 1*s.* 6*d.* per yard run, of E. T. ARCHER, Carpet Manufacturer, 451, Oxford Street, London.—Manufactory, Royal Mills, Wandsworth, Surrey.

STEPHENSON AND PEILL, 61, Gracechurch Street, London, and 17, New Park Street, Southwark, Manufacturers of Copper Cylindrical and Improved Conical Iron BOILERS, and Conservatory and Hothouse Builders, either in Wood or Iron, respectfully call the attention of the Nobility, Gentry, and Nurserymen to their simple but efficacious method of warming Horticultural and other Buildings by Hot Water.
From the extensive works they have executed, references of the highest respectability can be given, and full particulars furnished on application.

CLOVER SEED.
GENUINE NEW CLOVER SEED *may be obtained of the undersigned. Prices (according to market and quantity required) will be forwarded on application.*
JOHN SUTTON & SONS, *Seed Growers, Reading, Berks.*

The Agricultural Gazette.

SATURDAY, FEBRUARY 18, 1854.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
WEDNESDAY, Feb. 22—Agricultural Society of England.
THURSDAY, — 23—Agricultural Imp. Society of Ireland.
WEDNESDAY, March 1—Agricultural Society of England.
THURSDAY, — 2—Agricultural Imp. Society of Ireland.

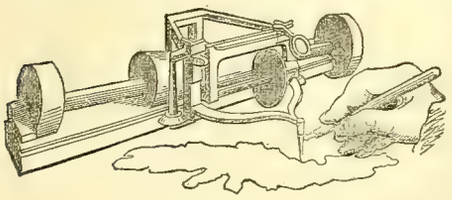
IN reference to the subject of CATTLE VALUATION, we may mention that we have procured the carcase weight of the white short-horn heifer shown by Mr. AMBLER, at the late meeting of the Smithfield Club, at Baker Street. The particulars are as follows:—

No. 75. Age, 3 years 11 months; length, 5 feet 4 inches; girth, 9 feet; weight by CAREY's gauge, 106 stones—by EWART's gauge, 108 stones, 113 stones, and 117 stones, when read as fat, very fat, and extra fat, respectively. The actual weight was 1615 lbs. or 115½ stones. And this result appears to be so corroborative of our former remarks on the merits of EWART's cattle-gauge, that we give it this prominent place in our columns.

THE repeated discussion of THE GUANO QUESTION in Parliament, by our Agricultural Societies, and in the public prints, must, we should think, ultimately open the eyes of the Peruvian Government to its true interests. If that should happily be the case, then the temporary stoppage of supplies will be an inconvenience gladly borne for the benefits derived from the excitement it has produced. On last Tuesday Colonel BLAIR called the attention of the House of Commons to the subject. His speech well deserves a perusal for the evidence it presents on the great and increasing agricultural importance of the subject, and on the careless style in which the Peruvian Government appears to deal with it. This latter aspect of the affair is referred to by Mr. CAIRD in the *Times* of last Thursday. He tells us that the facilities at the islands for loading are no greater than they were seven years ago, when the exportation was about a tenth what it is at present; and upwards of 80 days are now spent in getting a cargo, which under proper arrangements would not occupy a week. "This delay can be no advantage to the Peruvian Government, and an open trade would be immediately followed by arrangements for expediting the loading of ships." It is satisfactory to learn from Mr. CARDWELL and Sir J. GRAHAM that every possible influence which can legitimately be brought to bear upon the Peruvian Government by our own, has been and will continue to be so directed. Among them, of course, is continued effort in the search after supplies elsewhere—and Sir J. GRAHAM referred to instructions in connection with the subject which had been issued to our admiral in the Pacific, and to the prospect of a successful issue to the search which is being conducted in the Eastern seas. To this and to the home manufacture of competing fertilisers, Mr. CAIRD addresses himself in his very interesting letter published in the *Times* of Thursday. He does not however, neglect to urge the propriety of continued remonstrance, addressed to the Peruvian Government, illustrating the probability of its success by the

experience of the United States' Government, for "we know that the effect of American remonstrance somehow or other has given largely increased supplies there, during the very time that ours have diminished. At the meeting of the Royal Agricultural Society yesterday, Mr. Pusey and the Duke of Richmond publicly stated their intention of availing themselves of this, by ordering the purchase of a cargo through American agency, to be delivered in this country."

The subjoined woodcut will have been noticed by many of our readers in the advertisement of Sang's Platometer, which it is intended to represent. The instrument professes to indicate the number of square inches in any plan round the edge of which the pointer has been carried; and this it *does* as



perfectly as it professes to do it. In certain trial cases, quoted in a published account of the instrument, the area of a figure was ascertained successive times by scale and calculation, and by the platometer, and the results given by the latter method varied less among themselves than those given by the former, showing that the accuracy of the instrument exceeds that of the scale.

The instrument itself has immediate relation to a very important department of rural economy, and is besides such a remarkable instance of simple and beautiful design that we must endeavour to bring it more pointedly under the notice of our readers. It consists essentially of a framework on rollers of such breadth and weight that the whole will move to and fro only parallelly to itself. Between these rollers is slung a cone, whose axis of revolution is horizontal, and exactly transverse to the to-and-fro motion of the framework — it is, in fact, the axis of the rollers, and revolves with them. Pressing against the surface of this cone is a small wheel kept close against it by a spring; this wheel is part of an independent portion of the instrument, so connected with it that it and the rest of its parts may be freely moved to and fro between the rollers, always pressing against the conical surface, at whatever part of that surface it may be. When the whole instrument is moved "to" the operator, the revolution of the cone gives a + or *positive* motion to this wheel; when moved "from" him, the wheel suffers what in relation to the other may be called a — or *negative* motion. Now let it be observed that the amount of motion suffered by the wheel either way depends not only on the number of inches to or fro of the whole instrument upon the plan—not only on the *angular* motion of the cone so effected, but also upon the position which it occupies on the conical surface; on the distance, in fact, at which it stands from the apex of the cone in question. For the amount of *surface* of the cone which passes before the wheel depends not only upon the *angular* motion (alike for all parts of the cone together), but upon the thickness of the cone at that particular place; and this, again, is directly proportioned to the distance of that place from the point or apex. It appears, therefore, that the number of degrees on the rim of the wheel, which may have passed any fixed point beside it, depends upon two things—the distance (d) of the wheel from the apex of the cone, and the breadth (b) of the traverse made by the whole instrument on the paper; it is, in fact, therefore, directly proportioned to the product $b\,d$ of these two elements. But the product of these two elements represents the *surface* whose length is d and breadth b; it only needs, therefore, that by a trial process the rim of the wheel be graduated to read square inches, and we shall have in it a contrivance by which, in reference to any rectangular figure (one pair of whose sides are parallel to the axis of the cone, and the other pair placed, one at the apex of the cone and the other anywhere nearer its base), its area in *square* inches may be ascertained by simply drawing the wheel along the edge of this its further transverse side: the wheel, or a pointer connected with it, being run along this further transverse side, the graduations on its rim will indicate the number of square inches on the figure in question. Now it is obvious that all figures, however irregular, may be considered as made up of a series of exceedingly narrow rectangular pieces lying parallelly side by side. And if any figure be placed between two parallel lines, drawn so as that they shall just touch it both at top and bottom, and a third line be drawn at one side of the figure, at right angles to these parallel lines, then the *outline* of figure or plan will be divided into two portions at the points of its contact with the parallel lines, and its *area* may be considered as the difference between two, one larger and the other smaller, both of which have three sides in common —these three rectangular lines which have just been drawn—the fourth side being in the one case the right half of the outline of the figure, and in the other the left half of the outline of the figure. Conceive these three lines so drawn as that the two parallel ones shall be parallel to the axis of the cone of the instrument, and the third transverse one shall be just in the position of the apex of the cone, then we say that on drawing the pointer along the irregular edge of the fourth side of the larger figure, from the place where it touches the upper parallel line to the place where it touches the lower parallel line, you will have in the indications furnished by the graduation of the wheel a record of the area of the *sum* of those narrow rectangular pieces into which the *whole* figure (with its three rectangular sides) may be divided. Now observe the effect of tracing the pointer round the irregular outline of the other half of the plan, which lies *within* this larger figure whose area has been recorded—the motion of the cone is now negative, and a little consideration will convince you that the effect will be to subtract, from the result recorded of the *whole figure*, so much as corresponds to that part of it, confined within the three rectangular lines*, which lies *outside* of the plan whose area is wanted. So that, on reaching the starting point, the rim of the index wheel will indicate just the area of the plan round whose irregular outline the pointer has been carried. These remarks must suffice in reference to the exceedingly beautiful and simple principle on which the successful operation of the instrument depends; we believe they will be intelligible to any careful reader, and we are sure he will agree with us that Mr. Sang has displayed most admirable ingenuity in the contrivance of it. We add in another column his own reference to its construction and operation.

To our report, at p. 92, of the discussion last week before the Central Farmers' Club, on the present method of ascertaining the Corn Averages, we have to add that a deputation from the club has had an interview with Mr. Cardwell, at the office of the Board of Trade, for the purpose of urging the resolution of the club upon his attention. That aspect of it which relates to the injustice of the plan at present adopted was at once admitted. The object being to ascertain the average prices of agricultural produce for the purpose of regulating the money payments due from the farmer, whether in lieu of tithe or rent, it is obviously the prices to the farmer that should be recorded, but this is not the case. The first sale is not the only sale which is registered; the same corn may be resold more than once, and the higher value acquired at each change of ownership thus affects the average; and the payments of the original owner in his dealings with the rector or the landowner are made according to the average of all the prices it has borne, although his receipts were according only to the lowest of them Mr. Skelton, of Lincolnshire, at the interview with Mr. Cardwell, put this very clearly. He knew instances during the past autumn, where cargoes of Wheat had been sold three or four times over, and each time there was an advance of 4*s*., 6*s*., and even 8*s*. a quarter. It is plain that the profits of these repeated sales not being agricultural profits, they ought not to affect averages on which agricultural payments depend. That they do so arises out of the present imperfect way of taking the averages. The imperial average price of the period is raised by such transactions at the expense of the occupiers of the soil, although not a fraction of the rise in price does, in such instances, go into the pockets of these occupiers.

Not only, however, is it an average of prices which the farmer has not realised that stands for the imperial average price of corn—but it is an average of a very small fraction indeed of all the English corn that is sold in the country. Very often no sales at all are recorded, although many sales have been made, and very often indeed is there nothing more than an inconsiderable fraction of the whole reported. Injustice arises in the first place, then, from reporting much of it more than once; and in the second place, by reporting a great deal not at all. The evil and the injustice were obvious enough; the difficulty was to remedy them, and on this point there was by no means unanimity of opinion. Mr. Pile, of Winchester, suggested the enforcement of a monthly return of sales from all growers of corn, and from them only; this enforcement to be guaranteed by the infliction of a small penalty in the event of non-compliance. This Sir J. Shelley objected to—referring, however, as we understand, rather to the enforcement of general statistical returns than to a mere report of sales. The deputation retired without any agreement having been arrived at on the plan by which their object could be attained; but a great step, we are sure, towards that attainment was taken by them when the injustice and the evil complained of were so fairly stated to the country, and so frankly admitted by the Minister.

The Central Farmers' Club are well fulfilling their duty in discussing points of such practical importance as this, and in urging them upon the attention of Government.

* It is easy to see that the three rectangular lines are merely imaginary ones, and only used for explaining the operation of the instrument.

PERUVIAN GUANO.

In a recent Paper I observe an article signed "T. G.," expressing an opinion that Peruvian guano consists of partly decomposed vegetable matter. "T. G." is a well known initial for "Travelling Gentleman," but your theoretical correspondent is evidently not one of that class, although apparently a man of experiment, and of an inquiring mind. I have therefore much pleasure in setting him right in this particular, having practically studied the question as far back as the year 1840, before a single cargo of this precious manure ever came to England, being one of the first to make a personal and scientific investigation of the matter; examining in fact all the deposits on the west coast of South America previously to "T. G.'s" shutting up his grains of Mustard seed in the box; and, however I may fail in shaking his faith, I have no hesitation in saying that not the least particle of vegetable matter exists in the composition of Peruvian guano in its natural state, although no doubt a good deal of adulteration may take place after it gets out of the hands of legitimate importers. In the first place, upon this extraordinary coast for several hundreds of miles it never rains; all is barren—not a blade of Gra s is to be seen. Not an insect exists, or even a bird, save the sea birds that deposit this rich manure, and which subsist wholly on fish, of which myriads abound along the coast all the year round; these birds continue fishing by day, and return to roost upon the adjacent rocks and islets at night, where they cluster so thickly that the whole surface is densely covered, and their deposits in layers become partly baked by the heat of their bodies, and completely so by the action of the sun during the day time; thus layer on layer is formed, each layer being distinctly visible in section, like the leaves of a book, from the top to the bottom of the cliffs formed by the workmen in the act of removing it for shipment; these cliffs upon the Chincha Islands are upwards of 100 feet in height, bearing a close resemblance to the sand cliff pits at Erith, although of far greater extent.

My attention was first called to this interesting subject in the month of October, 1840, whilst making the first voyage by steam down the coast, from Valparaiso to Callao, in command of the Pacific Steam Navigation Company's steam-ship Peru, when we ran close along shore, and fell in with several vessels laden with guano, bound to Arica and Islay, and ascertained that they had loaded their cargoes at the Pavillon de Pica and the Chincha Islands; the former a remarkable, high, projecting crag, in the form of a sugar-loaf, jutting out from the coast to the southward of Iquique, and the former a group of islands near the port of Pisco. I felt very curious and desirous of examining these places, and to get all the information I could from parties I met with, trading in the article, as to the supply and demand, &c.; but no one seemed to know much about it, either statistically or geologically—some affirming it to be a mineral production, others the dung of sea fowl—so I took the earliest opportunity that presented itself to judge for myself, and from time to time visited these famous guaneros. Upon first landing, and beholding the immense masses of this seemingly inexhaustible material, it was difficult to bring the mind to suppose that the ponderous cliffs of apparently red and grey soil, embracing so many millions of tons in extent, were really the excrement of birds. However, learning from the working men and intelligent foremen that the skeletons and feathers of sea fowl were occasionally dug up at great depths, together with eggs converted into sal ammoniac, and taking into consideration that it never rains on this part of the coast, seeing also the immense shoals of fish and flocks of sea birds that abounded along the shore, I at once concluded that it must be the dung of sea fowl, the accumulation of ages. About this time Mr. Bland, an English merchant, with whom I had the pleasure of becoming acquainted, together with M. Barroliêt, a French gentleman, had obtained permission from the Bolivian Government to send a cargo of guano to England, which was shipped at Pakeke, a headland to the northward of Cobija, the principal seaport of Bolivia, in a vessel called the "Charles Eyes," Captain Moss, and landed in Liverpool in the year 1841. The extraordinary price realised by this cargo stimulated other parties to make application to the Peruvian Government for obtaining a contract. The first party who obtained a contract were not allowed to carry it out, although I believe it was drawn up, signed, sealed, and delivered in due form, as

the Government discovered that they had made a bad bargain, and brought the lever of the old Spanish law of "lesion enorme" to bear upon it, by which it was declared annulled, and a new contract was made with Messrs. Quiros and Allier, on much better terms for the Government. Large quantities were sent from the Chincha Island, and the British farmers not yet being practically aware of its fertilising qualities, the market became overstocked, and the bills drawn against the cargoes were returned to Lima protested. The cargoes were ultimately sold at a great sacrifice, and thus the means of its introduction were brought about, to the ultimate advantage of all parties. In the meantime, before this disastrous intelligence had reached the coast, and when the shipment of the article was going on pretty briskly, the farmers of Ariquipa began to be fearful that their stock of guano might become exhausted, and sent a deputy to Lima to expostulate with the Government, when Señor Villa was sent to survey the Chincha group, and gave in an estimate (as I was informed) of from 40 to 50 millions of tons existing on these islands. I examined this group myself in 1844, and estimated the quantity remaining on the northern island alone at 10 millions of tons, although it had been worked by the Indians from time immemorial, and a large quantity had been shipped to Europe, besides the immense amount that had been used by the Peruvian farmers since the conquest. At this time the cliff of pure guano lying in a north-west and south-east direction, where it had been worked in upon from the north-west edge of the rocky basement towards the middle ridge of the island, I measured to be 85 feet perpendicular; and I made a calculation, according to the declivity of the hill, that by the time the workings reached the highest part of its summit, the "varanca," or cliff of guano, would be 100 feet in depth to the basement. I did not examine the two islands to the southward, merely landing upon them, as their deposits at that time had not been touched; I, however, considered that the supply upon these, and other islands and points of land discovered by me, might be said to be inexhaustible, at least to the present generation; in which opinion Señor Don Francesco de Rivera, the late chargé d'affairs of Peru in London, who was entrusted with my plans and estimates of the new guaneros discovered by me, as I was informed, quite coincided. This gentleman made a regular survey of the Chincha group, and found, by boring, that valleys existed 120 feet in depth in some parts of the islands. I am, therefore, of opinion, with all due deference to Admiral Moresby's report, that Mr. M'Intosh may be mistaken in his calculations; for without a boring rod, and partitioning off the general surface of the islands, bestowing likewise much care and time, aided by proper instruments, in the calculation, it must be very difficult to arrive at correct sections in every part.

However, independent of these immense deposits on the Chincha group, the Lobos, Guanape, Huaura, and other islands upon the north-west coast of Peru, were estimated by me to contain some five millions of tons, whilst the Pavillion de Pica, Chipana, the Huanillos, Punta Lobus, Punta Coles, Santa Rosa, and other known guaneros on the south-west coast, contain some eight or nine millions of tons more; therefore the holders of Peruvian Bonds need be under no apprehension of their guarantee falling short, whilst the demand for this invaluable manure continues, as I firmly believe, with Señores Villa and Rivera, that it is practically inexhaustible to the present generation. I am, sir, your obedient servant, *Geo. Peacock, F.R.G.S., formerly Marine Superintendent of the Pacific Steam Navigation Company in the Pacific.*

Home Correspondence.

Royal Agricultural Society's Meeting, Feb. 8.—I request you will allow me to correct the report in your Paper of an observation made by me at the weekly Council of the Royal Agricultural Society on Feb. 8, as it might otherwise lead the farmers in the north to think that I had made an incorrect statement. I did not say that the farmers of Scotland never purchased oilcake without having had it analysed, which would have been absurd; but, in reference to "cheap" articles, offered for sale by parties in whom they had not implicit confidence, the farmers had the same means of guarding against trickery in oilcake as in guano, viz., chemical analysis, by the aid of which the sale of adulterated guano had been very nearly put an end to in Scotland. *James Cairdl, 9, Little Ryder Street, St. James's, Feb. 11.*

Dutch Barns.—I happen practically to know that those buildings possess great advantages. In the wet summer of last year (1853), the immense benefit of these barns was fully tested and appreciated by their fortunate possessors. Tons of hay were spoilt in different parts of the country from the want of proper thatching in the rick-yards, indeed it was almost impossible to get hay in good condition this summer; in a good substantial hay barn, built with brick pillars, and a tile roof, you have always at hand the best and most lasting thatch possible. There is no uncovering a half-finished stack, or pulling off wet thatch some doubtful afternoon, to allow another cart-load of hay to be added to the sweating mass below, and often before half the load was "teamed," down came the rain in a torrent; on the other hand, drive your cart up to the side of your Dutch barn, throw a cloth over the top, and when the storm is over, team the load into your barn. I have been accustomed to see the hay off 50 acres housed in this way for upwards of 20 years, and I have no doubt the original expense of the barn has been paid over and over again in the one item of thatch saved, alone. Another great advantage, the hay can be trussed in any weather. *A Tenant Farmer.*

Stoppage of Drains.—The substance which "J. P." found at the outlet of his drain was in all probability an accumulation of the roots of Mangold Wurzel or Turnip, which had found their way into the smaller drains (round the inside of which they form a sort of net-work), and after becoming detached from the side of the pipes were washed down to and stopped by the iron grating which "J. P." had placed at the end of his drain. *R. C.* [We have many other instances corroborating this idea presented us by our correspondents.]

Profitableness of Cattle Feeding.—In reply to the queries of your correspondent "Z.," I beg to suggest that he again peruse my statement of the 24th Dec. I then attempted, and I think succeeded in showing that it was not advantageous to supply more than a moderate quantity of extra food for fattening. In one experiment 4 lbs. of Rape-cake and 2 lbs. of Bean-meal were supplied during October, November, and to the 20th December; from this time to the close of January, 3 lbs. in addition of Rape-cake, rich in nitrogen and in oil, were given, without any perceptible increase in the gain of weight, but with a marked effect on the richness of the manure, as shown by analysis also. I now beg to correct a gross mistake "Z." has made, in introducing 35½ trusses of hay at a cost of 80*s.* per ton into my materials. My fattening cattle are not supplied with a single pound of valuable hay. On referring to my tabular statement, it will be observed that for bulky food, besides Turnips, shells of Oats or rough seeds (of which I purchase a sack of 80 lbs., at from 4*d.* to 6*d.*, from the miller in my neighbourhood), and 7 lbs. of inferior hay were used. This consists of the gathering at hay time of the discoloured and inferior portions of hay from 15 acres of meadow, together with what is collected from amongst trees, &c. I cannot better define my estimate of its value than by stating I prefer, and use to a much greater extent, the like weight of Oat straw, which I purchase at 1*s.* 8*d.* to 1*s.* 9*d.* per cwt., equal to 33*s.* 4*d.* to 35*s.* per ton. In place of "Z.'s" item for hay, 3*l.* 18*s.* 5*d.*, I beg to substitute for rough seeds and inferior hay supplied for 10 beasts during one week, the very different sum of 10*s.* 2½*d.* Taking "Z.'s" estimate of Turnips at 12*s.* per ton, and his other calculations, the comparison will be for—

Mr. M'Culloch's treatment					£3 9 9
Mr. Hope's do.					£4 0 0
	£	*s.*	*d.*		
"Y.'s, on his own Turnips ...	1	2	6	}	
Seeds and straw	0	10	2½	} together	£2 13 1½
4 lbs. Rape-cake, & 2 lbs. Bean-meal	1	0	5	}	
"Z.'s," according to his own showing					£5 0 11

Now Mr. M'Culloch estimates the value of Turnips at 6*s.* per ton, whilst "Z." computes them at double the price, namely, 12*s.* per ton; a difference which will materially affect the comparison. As Mr. M'Culloch's treatment has been so prominently noticed, I beg to offer a few remarks on it. From the statement published, it appears that the gain per week on the whole 65 under treatment, is only 6 lbs. each of beef, equal to 10½ lbs. gross. Now, I have no hesitation in saying, that since I began the practice of weighing my fattening stock—a practice which I strongly recommend once per month, early in the morning before meal-time—I cannot call to mind, or find in my note-book, an instance of any lot of cattle when once fairly started, and under regular treatment for fattening, not having shown a decidedly greater gain in some instances; and for a length of time I have reached 15 lbs. gross per week on the average, and I do not feel satisfied if I do not average nearly 14 lbs. per week each. Mr. Hope, with an additional quantity of Turnips as compared with Mr. M'Culloch, shows a gain of 13¾ lbs. each per week. *Y.*

What has Science done for Agriculture?—All the letters of the alphabet, birds of prey, and numerous other signatures, real and assumed, are ready, doubtless, at a moment's warning, to rush into print and give crushing answers in the columns of the *Agricultural Gazette.* A storm of ridicule, inuendo, and invective will howl round the head of the unhappy wight who has the hardihood to put this question to the enlightened agricultural mind of 1854. Fairly and softly, good gentlemen all. I know, right well, everything that you are ready to advance, and I entirely agree with you. There is, however, something more besides. Pray tell also, all that *that which men call science* has done for agriculture. How often she has misled her erring, ignorant, and somewhat stolid sister; how often she has acted the part of the blind leader of the blind; and how often science and agriculture may have been found floundering in the ditch together. A full, fair, and complete, answer should embrace everything. I am not, however, about to answer the question. Let bygones be bygones. Not but what science is often somewhat overbearing and dogmatic in her teaching, but let us peaceably take the kicks along with the half-pence and be thankful. I have ever meekly sate at the feet of the scientific Gamaliels. I have pledged myself to Parkes, I have sworn by Liebig, I have listened to Way, I have abided by Morton, I have followed Johnson, Stephens, and others in many matters. How often I have had to modify my borrowed views; how often practice has confuted theory; how often my guides said there was light when I found none, it boots not here to tell. No doubt I have been often wrong; but then I have been sometimes right; and, upon the whole, advancing. On some matters I entertained wholesome doubts, perhaps; but of one thing, at least, I was absolutely certain. It seemed so simply beautifully true, that manure should be so managed that it should retain its ammonia, that I guarded my ammonia as jealously as an Australian gold-digger watches his nuggets. I read, I learned, I practised; I roofed in my manure heap. So far I did well; but I did more. In humble deference to my scientific preceptors, I most carefully prevented all contact of lime with muck. I should as soon have let the burglar into my pantry, as have trusted "the mother of meal" to the solicitations of this busy spoiler. Some weeks ago, my bailiff (a Scotchman) had thrown some lime upon the muck heap; I ordered it to be removed forthwith. Some months ago I found a tenant absolutely in the act of mixing (*horribile dictu*) a quantity of lime with some capital fresh dung. On each occasion, big with science, I lectured learnedly. I said that lime and ammonia were two great incompatibles; that their antipathy for each other was so great that if lime even touched dung, its ammonia would at once be dispelled into empty air. I talked about "tea and tea leaves," and all that sort of thing, in the most approved fashion. The Scotchman said that he had seen the practice followed in his own country, and always with advantage. The Yorkshireman scratched his head and grinned, and replied that he had done so "mony a time afore and it had answered weel." Of course I believed neither, and on each occasion walked away filled with comfortable thoughts about my own enlightened superiority. The result of it all was that the bailiff removed the erring lime, and the farmer doubled his heap of the abominably unscientific mixture. Now who was right, the men of practice or the man of books? A few days ago I received the last number (xxxii.) of the "Journal of the Royal Agricultural Society of England," I find that science and I have been together in the ditch again. The thing that I had myself so carefully avoided, and so majestically reproved in others, is the right thing after all. It is clear that I must shut up, as people say; how can I ever face my bailiff or my tenant again? It seems now that we ought to mix lime with dung. Though the practice has been hitherto "decidedly blamed"—none more so; it had all along been "forgotten that in fresh dung the ammonia is not yet formed," and that "the undeveloped nitrogenous matter may be most effectually fixed by lime." This is told us by the president himself in an article on nitrate of soda as manure, p. 381. "It was forgetten," says Mr. Pusey. Forgotten (!!) what else has been or is "forgotten?" When men of science forget a fact like this, the very basis too of a dogmatic assertion, who can trust their teaching? I believe Mr. Pusey is right. His whole article is most valuable. It has solved many difficulties, which I could not understand, in practice. I never should have arrived at their solution. Science—false science rather let me call it, I have the greatest reverence for the true—had blinded me. I had eyes, yet I could not see. Hundreds now, perhaps, have been similarly blinded. Let us at all events have no more of such careless blunders of forgetfulness; and let scientific men treasure in their memories the warning with which Mr. Pusey follows up the announcement of the "forgotten" fact. "So cautious must we be in drawing chemical inferences for farmers without careful and direct experiment." *A Farming Landowner.* [It is well to be as "cautious" in correcting inferences as in "drawing" them.]

Root Graters.—Having seen some inquiries in the *Agri. Gazette* about a machine professing to reduce Turnips, &c., to pulp, I beg to state that I have received printed particulars of such a machine, accompanied by an account of some experiments showing the economical results of its application, by some person in Ireland. I have for years considered a machine that would reduce roots to a pulp a great desideratum, and I have often mentioned this to the implement-makers. I wrote immediately to an implement-maker who had this machine for sale to order one, if he considered it thoroughly accomplished what it professed. He wrote in reply that he had a favourable opinion of the machine, of which he had sold several, and that it cut Turnips into ribands. I wrote in reply that I had long used Moody's machine, now made by Carson, of Warminster, which cut roots most successfully into thin ribands, which was a great improvement on the old cutters, as admitting of a more thorough incorporation with chaff; and that, as the Irish machine was put forward as a pulping implement, I had assumed that it performed that operation, but that if it merely cut ribands, he need not send one, as Moody's accomplished that to perfection. None has been sent. I send this notice, therefore, for the benefit of inquirers in the *Agri. Gazette*, that they who really want that which I do (a pulping-machine) should not lay out their money on a riband cutter; and that, if they desire the latter, it is but fair that Mr. Carson should have the advantage of the prior invention, which answers the professed end, and is sold at a moderate price. *An Advocate for Pulp.*

Gorse Cover.—Your correspondent "Venator" would, I have no doubt, make a good cover by the plan he suggests; but as I have been very successful with much less trouble, I am glad to give "Fox" the benefit of my experience. Early in May 1847, I determined to make a Gorse cover. The field was then growing Wheat, had not been fallowed for five or six years, tolerably strong clay, some twitch in it, and not well drained. I merely sowed about 10 lb. per acre of Gorse seed among the growing Wheat, harrowed and rolled it. The Wheat was cut with the sickle, and the stubble left tolerably high. In two years it held a fox; in three years hounds

were in it an hour before finding, although four foxes afterwards went away, and the quantity of ground less than seven acres. *Richard Milward, Thurgarton Priory, Notts.*

Sang's Platometer.—After the surveyor has drawn out a map, there still remains the labour of discovering the contents of the enclosures, which involves a good deal of tedious calculation, requiring some skill, and in order to insure accuracy, great attention. A simple machine invented by Mr. Sang, of Kirkaldy, which reduces this work to the mechanical process of leading a pen round the boundaries of the figures on the map, was shown in the Great Exhibition. Although wearing into use, this invention is perhaps unknown to many of our readers interested in this department of rural affairs, and a description of it may not be uninteresting. The instrument consists of a cone about 7 inches long, attached by an axle to two rollers. The rollers serve as wheels on which the instrument moves forwards or backwards over the map; their pivots carry a frame which allows a small index wheel to slide along the surface of the cone from end to end. A tracing point is attached to the frame of the index wheel and forms the handle, by means of which the instrument is guided over the map. When the machine is pushed forward the revolving motion of the rollers is imparted to the index wheel, but the extent of the motion depends on the diameter of that part of the cone with which the index wheel happens to be in contact. The motion is smaller when the wheel is near the small end, and greater when it is near the great end, and is always exactly in proportion to its distance from the small end of the cone. The sliding of the wheel along the cone has thus the effect of the arithmetical process of multiplication. When the tracer is moved forward, the revolving motion communicated to the index wheel is forward or additive; when it is drawn backward, the motion communicated to the index wheel is backward or subtractive; so that in effect, by the simple machinery of the cone and index wheel, the tracer as it is led along by the hand, is effecting the arithmetical processes of multiplication, addition, and subtraction. It is not difficult to understand, by reference to the woodcut, how this process has the effect of telling the area of a figure, if we would imagine it to be covered by a multitude of hairs stretched across it like the parallel lines representing the sky in an engraving, and consider the action of the machine as the tracer crosses one of them. As the tracer passes over one end, the index wheel is moved forward a space equal to the breadth of the hair multiplied by its distance from the apex of the cone; when, in the course of its journey round the outline of the figure, it passes over the opposite end, the index wheel is moved backwards a space equal to the breadth of the hair multiplied by its distance from the apex of the cone; so that with regard to that minute part of the figure, the effective motion of the index is just the difference of the two spaces, that is to say, the real space which the air would have occupied on the figure; and as the same thing would happen with regard to all the hair-breadths into which we have imagined the figure to be divided, the result when the tracer is completely carried round the boundary is exactly the total area of the figure, no matter how many curves or irregularities the boundary may have. The tracer is attached to the frame by a universal joint, so that it is managed by the hand with the same freedom as a common writing pen, and the complicated work of calculating the area of even the most irregular figure is thus reduced to the simple operation of leading a pen along the boundary line, which may be done very accurately and quickly. By means of a reading glass attached to the instrument, and always ready in focus, the indications are read off on the graduated silver ring forming the rim of the index wheel. The divisions may be made so as to give acres to any given scale; in practice it has, however, been found most convenient to arrange the graduations so that they give square inches, tenths and hundredth parts of inches, as by this means the instrument may be applied to all maps alike. The square inches are converted into acres in the usual way, by reference to the scale on which the map is constructed.

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

February 15. — Weekly Council. — Mr. Pusey, President, in the chair.

Guano Deputation.—The President reported to the Council the result of an interview which the Earl of Clarendon granted, on the 10th December last, to a deputation from the Council. His lordship had given every assurance to the deputation on that occasion that no effort should be spared by her Majesty's Government, either in effecting if possible a reduction in price or on the other hand of increasing the supply by the discovery of further deposits of that valuable manure in different parts of the world, or of the nitrate of soda along the coast of Peru, Bolivia, and Mexico, ascertaining in each case the quality as well as the amount of such deposits. The President stated that Admiral Moresby, in his survey of the guano beds, had taken the quality of the deposit into account in stating the amount of guano suitable for export to England, while the Peruvian surveyor had not drawn this distinction; a circumstance that might explain satisfactorily the different estimates they had given of the amount of guano still remaining on hand and at the disposal of the Peruvian Government. There was a great difference in the quality of the different guanos, in reference to their respective proportions of ammonia on the one hand, and of the phosphates on the other; and their different market values were affected accordingly. He concluded that the farmers of this country would not be put off their guard by the recent manifesto of the Peruvian Government. — The Duke of Richmond fully concurred with the observation made by Mr. Fisher Hobbs at a recent meeting of the Council, that it would be advantageous for the farmers of this country to purchase their guano of the Americans. They, it appeared, knew how to buy guano, and could get from the Peruvian Government any quantity of guano they pleased.—The President considered that there was nothing in law to prevent the importation of guano into this country from America. Both he and the Duke of Richmond were fully prepared to try the question by purchasing jointly a cargo of guano at New York, which should be consigned to them at some British port.—Mr. Caird referred to the result of American negotiation with the Peruvian Government. He stated that the discovery of bird-manure, made a short time ago on the eastern coast of Africa, had been previously made by a Government surveyor 10 years ago, but the fact had lain neglected till the recent re-discovery of the very same deposit. He then referred to that other valuable manure, the nitrate of soda, of which the nature and mode of action had been so well expounded by Mr. Pusey. He concluded by hoping that the Society would lose no opportunity of pressing upon the Government the importance of decided measures on the guano question.—The Duke of Richmond asked why the second discoverers of the guano on the eastern coast of Africa had not gone at once to the merchants rather than to the Government.—Mr. Caird replied, that such had been the case on the discovery of guano on the Ichaboe island, and the consequence was that the merchants who undertook the speculation were ruined by it, in consequence of the immense outlay of their preparations for the trade, which were rendered nugatory by the simultaneous efforts of rival merchants. —The Duke of Richmond thought the farmers of this country had now a strong claim; they wished to buy guano; there was only one house in this country that had the privilege of supplying it, and that house announced that the supply, for an indefinite term, had ceased.—Mr. Slaney had no doubt that the time was gradually approaching when such a substitute for guano would be found within our own resources, as to render us independent of the necessity of a foreign importation.—The President agreed with Mr. Slaney, but thought we had better first get the guano.—Mr. F. Hobbs gave notice that he should move at the next monthly Council that the Guano Committee of the Society be requested to meet for the purpose of deliberating on the interesting position of the quano question at that moment; he should also at that time move that Mr. Caird should allow his name to be added to the list of the committee.

Economical Bread.—The Hon. H. Fitzroy, M.P., transmitted, by direction of Viscount Palmerston, a communication addressed to his lordship by an anonymous correspondent at Calais, on the subject of the economical preparation of bread. This communication contained two modes of effecting this object:—1. By using bran-water instead of plain water in mixing the dough. 2. By mixing with the dough a certain proportion of mashed white Turnips.*

Soil-tester.—Mr. Fisher Hobbs exhibited to the Council a light steel auger, adapted for the double purpose of drawing up with ease at various depths specimens of the soil, and of serving as a light strong walking-staff. It had been made for Mr. Hobbs by Messrs. Burgess and Key, from the original one brought over to this country by Captain Edman, from Sweden, where it was in common use. Its peculiar point and its concavity of shaft, enabled it by a single turn on its axis, after insertion in the land, to bring up the soil, at given distances within its range, as marked by divisions on its stem, in an unmixed state.

A Special Council was then held.

Implements.—Colonel Challoner, chairman of the Implement Committee, having submitted to the Council the report of that committee, the Council decided to offer the following prizes for agricultural implements and machinery at the Lincoln meeting:

Plough for general purposes	£5	Portable threshing machine, 8-horse	£20
Plough for not less than 10 inches deep	5	Fixed threshing machine, 8-horse (to prepare for market)	20
Drain pipe and tile machine	5	Reaping machine	20
Cultivator, grubber, and scarifier	5	Corn dressing machine	5
Drill for general purposes	10	Grinding mill (to meal)	5
Corn and seed drill	10	Linseed and corn-crusher	5
Drill for small occupations	5	Chaff-cutter, horse or steam power	5
Seed and manure drill for small occupations	5	Chaff-cutter, hand-power	3
Turnip drill on the flat, with manure	5	Turnip-cutter	3
Turnip drill on the ridge, with manure	5	Machine to reduce roots to a pulp	3
Liquid manure or water drill	5	Oilcake breaker	5
Manure distributor	10	Bone mill	5
Horse-hoe on the flat	5	Churn	3
Horse-hoe for setting out and thinning Turnips	5	Essential improvements (Medals)	21
Portable steam-engine, 8-ho.	20	Invention of any new Implement (such sum as the Council may decide)	
Second-best do. do.	10	Mr. Slaney's offer of a prize for plough to fill-in the soil cast out of drains	10
Fixed steam-engine, 10-horse	20		
Second-best do. do.	10		
Portable threshing machine, 6-horse	10		

The Council adopted the suggestion of Mr. Evelyn Denison, M.P., to offer a prize to encourage the application of steam power to the cultivation of the soil; and they agreed to the following terms of such prize:—

"That the Society offer a prize of 200*l.* for the steam-cultivator which shall in the most efficient manner turn the soil, and be an economical substitute for the plough or the spade. This prize to be competed for on or after the year 1855."

The Council also resolved that at the Lincoln meeting the public should be admitted, under special regulations, to view the trials in the implement yard, commencing on and after the Thursday in the week preceding that of the show.

The Council then decided on the conditions of the prizes for implements, and the general regulations of that department, at the Lincoln meeting, and ordered the completion and publication of the prize-sheet accordingly. Special clauses were introduced:—1, for the purpose of rendering the trial of the steam-engines more complete and satisfactory to all parties; 2, for enforcing the regulation requiring exhibitors to execute all orders given them in the yard at the selling price stated in their certificates, which lowest selling price has a just weight with the judges in determining the relative claims of nearly-balanced competing implements; 3, for requiring the consent of the stewards to be obtained by the judges in awarding medals for essential improvements; and 4, for requiring that all certificates, either for live stock or implements, must be properly filled up and lodged at the Secretary's office in Hanover Square, by the last day allowed in each case for the reception, otherwise they cannot under any circumstances be received.

Wool.—The Council having accepted the offer of prizes to the amount of 35*l.* for long wool, made to the Society by the Local Committee at Lincoln, the following arrangements for such prizes was adopted:—

Prizes of 10*l.*, 6*l.*, and 4*l.*, for wool of hogget sheep; prizes of 7*l.*, 5*l.*, and 3*l.*, for wool of sheep of greater age; five fleeces of wool in each case to be shown, being the produce of one flock, and grown by the respective exhibitors; quality and quantity being taken into consideration. The Council adopted the suggestion of the general Lincoln Committee, that it would be desirable, if found convenient, that a wool-sorter should be requested to select from one of the prize fleeces the several samples that would show its different qualities.

Farm-Poultry.—The Council adopted the report of the Farm-Poultry Committee on the prizes amounting to 110*l.*, and directed that the live-stock prize-sheet of the Society for the Lincoln Meeting should then be completed, and published in the usual course.

Adjourned to the 22d inst., when substitutes for guano would form the subject of consideration.

* We must postpone a reference to this subject till next week.

Notices of Books.

The Culture of the Mangold Wurzel or Field Beet. E. F. Collins, *Advertiser* Office, Hull.—A very satisfactory and seasonable tract on the subject to which it relates. Mangold Wurzel is every year being more generally grown; it is more easy to obtain 30 tons per acre of it in south and central England, than it is to get 20 tons of Swedes. And though a ton of good Swedes may be more valuable in winter than a ton of good Mangold, it is not so valuable in spring and early summer, up till which time the latter keeps good, when the former is worthless. *At any time* too, 30 tons of Mangold are better than 20 of Swedes; and as the crop is thus rapidly extending, we are glad to have it in our power to refer to a simple and sufficient account of its cultivation.

The Scottish Agriculturist's Almanac. By J. L. Morton. A. and C. Black, Edinburgh.

It seems very well adapted for the instruction and use of agriculturists in England and Ireland as well as Scotland. Beside the usual features of an almanac, it contains calendarial notices of an agricultural character —and extracts from journals and publications on agriculture which keep its reader pretty well satisfied with the truthfulness of its second title "Year Book of Farm Progress." And besides the usual feature of an agricultural almanac, it possesses, interleaved with its monthly portions, blank and ruled pages adapted for use as a market and memorandum book: and to fit it for pocket use in this way, it is bound in a stiff covering.

Poultry.

Arabian Pigeons.—In a late number of your Paper, in answer to your correspondent "Durham," you say that you do not know the Arabian pigeon. I a few months ago had a pair given to me; they were brought from Aden, in Arabia, by a Captain Morrison. They are larger than our tumbler pigeon, a clear white, feathered legs even to the end of the toes, with the feathers on the back of the head turned up, similar to our English turn-caps, and of a beautiful form and carriage. *J. E.*

Poultry: *C P.* In judging Cochin China Fowls, the outer colour is the point with which the judges have to do. If a case arose where every other point was equal, which of late never happens, I hardly think, even then, the judges would be justified in making the under colour a point of decision, as they have to judge the birds on their present merits, and not looking into the future for their probable produce. If I wished to breed light birds, I would prefer those without dark under-feathers; but it is undeniable that all have more or less of dark blood in them, and also that the old fashioned dark birds were heavier and more symmetrical than the light ones now in favour. The ridiculous stickling for uniform colour, and clear hackle, has robbed this year's birds of the qualities formerly found in them, as regards weight and shape, and has been the cause of so many prizes being withheld.—*Maidstone.* Clean-legged game bantams are the best for gold pheasants' eggs, as they are light, and the shells of the eggs are delicate; an ordinary game hen is the best for silver eggs, as they are stronger in the shell and a larger egg.—*White Abbey.* The twist in the tail of a fowl is generally the result of a curve or deformity in the back bone; but it is sometimes the case where no apparent cause accounts for it. I have known it to proceed from long confinement in a small basket or coop, which would not admit of the tail being properly carried; a very slight injury will cause it.—*Amateur.* Moonies are famous layers and average sitters, but not very good mothers. They lay a great many eggs before they sit; indeed, laying is their *forte*. Oatmeal is the best food for fowls. I do not think the gold Polands hardy; they are very good layers, but, like the Moonies, only average sitters. *J. Baily*, 113, *Mount Street.*

Calendar of Operations.

FEBRUARY.

Cheshire, *Feb.* 8.—The last fortnight of fine weather has in a great measure relieved the minds of the farmers as to their late sown Wheats. From the severity of the weather about Christmas, and the consequent tardiness of the young plant in making its appearance above ground, many were apprehensive that it had been seriously injured, and that it would prove very thin. In some few cases these fears may have been realised, but generally speaking the young Wheats are doing well, and some farmers are now sowing their Turnip land in the finest condition. The frost has left the land in a nice friable state, and if we have not too much wet this month, it may yet do very well. Ploughing is progressing very rapidly, so that it is probable we may have an early spring seed time. Turnips, generally speaking, are keeping well, but the bulbs being small, and Mangold Wurzel also being very light, it is to be feared these root crops will be exhausted at an earlier period than usual; indeed, there is a strong indication of it from the fact that most of the annual sales of fat stock are

fixed for a month earlier than the last and previous years. The Green Melon Turnip, sown late in the season, has kept fresh and nutritious in the ground throughout the winter, thus proving it is valuable both for cattle and culinary purposes. Potatoes are very scarce and dear, and many families do not introduce them at table; this deprivation is severely felt by the poor. Some farmers intend adopting the old system of planting their Potatoes on "butts" or ridges of 4 feet wide, instead of in drills, it being supposed that they are less liable to disease when planted on high "butts" or ridges, and kept dry. The pleuro-pneumonia is not so prevalent as last year, and, generally speaking, the dairy stocks continue healthy, and (as the calving season is at hand), are beginning to be fed on hay with a few Turnips or Mangold Wurzel. It is to be regretted that the latter root is not more cultivated for milking cows, and more attention paid to its cultivation, in order to procure good crops and perfect health, which, in some measure, may be attained by paying a little more regard to the selection of the seed. The Mangold is decidedly the most useful root we have for general purposes, for not only cattle but pigs, sheep, poultry, and even horses are fond of and thrive well upon it. Sheep are doing better than they did the last month, from a favourable change in the weather, but in some instances they have a slight eruption of the skin, which causes an itching and consequent plucking of their wool. We have found the following recipe very efficacious. The quantity of dressing for eight sheep is as follows:—Dissolve 1 lb. of soft soap in 1 gallon of good tobacco water, which is done by boiling; then measure out a pint of it, and put a small wine-glassful of spirits of tar in it, after which stir it well and it is fit for use. So in this proportion, 5 lbs. of soap, 5 gallons of tobacco water, and the wine-glassful of spirits of tar to each pint, will dress 40 sheep. The last ingredient should not be mixed in large quantities like the tobacco water and soft soap, but only used just as it is wanted. A pint is considered quite sufficient for one sheep. The wool should be opened in ridges along the sides, about the head and underneath the body of the animal, and while one person is doing this another should pour the dressing in. *W. P.*

WESTER ROSS.—As one of the effects of the severity of the winter, late-sown Wheat had scarcely got above ground in January. I had 20 acres sown about the 26th Nov., and after lying full two months in the ground, the probability is that a proportion of the seed will have perished, and consequently the braird will be deficient. A favourable spring, however, would make up this deficiency. Whilst agriculturists in the south are busying themselves testing the capabilities of implements, which profess themselves to be highly advantageous supplanters of our old friend the plough, the farmers in the north are advertising their ploughing-matches, and holding out to farm-servants, as encouragements to proficiency in the art of ploughing, small prizes and high fame. Notwithstanding our affection for the plough, when a more speedy and a more effective implement will be found, and an implement that will do its work more cheaply, we will hesitate not to put the old lady on the "baulks." A large number of ships are being loaded with Potatoes in the northern ports just now. Agricultural distress would be no more heard of in this quarter, should that mysterious disease operate in coming years as it did in the bygone one—damaging the Potatoes in all quarters more or less, save those of the Highlands.

WEST SUSSEX, *Feb.* 11.—The land is now getting dry, and admits of the harrows working. The sowing of Peas and Beans has commenced, and under the most favourable circumstances. Where we used the skim coulter in ploughing, the benefit has been very perceptible; and where it was not used, the land has got so close upon top, by the action of the frost, that it is more difficult than usual to work. But, upon the whole, the season has been greatly in its favour, and it was in great need of some pulverising influence. The winter Wheat generally looks well, and is quite thick enough upon the ground—perhaps too much so; and there is no doubt but those who seed thin will have things a little their own way, and have again to expatiate upon the evils of thick sowing. The young Clovers have stood the winter well, and promise to come to hand in good time, which will be a great convenience, as Turnips are not plentiful. The lambing has gone on well, and the lambs look strong. Down couples are now in the market, and sell at prices from 48*s.* to 60*s.* per couple. The ewes do not in general appear in high condition, which may be accounted for by the bad hay and scarcity of Turnips, and they have not had many of them before lambing; and to this perhaps is owing the good luck that has attended them. The work will now be the getting in of the remainder of the Peas and Beans; and then Oat sowing will follow, on the heavier lands after Turnips. *G. S.*

Notices to Correspondents.

CREAM: *Farmer's Wife.* It is not the weather directly, but its indirect influence on the quality of the milk that makes cream thin in cold weather. The cows have poorer food, and more of it, probably, is consumed in respiration. The remedy, we suppose, will consist in improving the quality of the food.

EGGS: *R Bosworth.* The directions were given at p. 301, 1853.

GYPSUM: *P M.* Ground plaster of Paris is gypsum, and will serve all the purposes *agriculturally*, which are served by gypsum.

HEMP SEED: *A Nine Years' Sub* would be glad to learn the experience of any one who has used crushed Hemp seed for cattle.

REFUSE FISH: *Tonbridgensis.* We do not know where it is converted into manure. The process hitherto has been rather one of experiment than actual manufacture for sale.

ROT IN SHEEP: *Tenant Farmer.* The probability is your sheep, like many others, are affected with the rot, or cothe. If so you will find *flukes* or *plaice* in the biliary ducts of the liver. The best course to pursue will be to give nutritious food, such as Linseed cake, freely, and a little salt daily with roots and good hay, so as to get them forward for the butcher. *W. C. S.*

SMALL HOMESTEADS: *T M H.* You will find some plans in some of the earlier volumes of the "Edinburgh Quarterly Journal of Agriculture."

SOW: *Erith.* The destruction of her young, which the sow will sometimes eat, is a phenomenon connected with temper rather than with food. She has been excited or disturbed; it is not owing to any deficiency of food.

WIND POWER: *S J.* If you can "always" command wind, there is no objection to its use. But where it used to be much employed it has now long since been abandoned, and we should, in every case of which we have any knowledge, greatly prefer to spend an equal sum on any other kind of power. Perhaps any one who has had experience on the subject may give it to us. The subject is—the cost and merits of wind power for farmyard purposes.

WINTER TARES, &C.: *W P.* Seed sown last November and not yet up, is not likely to appear, but you can look for it and see.—Sow Italian Rye-grass in moist weather early in April.—Milk of lime is a term employed to designate a mixture of fresh slaked lime and water, of about the consistency of cream.—Phosphoric poison kills the rats; we understand it drives them in search of water before it kills them.—We understand the term "round timber" to apply to the felled trees in an unhewn state.

ERRATA. Owing to a mistake we did not last week receive Mr. Bree's corrected proof; the following corrections are necessary. In the 5th line from top, page 90, col. *c*, for "three" read "*these* alkalies," and in the following line for "involved" read "resolved." Three lines lower fill up the space with as "1" to 24. At the end of the next paragraph for "same" read most" soluble salt; and in the last paragraph but one, third line, for "their" cells read "its" cells.

INSTRUCTION IN ART, General and Special, as afforded at the CENTRAL SCHOOL of the DEPARTMENT of SCIENCE and ART, at MARLBOROUGH HOUSE, Pall Mall, London. The School consists of

I. A NORMAL SCHOOL FOR TRAINING TEACHERS.
II. SPECIAL CLASSES FOR TECHNICAL INSTRUCTION.

ART-SUPERINTENDENT—RICHARD REDGRAVE, R.A.

The SPRING SESSION will commence on March 1, and end July 31; and the Fees are for that period.

1. The Courses of Instruction are intended to impart systematically a knowledge of the scientific principles of Art, especially in its relation to the useful purposes of life. A limited application of those principles is demonstrated with the view of preparing Students to enter upon the future practice of the Decorative Arts in Manufactories and Workshops, either as Masters, Overscers, or skilled Workmen. At the same time, instruction is afforded to all who may desire to pursue these studies without reference to a preparation for any Special Branch of Industry. Special Courses are arranged in order to train persons to become Masters of Schools of Art, and to enable Schoolmasters of Parochial and other Schools to teach Elementary Drawing as a part of general Education concurrently with Writing.

2. The Lectures and Courses of Instruction are as follows:—

GENERAL COURSE FOR MALE STUDENTS ONLY.

A. Freehand, Model, and Elementary Mechanical Drawing, Practical Geometry and Perspective, Painting in Oil, Tempera, and Water Colours. Modelling. The Classes for Drawing, Painting, and Modelling, include the Figure from the Antique and the Life; and Artistic Anatomy. Lectures, Teaching and Practice, in the Morning and Evening. Fee, 4*l.* the Session.—Head Master, Mr. Burchett; Assistants, Messrs. Herman, Welsh, Danby, Wills, and Hancock.

B. The Evening Instruction is limited to advanced Drawing, Painting, and Modelling, including the Figure. Fee, 2*l.*

TECHNICAL COURSES.

C. Practical Construction, including Architecture, Building, and the various processes of Plastic Decoration, Furniture, and Metal Working. Lectures, Teaching, and Practice, Morning and Evening. Fee, 4*l.* Evening Course only. Fee, 2*l.* for Male Students only. Superintendent, Professor Semper.

D. Mechanical and Machine Drawing, Class Lectures with Evening Teaching and Morning Practice. For Male Students only. Fee, 2*l.* Superintendent, Mr. W. Binns.

E. Surface Decoration, as applied to Woven Fabrics of all kinds, Lace, Paper Hangings, &c. Lectures, Teaching and Practice, Morning and Evening. Fee, 4*l.* An Afternoon Class for Females only. Fee, 2*l.* An Evening Class for Male Students only. Fee, 2*l.* Superintendent, Mr. Octavius Hudson.

F. Porcelain Painting, daily Teaching and Practice for Male and Female Students. Fee, 4*l.* Superintendents, Mr. Simpson and Mr. Hudson.

G. Wood Engraving, Lectures, Daily Teaching and Practice for Female Students only. Fee, 2*l.* Superintendents, Mr. Thompson and Miss Waterhouse.

H. Lithography, Chalk, Pen, and Colour. Daily Teaching and Practice for Female Students only. Fee, 4*l.* Superintendents, Mr. Brooks and Miss Channon.

PUBLIC LECTURES.

On the Forms and Colours of the Animal and Vegetable Kingdoms, by Professor E. Forbes; on the Human Form, by Mr. J. Marshall, F.R.C.S.; on the History of Ornamental Art, by Mr. Wornum, &c. Admission to each Lecture, 6*d.*

3. The Instruction for the general Students is carried on daily, except on Saturdays.

4. Students may matriculate for a period of three years upon paying 20*l.* in one sum on entrance, or three annual payments of 10*l.* They are entitled to attend all Public and Class Lectures, the general and technical Courses, to receive personal instruction, and to practise in the School at all times; they have also access to the Museum and Library. At the end of the Session they may pass an Examination, and have the privilege of competing for Scholarships, varying from 10*l.* to 30*l.* a year in value.

5. Occasional Students are at liberty to attend only the particular Courses for which they enter, and have admission to the Museum, Library, and Public Lectures.

6. A CLASS FOR SCHOOLMASTERS AND PUPIL TEACHERS will meet every Tuesday and Thursday Evenings, and on Saturdays. Fee, 5*s.* Superintendent of the Training Teaching, and Elementary Instruction, Mr. Burchett; Assistant, Mr. Bowler; also at Gore House, Kensington, on Mondays and Thursdays.

7. A Register of the Students' attendances is kept, and may be consulted by Parents and Guardians.

8. THE SCHOOL FOR THE FEMALE STUDENTS passing through the General Course is at 37, Gower Street. Superintendent, Mrs. M'Ian; Assistants, Miss Gann and Miss West.

Fees, Advanced Classes, 2*l.* and 4*l.*; Elementary Class, 20*s.*; Evening Class, 10*s.*

A Class meets at Gore House, Kensington, on Mondays, Wednesdays, and Fridays.

9. DISTRICT SCHOOLS OF ART, in connection with the Department, are now established in the following places. Open every Evening (except Saturday) from 7 to 9.30. Entrance Fee, 2*s.* Admission 2*s.* and 3*s.* per month. The instruction comprises Practical Geometry and Perspective, Free-hand and Mechanical Drawing, and Elementary Colour:—

1. Spitalfields, Crispin Street.
2. North London, High Street, Camden Town.
3. Finsbury, William Street, Wilmington Square.
4. Westminster, Mechanics' Institute, Great Smith Street.
5. St. Thomas, Charterhouse, Goswell Street
6. Rotherhithe, Grammar School.
7. St. Martin's-in-the-Fields, Long Acre.

At 1, 2, and 5 Schools there are Female Classes. Application for admission to be made at the Offices in each locality.

For further information, apply at Marlborough House, Pall Mall, London.

HENRY COLE, } Joint Secretaries.
LYON PLAYFAIR, }

ANOTHER CURE OF FIFTEEN YEARS' ASTHMA BY DR. LOCOCK'S PULMONIC WAFERS.

"Garden Place, Cheetham Hill.

"GENTLEMEN,—For the last 15 years my wife has been afflicted with severe asthma, and during that time has never been able to obtain more than temporary and partial relief. Since she has taken two boxes of the wafers her cough has left her, and her breathing is now as free as she could wish."—Dr. Locock's Wafers give instant relief and a rapid cure of asthma, cough, and all disorders of the breath and lungs. They have a most pleasant taste. Price 1*s.* 1½*d.*, 2*s.* 9*d.*, and 11*s.* per box. Sold by all druggists.

HOLLOWAY'S PILLS THE GREATEST WONDER OF MODERN TIMES.—They correct bile, prevent flatulency, cleanse the liver, purify the system, renovate the debilitated, strengthen the stomach, increase the appetite, invigorate the nerves, promote health and reinstate the weak to an ardour of feeling never before experienced. The extraordinary daily sales of these invaluable Pills in all parts of the globe astonish everybody, convincing them that there is no other medicine in existence equal to Holloway's Pills for removing the complaints which are incidental to the human race; they are indeed a blessing to the afflicted—a boon to those who suffer from any disorder, internal or external.—Sold by all Druggists, and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

FENDERS, STOVES, AND FIRE-IRONS.—Buyers of the above are requested, before finally deciding, to visit WILLIAM S. BURTON'S SHOW ROOMS, 39, Oxford Street (corner of Newman Street), Nos. 1 and 2, Newman Street, and 4 and 5, Perry's Place. They are the largest in the world, and contain such an assortment of FENDERS, STOVES, RANGES, FIRE-IRONS, and GENERAL IRONMONGERY as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright Stoves, with bronzed ornaments and two sets of bars, 2*l.* 14*s.* to 5*l.* 10*s.*; ditto with ormolu ornaments and two sets of bars, 5*l.* 10*s.* to 12*l.* 12*s* Bronzed Fenders complete, with standards, from 7*s.* to 3*l.*; Stee Fenders from 2*l.* 15*s.* to 6*l.*; ditto, with rich ormolu ornaments from 2*l.* 15*s.* to 7*l.* 7*s.*; Fire-irons from 1*s.* 9*d.* the set to 4*l.* 4*s* Sylvester and all other Patent Stoves, with radiating hearth plates All which he is enabled to sell at these very reduced charges,

1st,—From the frequency and extent of his purchases; and,
2dly,—From those purchases being made exclusively for cash.

THE PERFECT SUBSTITUTE for SILVER.—The real NICKEL SILVER, introduced 20 years ago by WILLIAM S. BURTON, when Plated by the patent process of Messrs Elkington & Co., is beyond all comparison the very best article next to sterling silver that can be employed as such, either usefully or ornamentally, as by no possible test can it be distinguished from real silver.

	Fiddle Pattern.	Thread or Brunswick Pattern.	King's Pattern.

CUTLERY WARRANTED.—The most varied assortment of TABLE CUTLERY in the world, all warranted, is on Sale at WILLIAM S. BURTON'S, at prices that are remunerative only because of the largeness of the sales 3½-inch ivory-handled table knives, with high shoulders, 11*s.* per dozen; desserts to match, 10*s.*; if to balance, 1*s.* per dozen extra; carvers, 4*s.* per pair; larger sizes, from 14*s.* 6*d.* to 26*s.* per dozen; extra fine, ivory, 32*s.*; if with silver ferrules, 37*s.* to 50*s.*; white bone table knives, 7*s.* 6*d.* per dozen; desserts, 5*s.* 6*d.*; carvers, 2*s.* 3*d.* per pair; black horn table knives, 7*s.* 4*d.* per dozen; desserts, 6*s.*; carvers, 2*s.* 6*d.*; black wood-handled table knives and forks, 6*s.* per dozen; table steels, from 1*s.* each. The largest stock in existence of plated dessert knives and forks, in cases and otherwise, and of the new plated fish carvers. Also a large assortment of Razors, Penknives, Scissors, &c., of the best quality.

WILLIAM S. BURTON has TEN LARGE SHOW ROOMS (all communicating), exclusive of the shop, devoted solely to the show of GENERAL FURNISHING IRONMONGERY (including Cutlery, Nickel Silver, Plated and Japanned Wares), Iron and Brass Bedsteads, so arranged and classified that purchasers may easily and at once make their selections.

Catalogues, with engravings, sent (per post) free. The money returned for every article not approved of.

No. 39, Oxford Street (corner of Newman Street); Nos. 1 and 2 Newman Street; and 4 and 5, Perry's Place.

THE COTTAGER'S STOVE.—An economical, compact, and portable COOKING APPARATUS, combining a good sized Oven and Hotplate; may be had with or without a boiler, and will cook sufficient for a dozen persons with the consumption of 1 lb. of coal or coke per hour. It requires no fixing, may be placed in any apartment, and is a great security against accidents from fire. It will burn Coal, Coke, or Wood. They are also specially adapted for Emigrants, and may be seen in operation daily, at the Manufacturers', D. & E. BAILEY, 272, High Holborn, London.—Price 50*s.*, and upwards.

GREAT SAVING OF TIME AND MONEY.

R. RESTELL'S PATENT ECONOMICAL GAS APPARATUS for Forcing Houses, Greenhouses, Conservatories, Pits, Shops, Counting Houses, Warehouses, Drying Rooms, &c. &c., possessing all the advantages of Hot Water at half the expense of fitting, and most trifling cost for Gas, far surpassing any ordinary Gas Stove, requiring no furnace, and allowing of no fumes or evaporation in the Building, or possibility of accidents from negligence or carelessness. It has been tested through the late severe weather, on a variety of Plants, and found most satisfactory. It is very quickly fitted up and requires no night attention.—Apply to the Inventor and Patentee, R. RESTELL, 35, High Street, Croydon, Surrey.

Persons wishing to have Houses fitted will please to send the height and dimensions.

NO CHARGE FOR STAMPING ARMS, CRESTS, INITIALS, &c., on paper and envelopes, at LOCKWOOD'S well-known establishment, 75, New Bond Street. Good cream-laid Note-paper, five quires for 9*d.*; Thick ditto, five quires, 1*s.*; Albert and Queen's sizes, five quires for 6*d.*, 9*d.*, and 1*s.*; Envelopes, 3*d.* to 1*s.* 6*d.* per hundred; Foolscap paper, 7*s.* 6*d.* per ream; Copybooks, 2*s.* 6*d.* per dozen. Card Plate engraved, 2*s.* 6*d.*; 100 Cards printed, 2*s.* 6*d.* Mourning Stationery equally cheap. Wedding Orders promptly executed. A large variety of Writing and Dressing Cases, Envelope Boxes, Blotting Books, Inkstands, Gold Pens, Church Services, &c. Copy address, LOCKWOOD'S, 75, New Bond Street. Country orders for 20*s.* sent carriage free.

METCALFE AND CO.'S PERFUMERY DEPARTMENT.—PROPRIETARY ARTICLES.—METCALFE'S celebrated ALKALINE TOOTH POWDER is acknowledged as the safest and most efficient now in use. Dupuytren's Medicated Pomade is the most certain remedy for preventing the hair prematurely falling off, and for restoring it when baldness has already commenced. Dupuytren's Medicated Balm strengthens, cleanses, and improves the growth, and is generally acknowledged as the best wash for the hair.—Manufacturers of British and Importers of Foreign Soaps, Perfumery, and J. M. Farina's genuine Eau de Cologne, at METCALFE, BINGLEY, & Co.'s only Establishment, 130*B* and 131, Oxford Street, second and third doors west from Holles Street.

PARR'S LIFE PILLS are now, from their many virtues, the established Family Medicine throughout the British Empire. PARR'S LIFE PILLS will be found speedily to reanimate the spirits, improve the digestive powers, and restore the whole nervous system to a happy and natural state; the balsamic powers of this medicine produce that delightful feeling of good spirits so very desirable, and disposes both mind and body to healthy exercise—everything under its influence soon wears a joyous aspect, and the varied duties of life are performed with pleasure; and, instead of long and weary nights, gives sound and refreshing sleep. If the stomach and bowels require it, PARR'S LIFE PILLS act as the mildest and most agreeable purgative, and by their cleansing powers totally eradicate a redundancy of bile.—Sold by E. EDWARDS, 67, St. Paul's Churchyard; BARCLAY and SONS, Farringdon Street; SUTTON and Co., Bow Church-yard; HANNAY and Co., and SANGER, Oxford Street, London; and by all respectable Chemists and Medicine Vendors in Town and Country. In boxes, price 1*s.* 1½*d.*, 2*s.* 9*d.*; and in Family Packets, 11*s.* each.—*** None are genuine without the English Government stamp fixed round the sides of each box.

QUANTITY AND QUALITY OF THE HAIR.

NO TOILET can be considered complete without a careful attention to that department which so materially affects the entire contour, viz., the Hair, which, both in quantity and quality, is susceptible of the most material alteration. That which is weak can be strengthened, and be made to receive a most beautiful gloss by artificial applications. It is to its extraordinary and valuable properties in these respects that is due the character of C. AND A. OLDRIDGE'S BALM OF COLUMBIA, for its invigorating, nutritious, and regenerative qualities. OLDRIDGE'S BALM causes Eyebrows to grow, prevents the Hair from turning grey, and the first application causes it to curl beautifully, frees it from scurf, and stops it from falling off. Price 3*s.* 6*d.*, 6*s.*, and 11*s.* per bottle. No other prices are genuine.—N.B. Ask for OLDRIDGE'S BALM, 13, Wellington Street North, Strand, London.

THE SUCCESSFUL RESULTS OF THE LAST HALF CENTURY HAVE PROVED BEYOND QUESTION THAT

ROWLAND'S MACASSAR OIL possesses singularly nourishing powers in the growth, restoration, and improvement of the human Hair, and when every other specific has failed. This celebrated Oil is now universally acknowledged to be the cheapest, and superior to all other preparations for the hair. It prevents it from falling off or turning grey, strengthens weak hair, cleanses it from scurf and dandriff, and makes it beautifully soft, curly, and glossy. Its operation in cases of baldness is peculiarly active; and in the growth of the Beard, Whiskers, Eyebrows, and Moustachios, it is unfailing in its stimulating operation. For children it is especially recommended, as forming the basis of a beautiful head of hair. Price 3*s.* 6*d.* and 7*s.*; Family Bottles (equal to four small), 10*s.* 6*d.*; and double that size, 21*s.* CAUTION.—On the wrapper of each bottle are the words, Rowland's Macassar Oil, in two lines. The same are engraven on the back of the wrapper nearly 1500 times, containing 29,028 letters.—Sold by A. ROWLAND & SONS, 20, Hatton Garden, London, and by Chemists and Perfumers.

PAINS IN THE BACK, GRAVEL, LUMBAGO, RHEUMATISM, GOUT, INDIGESTION, FLATULENCY, NERVOUSNESS, DEBILITY, &c.

DR. DE ROOS' COMPOUND RENAL PILLS, as their name Renal (or the Kidneys) indicates, are a most safe and efficacious remedy for the above dangerous complaints. For depression of spirits, incapacity for society, study, or business, giddiness, drowsiness, nervousness, and insanity itself, when arising from or combined with urinary diseases, they are unequalled. Price 1*s.* 1½*d.*, 2*s.* 9*d.*, 4*s.* 6*d.*, 11*s.*, and 33*s.* per Box, through all Medicine Vendors, or sent (free) on receipt of the amount in postage stamps, by Dr. DE ROOS, 35, Ely Place, Holborn, London. At Home for consultation daily from 11 till 1, and 5 till 8. Sunday excepted. Advice and Medicines, 1*l.*

DINNEFORD'S PURE FLUID MAGNESIA has been for many years sanctioned by the most eminent of the Medical Profession, as an excellent remedy for Acidities, Heartburn, Headache, Gout, and Indigestion. As a mild aperient, it is admirably adapted for delicate females, particularly during pregnancy; and it prevents the food of infants from turning sour during digestion. Combined with the Acidulated Lemon Syrup, it forms an Effervescing Aperient Draught, which is highly agreeable and efficacious.—Prepared by DINNEFORD & Co., Dispensing Chemists (and General Agents for the Improved Horse-Hair Gloves and Belts), 172, New Bond Street, London, and Sold by all respectable Chemists throughout the Empire.

WM. HALSE'S FIVE GUINEA APPARATUSES are now ready.—Invalids are solicited to send to Mr. W. HALSE, of 22, Brunswick Square, London, for his Pamphlet on MEDICAL GALVANISM, which will be forwarded free, on receipt of two stamps. In it will be found the particulars of cures in cases of asthma, rheumatism, sciatica, tic doloureux, paralysis, spinal complaints, headache, deficiency of nervous energy, liver complaints, general debility, indigestion, stiff joints, nervous disorders, &c. Mr. HALSE'S method of applying the galvanic fluid is quite free from all unpleasant sensation. Terms: One Guinea per week. The above Pamphlet contains his Letters on Medical Galvanism.

ASTROLOGY.—Persons residing in London, or elsewhere, can send any Address, Christian and Surname, and Age, in a letter containing 13 postage stamps, to Professor MELVILLE, Princes Road, Lambeth, London (the only Acrostic Astrologer in the universe), and they will receive by return of post, special poems on their names, in which their destinies will be revealed.

KNOW THYSELF!—Professor BLENKINSOP continues to receive from individuals of every rank the most flattering testimonials of his success in describing the CHARACTERS of Persons from their HANDWRITING, pointing out their mental and moral qualities, whether good or bad.—Address by letter, stating age, sex, and profession, inclosing 13 uncut postage stamps, to Dr. BLENKINSOP, 344, Strand, London.

QUALITY THE TEST OF CHEAPNESS.

BERDOE'S LIGHT OVERCOATS AND CAPES resist any amount of rain. One of the largest Stocks in London of Superior GARMENTS at Lowest Charges. First-Class DRESS COATS, 3*l.*; BOY'S SUIT, 11*d.* per inch, according to height.—96, New Bond Street, and 69, Cornhill. (Nowhere else.)

TO GENTLEMEN BOARDERS.—The Advertiser has a vacancy for one or two young gentlemen desirous of acquiring a knowledge of Agriculture in all its branches, the Breeding and Feeding of Stock, &c., &c., in one of the best cultivated districts in the kingdom, where they would have the advantage of an experienced neighbourhood, and a comfortable home.—For particulars, apply to A. Y., Office of this Paper.

BONES.—Any quantity of Boiled Bones may be had at Hazlehead Farm, near Penistone, Yorkshire.—For price and particulars, apply to Mr. ROBERT GARTSIDE, on the premises.

WANTED, A FARM.—To rent, from Michaelmas next, or Lady Day, 1855, a Farm of from 100 to 200 acres, with a good House fit for the residence of a gentleman with a small family; within six hours of London by railway, and near a station and town.—Apply by letter, with fullest particulars, to C. C., 66, Mark Lane, London.

GREENHOUSES AND PUBLIC-HOUSE.

To GARDENERS, FLORISTS, AND OTHERS.

TO BE LET, in the immediate neighbourhood of Gravesend, a large Greenhouse, Propagating-house, and a Range of Brick Pits; also a PUBLIC-HOUSE adjoining the same. The Stock of Plants to be taken at a valuation.—Particulars may be obtained of Mr. J. GOULD, 38, Windmill Street, Gravesend, Kent.

TO BE LET, a powerful WATER CORN MILL, in the parish of Brimpton, near Newbury, Berks, with an abundant supply of water, driving six pairs of stones, 4 feet diameter, with flour machine, two bolters, smut machine, &c., and a good Dwelling-house, with Garden, Yards, Stable, and other suitable buildings in substantial repair, and the machinery in good order and condition. A railway and canal both pass close by the Mill, and there is every convenience for carrying on a large business. The Mill is the property of Lord Viscount Falmouth, and is about two miles from the Woolhampton Station on the Hungerford Branch of the Great Western Railway, about 5 miles from Newbury and 13 miles from Reading.

Mr. THOMAS REYNOLDS, of Brimpton, will show the Mill, and further particulars may be obtained from Mr. SINCLAIR, 28, Southampton Row, Russell Square, London.

TO GARDENERS AND NURSERYMEN.

TO BE SOLD, by Private Contract, and the Premises LET, with immediate possession, by order of the executors of the late Mrs. MARY POTTS, the STOCK IN TRADE on the old established Nursery Gardens, Nantwich, Cheshire—Coming-in about 250*l.* The above Gardens comprise about 5 acres statute measure, and are well situate for doing a capital business, being within four miles of the populous town of Crewe, and about 10 miles from any other nursery gardens. There is a comfortable Residence and a greenhouse on the Premises, and 12 acres of good Pasture Land may be held therewith if required. Part of the purchase money may remain on the Stock.—For further particulars apply to Mr. W. FOWLES, Wall Fields Farm, Nantwich, Cheshire.—Nantwich, Feb. 18.

COUNTY OF TIPPERARY—BARONY OF LOWER ORMOND.

TO BE LET, from the 25th of March, with immediate possession, the following LANDS:—Ballylina, West Farm, containing 140 acres, Irish; Mathew's Farm (part of Ballylina, W.), 62 acres; Castleview Farm, ditto, 105 acres; Lismalin Farm, 190 acres; Ballynahinch Farm, 82 acres. These Farms are on the estate of Lord Ashtoun, and are situated about eight miles from Portumna, to which there is water-carriage; and the nearest station on the Parsonstown Railway, now in progress, will be at about six miles distance.

The Land is suited for tillage under the 4 or 5-course rotation. There are good slated houses on three of these Farms; and any other buildings, which may be reasonably required, will be erected by the landlord. Mr. JAMES EGAN, the Steward, at Sopwell Hall, near Shinrone, will show these Farms.

TO BE LET, partially furnished, the MANSION HOUSE OF WEDDERBURN, in the Parish of Dunse, and County of Berwick, containing a number of Public Rooms and Bed Rooms, suitable for a large family. There is a Park of above 300 acres, divided into Fields (let from year to year), most of which are in permanent pasture, the whole being surrounded by a high wall. A small Stream runs through the Park, which affords Trout Fishing; and the right of Shooting would be given, if required, over several arable farms. There are both Fox-hounds and Harriers in the immediate neighbourhood. The Dunse Railway Station is about two miles distant. A Lease could be given for five years, from Whitsunday 1854.

For rent and other particulars, apply to SANG & ADAM, No. 61, Great King Street, Edinburgh; or to ANDREW DUNLOP, Parliamentary Agent, 2, Broad Sanctuary, Westminster, London.

TO BE SOLD, a SEED BUSINESS in one of the principal towns in the North of England. The premises are situated in the best business part of the town, are extensive and calculated for carrying on a large trade.—For further particulars, or to treat, apply, with real name and address, to A. Z., Office of this Paper. N.B. A Nursery Stock may also be had at a valuation, if desired.

TO BE SOLD, a GREENHOUSE, 16 feet 6 inches, by 10 feet, including about 3000 Bricks, for 16*l.* In first-rate condition.—Apply at 1, Myrtle Villas, North Street, Wandsworth.

TO BE SOLD, BUFF COCHIN CHINA EGGS, from Birds that have taken prizes at the Derby, East Kent, Bristol, Taunton, and Yeovil Poultry Shows, at 1*l.* 1*s.* per dozen; also Partridge Cochin China Eggs, from Birds that have taken prizes at London Summer Meeting, Surrey Gardens' Show in August, Malvern, Yeovil, Honiton, and Torquay Poultry Shows, at 1*l.* 1*s.* per dozen.—Apply to JOHN R. RODBARD, Aldwick Court, Wrington, near Bristol.

LIGHT BUFF COCHIN CHINA FOWLS' EGGS.—An Amateur having a first-rate stock of Light Buff Cochin China Fowls from Prize Birds, and more eggs than he requires for his own use, is willing to part with a few sittings at a reasonable price—5*s.* 6*d.* per doz., box included.—Address "Chanticleer," Post-office, Farnham, Surrey.

CLEAR YELLOW COCHINS.—Eggs may be had from four pullets of "Sturgeon" blood, running with a cock bred by Mr. Fairlie, all pale yellow birds; 10*s.* per dozen, package included. Eggs from "commended" Spanish birds at the same rate.—E. T. A., Loddon, Norfolk.

SPANISH FOWLS.—Eggs from Birds which took Prizes at Southampton and Salisbury, themselves bred from Birds which carried off Prizes at Hitchin, Surrey Zoological, and Metropolitan Shows, crossed with one of Poole's best Cocks, may now be had at 2*s.* 6*d.* each, including Package, by inclosing a Post Office order, payable at Hartford Bridge, addressed to Mr. JOHN CLARKE, Shrub Cottage, Hartley Row.

AYLESBURY DUCKS' EGGS.

TO BE SOLD, EGGS warranted from the best selected White Ducks, good shape, bill and legs fine and a good colour, 6*s.* per dozen, including packing. Early application to secure them at the above price is necessary.—Apply to W. H. GREEN, Builder, Walton Street, Aylesbury.

TO BE SOLD, AYLESBURY WHITE DUCKS, 21*s.* each; Eggs, 21*s.* per dozen. Pure White Cochin Eggs, 12*s.*; Dorking Eggs, 8*s.* White Guinea Fowls' Eggs, 10*s.* 6*d.* Guinea Fowls' Eggs, 7*s.*—Apply to Mr. JOHN MARGESSON, New Road, Aylesbury, Bucks.

WHITE-FACED SPANISH FOWLS.

TO BE SOLD, at reasonable prices, a few COCKERELS and PULLETS of the above excellent Fowls, from Prize Hens and a Cock bred by Capt. Hornby.—Apply to Mr. JOHN READ, Church-yard, Boston.

TO BE SOLD, PRIZE PARTRIDGE SHANGHAES.—Two Cockerels and Two Pullets, birds which took first prizes at Surrey Winter Show, first prize at Bedford, also prizes at Norwich and Great Metropolitan Show. The Cockerels are Black-breasted, the Pullets beautifully marked. Price on application.—Also EGGS from Partridge Coloured Prize Birds at 20*s.* per dozen.—J. F. CHATER, Haverhill, Suffolk.

MR. GILBERT, of Grays, Essex, having entered into an arrangement with THOMAS STURGEON, Esq., for the Purchase of the whole of his remaining Stock of COCHIN CHINA Fowls, bred by him in 1853, Gentlemen and Amateurs are informed the Birds are now on Sale. Eggs may be had from the above birds at 20*s.* per dozen.

FANCY POULTRY.

EDWARD H. STRANGE, Ampthill, Beds., has for sale a few pairs of the following birds:—Black Spanish, from Captain Hornby's strain; Two Hen Birds obtained 1st, 2d, and 3d prizes at the Bedford Exhibition, 1853; Golden Pencilled Hamburgh and White-bearded Polands, first prizes were awarded to each of these varieties at the Hitchin and Home Counties Exhibition 1853; White and Buff Shanghaes, fine heavy birds; Silver Spangled Hamburgh, these birds gained a prize at the Bedford Exhibition.

E. H. S. will have a few sittings of Eggs from each of the above Fowls to sell, and from the Staffordshire pile Game, from birds that took a prize both at Hitchin and Bedford. Price, and other particulars, sent on receipt of a directed envelope.

Sales by Auction.

MRS. LYDIA C. STOW'S SPANISH, BUFF & BLACK COCHIN CHINA, & COLOURED DORKING FOWLS.

MR. J. C. STEVENS has received instructions to Sell by Auction, at his Great Room, 38, King Street, Covent Garden, on TUESDAY, Feb. 28th, at 12 o'clock, precisely, upwards of 150 LOTS of CHICKENS of 1853, including many prize and commended Birds of the above varieties, all bred by Mrs. Stow. The SPANISH FOWLS, consisting of about 40 Lots, include Birds which took 1st Prizes at Malvern, Southampton, and Birmingham, and are the progeny of her noted Bird CHAMPION, the winner of the 1st Prize at the summer Surrey Zoological Show, and will be the first she has parted with this season. The COCHIN CHINA CHICKENS were bred from Birds which have lately taken Prizes at Liverpool and Manchester. Aylesbury Ducks from 1st Prize Birds, &c.—Catalogues by enclosing a stamped directed envelope to Mr. J. C. STEVENS, 38, King Street, Covent Garden.

KENSINGTON.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are commissioned by Mr. Holland to sell by Auction, on the premises, Kensington Nursery, Gloucester Road, in consequence of the ground being let for building, on MONDAY, February 27, 1854, at 11 o'clock, the whole of the choice and well-selected FRUIT TREES, consisting of Standard and Dwarf trained and untrained Peach, Nectarine, Apricot, Apple, Pear, Plum, Cherry, Damson, Medlar, Mulberries, Gooseberries, and Currants: 3000 Standard budded Muscle Stock, worked with Peach, Nectarine, and Apricot; also Evergreens; a quantity of Rhubarb; Hand Lights, Wheelbarrows, and sundry effects.—May be viewed prior to the sale. Catalogues may be had on the premises; and of the principal Seedsmen in London; and of the Auctioneers, Leytonstone, Essex.

WOOLWICH.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are directed by the Widow of the late Mr. Henry Ward, to offer to public competition, by Auction, on the Premises, Bull Fields, Woolwich, on MONDAY, March 6, at 11 o'clock, the whole of his costly and justly celebrated STOCK of CARNATIONS and PICOTEES, comprising all the first flowers in cultivation.—May be viewed prior to the Sale. Catalogues may be had on the Premises; of the principal Seedsmen in London and of the Auctioneers, American Nursery, Leytonstone, Essex.

WOOLWICH.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. Williams to sell by Auction, on the Premises, Bowater Nursery, Woolwich, on WEDNESDAY, February 22, at 11 o'clock, without reserve, the lease having expired, and a portion of the ground being required for building, the whole of the NURSERY STOCK of Evergreens, Fruit and Ornamental Trees, comprising Aucubas, Bays, Laurustinus, Variegated Hollies, Fan Yews, Portugal Laurels, Standard Apples, Pears, Plums, Cherries, Gooseberries, Currants; Large Fruiting Pears, Apples, Cherries, &c.; Laburnums, Weeping and Common Ash, Walnuts, several beds of Asparagus, Vines, Evergreens in pots, together with a 23-light Pit; the erection of a capital shed, &c.—May be viewed prior to the sale; Catalogues may be obtained on the Premises; of the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

IMPORTANT AND ABSOLUTE SALE OF MAGNIFICENT SPECIMEN PLANTS.

MESSRS. PROTHEROE AND MORRIS are instructed by J. M. Yeeles, Esq., of Bathford, near Bath, to submit to public competition, by Auction, without reserve, on the premises, on WEDNESDAY, March 22d, at 11 o'clock, in consequence of his declining their cultivation, the whole of his unrivalled collection of SPECIMEN PLANTS, many of which are not equalled in this country as splendid examples of superior culture, and just in condition for the coming season's exhibitions. They comprise the best kinds of Ericas, Azaleas, Ixoras, Leschenaultias, Boronias, Pimeleas, Aphelexes, Eriostemons, and almost every kind of exotic plant worth culture for exhibition.—May be viewed the day previous to and morning of Sale. Catalogues to be had (6*d.* each, returnable to purchasers), of Mr. Glendinning, Chiswick Nursery; the principal Seedsmen in London; and of the Auctioneers, American Nursery, Leytonstone, Essex.

"	8 by 6 and 8½ by 6½	... ...	16 3
"	9 by 7 and 9½ by 7½		
"	10 by 8 to 12½ by 9½	... ...	19 0
"	12 by 10 to 24 by 14		

Orchard House Squares on Mr. Rivers's approved plan, to whom I have sold some thousands of feet:—20 inches by 12, 20 by 13, 20 by 14, 20 by 15, 20½ by 12½, 20½ by 13½, 20½ by 14½, at 19*s.* per 100 feet.

200 feet cases at 42*s.*, and 300 feet case 63*s.*, in large sheets.

Boxes charged 1*s.* extra per 100 feet, and the same allowed if returned free of all charge.

HARTLEY'S PATENT ROUGH PLATE GLASS, Fern Shades, Striking Glasses, Milk-pans, Bee Glasses, Cucumber Tubes, Sheet and Rough Plate Glass Tiles, Wasp Traps; Plate, Patent Plate, Crown and Sheet Window Glass, in every thickness and quality, and Ornamental Glass, plain and coloured; pure white Shades for Ornaments, Crystal Glass for Pictures.

Warehouse, 87, Bishopsgate Street Without—same side as Eastern Counties Railway.

HARTLEY'S PATENT ROUGH PLATE GLASS, 1-8th thick, or 2 lbs. to the foot; 3-16ths, or 3 lbs.; and 1-4th, or 4 lbs. to the foot, for Ridge and Furrow Roofs, Greenhouses, Railway Stations, Engine Sheds, Mills, Market Halls, and Public Buildings generally.

For further information apply to JAMES PHILLIPS & CO., London Agents, 116, Bishopsgate Street Without.

"ROUGH PLATE GLASS.—I have given the rough plate 12 months' trial, and I find it answer better than any other glass I have in use; the plants keep more dwarf, and the foliage is of a better green. I do not find it to collect more dirt, and the condensed vapour runs down it quite as freely as on other glass. If I build more new houses, I shall certainly use HARTLEY'S Rough Plate. I purchased what I have had of Messrs. Phillips and Co. I have two houses glazed with it, which can at any time be seen at my nursery."—*N. Gaines, Surrey Lane, Battersea.*

BY HER MAJESTY'S ROYAL LETTERS PATENT.

ALFRED KENT'S PATENT WEATHER-PROOF GLAZING WITHOUT PUTTY.—For Horticultural Buildings in Wood or Metal.

HORTICULTURAL BUILDING WORKS, CHICHESTER.

Illustrated Books describing inventions, containing prices and particulars relating to the different designs, sent on receipt of four postage stamps. Nurserymen and others appointed agents on application.

Horticultural Buildings upon this plan having been erected in many different parts of the country, and having stood the trial of all weathers, and more especially the severest of all, viz., frost, A. KENT, with full confidence, strengthened by the many flattering testimonials he has received, can safely guarantee the proper working of his Patent System of Glazing. Estimates and Plans sent, including Heating by Hot Water.

LACE GLASS.

IMPORTANT ANNOUNCEMENT TO HORTICULTURISTS AND FLORISTS.

R. AND W. SWINBURN AND CO.'S PATENT LACE GLASS.

ALFRED KENT, HORTICULTURAL BUILDER, Chichester, having called the attention of the Manufacturers of this article to its great value in Horticultural Buildings in general, begs leave to place before the Public the advantages which will be found in the use of this Glass in the place of Rough Plate and other obscured glass. 1st. It is only partially obscure, the sun's rays being admitted freely through the transparent parts, whilst the obscured parts sufficiently divide the sun's rays to prevent burning. 2d. From its being of an even surface and regular thickness, it is as well adapted for first-class buildings as for commoner purposes, no sun-shade or network covering being required, and the constant gloomy appearance of obscured glass will be avoided.

For Tariff List of Crates and Squares, address ALFRED KENT, Horticultural Builder, Chichester, who is appointed Sole Agent for the sale of this Glass.

TO AMATEUR GARDENERS, LOCAL BOARDS OF HEALTH, & SANITARY WORKS.

PATENT GLASS TUBES, Iron Coated with Glass, Gutta Percha, Combinated ditto, Patent Flexible India Rubber Tubing, and every other Hose for Watering Gardens. The Hydraulic Ram, Fire, Garden, and every other kind of Pump, Sluice Cocks, Hydrants, High Pressure Cocks, and all other articles to be had, Wholesale and Retail, of

FREEMAN ROE,
HYDRAULIC ENGINEER,
70, Strand, and Bridgefield, Wandsworth.

CURE FOR MILDEW ON GRAPES.—In consequence of the increased prevalence of mildew on the Vine during the last few seasons, GEORGE TABER, of Rose Cottage Rivenhall, near Witham, Essex, practical Gardener and Florist has directed particular attention to the best mode of preventing it, or for curing the Vines that have been attacked, and he now begs to announce that he has succeeded in preparing a composition known as TABER'S ANTI-MILDEW COMPOSITION, which will effectually prevent or cure the disease without doing the slightest injury to the Vines; and any person, by aid of the printed instructions given, may use it without risk. Mr. TABER has in his possession testimonials from several gentlemen whose Vines have been cured, and he has completely protected his own Vines for several seasons. Sold in packets containing 3 lbs., 2*s.* 6*d.*, or 7 lb. packets, 5*s.*; delivered free to the Witham or Kelvedon Stations on the Eastern Counties line. Post Office orders to be made payable to GEORGE TABER, drawn upon the Witham Post Office. Postage stamps received in payment of small orders. The trade supplied on the usual terms.—Address GEORGE TABER, Rose Cottage, Rivenhall, near Witham.

HEAL & SON'S ILLUSTRATED CATALOGUE of BEDSTEADS, sent free by post; it contains designs and prices of upwards of 100 different Bedsteads, in iron, brass, japanned wood, polished birch, mahogany, rosewood, and walnut tree woods; also of every description of bedding, blankets, and quilts.—HEAL & SON, Bedstead and Bedding Manufacturers, 196, Tottenham Court Road.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener. Sundays excepted.

Priced lists of plant tubs and boxes forwarded on application.

HORTICULTURAL BUILDINGS, ROCK AND RUSTIC WORK, ORNAMENTAL WATER, FOUNTAINS AND FALLS, AND LANDSCAPE GARDENING, executed on the best principles; Estates Improved, Land Laid Out for Building, &c., by Mr. GLENNY, Valuer, Estate and Horticultural Agent, 420, Strand.

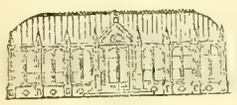
GREEN AND HOTHOUSES made by machinery at J. LEWIS'S HORTICULTURAL WORKS, Stamford Hill, Middlesex. Warranted of best materials; being made by steam-power, they are put together in a superior manner; one trial will prove these Buildings to be the cheapest and best made in England. 10 in. Greenhouse lights at 3*d.* per foot; 2 in. at 3½*d.* per foot. Lists of Prices by enclosing two postage stamps.

HORTICULTURE IN ALL ITS BRANCHES.

J. WEEKS & Co., King's Road, Chelsea,

HOTHOUSE BUILDERS.

The Nobility and Gentry about to erect Horticultural Buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's Road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.



The HOT-WATER APPARATUSES (which are efficient and economical) are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation.

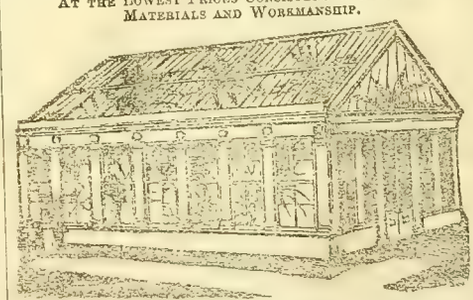
The splendid collections of Stove and Greenhouse Plants are also in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots, from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.

J. WEEKS & Co., King's Road, Chelsea, London.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

AT THE LOWEST PRICES CONSISTENT WITH GOOD MATERIALS AND WORKMANSHIP.



GRAY AND ORMSON, Danvers Street, Chelsea, London, having had considerable experience in the construction of Horticultural Erections, which, for elegance of design, good materials, and workmanship, combined with economy and practical adaptation, cannot be surpassed by anything of the kind in the country, are in a position to execute orders on the lowest possible terms.

G. & O. have been extensively employed by the Nobility, Gentry, and London Nurserymen; and to all by whom they have been favoured with orders, they can with the greatest confidence give the most satisfactory references.

Their Hot-water Apparatus is also constructed on the most approved and scientific principles, for all purposes to which the application of Heating by Hot Water can be made available.

BY HER MAJESTY'S ROYAL LETTERS PATENT

E. DENCH, PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

PATENT HOTHOUSES and excellent Glass at 1*s.* 3*d.* per foot super., which are superior to all others for price with quality, and if known would supersede all others. (See Appendix, in "Book of the Garden," by Mr. M'Intosh.) A Range of Houses and Hot Water Apparatus, was erected by E. D. for E. L. Betts, Esq., Preston Hall, Kent. Mr. J. Frost, head gardener, has shown their efficiency by their produce at the Royal Botanic Gardens, Regent's Park, June 8, and Chiswick, June 11. The editor of the *Gardeners' Chronicle* says: "Beautiful examples of Black Hamburgh, large both in bunch and berry, and as black as Sloes, were furnished by Mr. Frost, gr. to E. L. Betts, Esq., of Preston Hall, Kent; these well deserved the first prize which was awarded them."—*Gardeners' Chronicle*, June 18th, 1853. The Grapes were considered the best shown at Regent's Park during the season, and the Houses are as superior for the growth of everything else in horticulture, which has been fully proved, and they have been extensively erected for the nobility and gentry in all parts of the kingdom.

GLAZING WITHOUT PUTTY.—Iron and Glass alone. E. D. has Roofed the Public Baths and Washhouses, Endell Street, on this principle, and others are in hand. Patent Sashes for Peach Walls, Pits, &c., 8*d.* per foot super. Heating by Hot-water, on the most practical principles, and all the best materials used. Printed Price List sent on application.

HOTHOUSES, CONSERVATORIES, FRAMES & LIGHTS, FOR PITS, CUCUMBER & MELON BOXES & LIGHTS.
